The Court could not say that 50ft. any more than 40ft. or 30ft., was an unreasonable limit. Thirdly, it was said that the 50ft. limit was unreasonable because it would be destructive of property, because, in a case in which there was no sewage system and a cesspool was necessary, it would be impossible to make one if the extent of the property did not permit of its being 50ft. distant from the house. The answer to that was that, if there were already no cesspool, there would be no destruction of property; and, if there were one, the owner was not obliged to move it. Lastly, it was suggested that the bye-law would tend to prevent the improvement of property. His Lordship doubted very much whether the Court could hold the bye-law unreasonable on that ground, for the Court was not in a position to say what was or was not for the public interest in sanitary matters. The appeal must be dismissed.

### NEWGATE STREET IMPROVEMENTS.

EVERYONE will be pleased to see the improvement lately completed at the corner of Newgate Street and St. Martin's-le-Grand, writes a correspondent, where a large slice of the triangular area in front of the Post Office has been cut off and the roadway considerably widened. Another improvement of decided value but moderate cost would be the opening of a thoroughfare through Great Turnstile from Lincoln's-Inn-Fields into Holborn, opposite Featherstone Buildings. It is not necessary to make a vast opening; all that is needed is to widen the present foot passage into a 40ft. road, so as to allow cabs, carriages, and carts to go through. The proposal of the London County Council to form a new thoroughfare 100ft. wide from Holborn to the Strand with two or three branches appears to us highly extravagant and unnecessary. Chancery Lane already accommodates a great deal of traffic, though in parts it is less than 40ft. wide. Why then should a new thoroughfare be 90ft. or 100ft. wide? Drury Lane requires improvement, no doubt, especially at the Strand end. If a few houses were taken down in Holborn and a recess or circus made, that would be all that is needed there. There is no solid objection to the new street passing through the west side of Lincoln's Inn Fields, which would save nearly half the total cost. Many years ago we suggested that the new street should pass from Lincoln's Inn Fields straight through Clare Market to the north end of Newcastle Street, which is about the same width as Chancery Lane, and so into the Strand. In this way a new thoroughfare from Holborn to the Strand would cost less than a quarter of a million instead of two millions. The County Council made the greatest mistake any corporation could make when they refused the offer of the Hotel Cecil at £400,000. The ground alone was worth nearly all the money, and the immense building of 1200 rooms would have afforded all possible accommodation. If a few alterations were expedient they could have been made at a small expense. But, no doubt, the great objection was that the building was scarcely visible from the Strand, and Council members could not well point out "what a grand palace we occupy!" Now, forsooth, they want an expensive site, the most expensive they can find, and at the West End, where they can build a great edifice at an outlay of £750,000!

## MEDIÆVAL FRENCH FORTIFICATIONS.

By D. THEODORE FIFE.

NOWADAYS we often hear the query, "Is Architecture a progressive Art?" Of course the only answer is, "Does it or does it not keep up with the life of the times?" Assuming, then, that the Architecture of to-day fulfils this condition, another question rises: "How are we, who are concerned with a present, to treat the work of the past?" The wrong way to do this is to study that past work quite irrespective of the conditions under which it was created, and quite forgetful of

chief's dwelling, evolving into the château of later times, and to comparatively ignore the fortification of the walls of towns, as in the latter the idea of comfort cannot be of any importance. With these few remarks, I will now proceed.

The term "Mediæval" begins with the retreat of the Romans from Western Europe during the fifth century. The great power of Rome, the last relic of what we might call the ancient world, was then falling in ruins, and the second great world-age began. The scattered, half-barbarian tribes of Visigoths, Vandals, and Ostrogoths now started to build their future greatness on the foundations laid by the Romans. It is difficult to imagine that the same men, or at least the same races of men, who built the Churches, Cathedrals, and Abbeys of the succeeding centuries built also the massive walls and towers which we find in their military remains. But it is one of the wholly inexplicable things of these times that men who were possessed with such a fervour of religious zeal were also, as far as we can possibly judge, cruel, semi-barbarous, unscrupulous, and for the most part entirely wanting in the peaceableness of professedly Christian nations.

If we consider the Art of defensive warfare at this time, we will see that, when a stronghold was invested, the chief endeavour of the besieged was to keep back the enemy from the walls. This principle governs the entire Art of fortification till the time when cannon became extensively used. Almost all the improvements effected during the twelfth, thirteenth, and fourteenth centuries are to give the besieged more control over the actions of the attacking force.

I will divide this essay broadly into three headings: first, early fortified buildings from the beginning of Mediæval times to the twelfth century; second, twelfth and thirteenth century

## PROVINS-KEEP

PLAN.  
FIRST FLOOR LEVEL

Scale: 0 10 20 30 40 50 60 70 80 90 100 Feet

buildings; and, third, fourteenth century buildings and after. This is rather a rough classification, but the best, I think, for the scope of this paper. And be it understood that many of the buildings to which I will refer are very much ruined, and, though the idea is there in every case (in some cases complete), in many cases it is only through the medium of those who have diligently studied this branch of history, such as M. Viollet-le-Duc, and from references and illustrations by Froissart and from ancient tapestries, that anything like a reconstruction can be effected.

The first forts of Mediæval times consisted merely of a paling or palings inclosing a piece of rising ground with the chief's hall in the

the steps which bring it to our own time. These are precisely the points which must be studied if we are to derive any benefit from the historical side of our Art. We Scotchmen have a style which surely should concern us more than most others. This paper, then, will deal with a few of the origins of that style in a brief and consecutive manner. As the value of anything depends on the point of view, so this slight sketch taken as so much information about past buildings crammed down one's throat is practically worthless, but looked at as a chapter of history showing the progressive value of real forms may be of some gain.

Planning is of two kinds—the first, in which the plan includes the whole building, typified by bridges and forts; and the second, in which it does not, strictly speaking, include the whole building, typified by Cathedrals, &c. In the first the forms are all constructive or essential; in the latter they are not so. It has been well said that good planning is certain to be found in any truly great period of Architectural history. The period which I have chosen to-night is one of the greatest in the history of the world. This is thoroughly recognised in our appreciation of the Ecclesiastical work of the Middle Ages; but that other work of this period, the fortified tower, slowly evolving into the modern château, in which necessity is so truly the mother of invention, contains much of the gold of this great period, especially in that essential planning of which I have spoken, and certainly cannot be left out of account in a complete study of that time. I have taken France as being, on the whole, the country which best illustrates the subject, for what we now call France was the great clash-point of the Northmen, or Normans, and the Southern Gothic or Lombardic nations, and here Mediæval Architecture as perfected in the Pointed Style undoubtedly had its origin. England contains quite as many examples of fortified strongholds as France, but it is to the latter country we must go first, as the buildings in this country were more or less borrowed from French examples. I also intend to speak almost entirely of the domain, or

PROVINS KEEP. TWELFTH CENTURY.

centre, and were always built of wood. It would be interesting to follow the progress of these early forts till the time when they were built of stone, but it would be very difficult to do so, owing to the perishable nature of the material employed. Besides, they only mark the early struggles of semi-civilised peoples, and are too rude to be of any use to us now. I will therefore skip over the sixth, seventh, eighth, ninth, and tenth centuries, and start with the first stone fortified buildings. These were probably first built by the Normans in the north of France, who, vigorous, energetic Northmen as they were, gradually began to dominate France and supersede the more degenerate southern tribes. At the beginning of the eleventh century, then, the Normans began to build keeps or towers of stone with enormously thick walls; these are almost all rectangular on plan. It is probable that they generally had foreworks or protecting walls connected with them, but these in many cases have disappeared. If these keeps served for dwellings as well as strongholds, as is most likely, we can see from them how rude the life even of the higher classes was at that time. Their planning is very simple, each floor consisting of one room, or at most two. They are often several stories in height, and have wood floors, which are reached by a stair in the thickness of the wall. The windows of these early buildings are nearly all round-headed, some of them with rude attempts at enrichment. One would almost imagine that the windows would be extremely small in these massive structures, but the contrary is very often the case. This must be because the offensive engines of war had not yet properly developed, as openings afterwards became very small. The walls run right up without a projecting parapet of any kind, and are usually provided with flat buttresses and pilasters. It is curious to note that, externally, buildings

## CHATEAU D'ETAMPES

PLAN

12<sup>th</sup> CENTURY

actually became simpler as time went on, and these wall projections were discarded altogether. As there were no vaults in the very early keeps, except possibly a rude barrel vault in the basement, these buttresses were of no real use, and must therefore have been chiefly for ornament. The entrance door was usually at the first floor level, and reached by a ladder or bridge which could be removed at will. This was the safest method of entrance at a time when the enceintes or inclosing walls had not developed, and the keep constituted all the defence. Good examples of these square keeps of the eleventh century are to be found at Beaugency, on the Loire, and the Château d'Arques, in the North of France, built by a brother of William the Conqueror in 1039.

The pointed arch had hardly yet appeared as a constructive expedient in the north of France, and in the south only locally, as at that most interesting Church, St. Front, at Périgueux, and other examples in Aquitania, where its appearance was probably due to Moorish influence. Northern forts of this time must, of course, be called Norman, and are therefore practically Gothic, but those of the south are undoubtedly Romanesque; the Classic spirit, indeed, pervades the buildings of the south till a much later period than this, and was the origin of those beautiful, almost distinct, styles of the southern French Provinces. In Germany and Lombardy at

this period a very characteristic round-arched style prevailed, which originated with the hardy Northern races who superseded the barbarians subject to Rome. Very shortly after the time of the earliest Norman keeps this style had reached its perfection in the Cathedrals of Worms, Spire, &c. French Gothic influence soon became too strong, however, and the pointed arch prevailed in Germany, as elsewhere.

To return to France, in summing up the characteristics of these early buildings we are confronted by the rectangular plan of the keeps or towers. Why they were planned this way rather than round is hard to say. I am inclined to think that the Normans, who first built these keeps, must have set the example, and built what their own rude tradition taught them. Certainly the round form was quite well known even at this early date, as we see in the round towers of Ireland, for example. But, all the same, the round form was the exception then, and not the rule, in all Architecture.

The second division of the subject begins with the twelfth century. By this time the feudal system had got properly under way, and the power of the nobles had increased to an alarming extent. The social system, indeed, of this time consisted of a nominal sovereignty hardly, if any, stronger than the power of the barons of the various domains. These barons were supreme in their own right, perfect despots, each with his train of knights, who, again, had their followers and retainers. At the same time commerce increased, and the middleman, though contemptuous enough to the aristocracy, became a distinct item—partly brought about, I am tempted to think, by the Crusades and the consequent absence of the nobles.

Fortified buildings therefore came to be of two classes—the walled town with its palace or castle, and the isolated baron's fortress forming the nucleus of a feudal town. To the twelfth century, and particularly the latter half, belong some of the most interesting fortified remains in France. Conspicuous among these is the Château Gaillard, near Les Andelys, on the Seine, built by our own king, Richard I., in his war with the French after his long exile. According to M. Viollet-le-Duc, this castle shows Richard to have been an engineer and strategist of a high order, and certainly at the time of its erection it was considerably in advance of anything that had been done before.

## CHATEAU DE COUCY

PLAN

13<sup>th</sup> CENTURY

Other castles of this period are those of Gisors, Provins, and Etampes, all of which exhibit peculiarities which show the rapid evolution of more complicated means of attack and defence.

As the system of offensive warfare became more pronounced, the old square form of keep with vertical walls was found to be unsatisfactory; though quite good for a passive resistance, it offered no scope to the besieged, and the angles were weak points. Consequently three great improvements were effected in planning. (1) The angles of the square towers were rounded off; (2) wooden hoardings were brought out from the wall at the parapet to enable the besieged to cover all the walls; and (3), lastly, the inclosing walls of keeps were made in themselves strongly defensive, and were strengthened by flank towers. I will now treat these improvements in detail.

1. The keeps of Etampes and Provins are extremely interesting examples of transition

SECTION OF  
OVERHANGING  
PARAPET

from the square to the round form. The latter especially shows a great improvement on previous examples. There is something about the plan of this keep which one cannot help admiring—a unity, a perfect

economy of space, a perfect adaptation of means to end. The upper part has been restored in comparatively modern times, but the keep is there, in all essentials, as it was originally designed in the twelfth century. Though these keeps are a decided step in advance of the rectangular form, the complete circular form was soon arrived at, as we find it in the Castles of Coucy and Montargis of this era, and subsequent examples in the fourteenth century.

2. The second improvement was the system of wooden hoardings built out from the walls. This was a very important innovation, for to its development we owe the corbelled parapets which afterwards became so common, and which we are accustomed to think of as purely ornamental. For the sake of clearness, I will go a little in advance and follow its development. The wood hoardings were really covered balconies, and were for the primary use of giving the besieged a complete overhanging walk to enable them to visibly defend every inch of the walls. Distinct and unmistakable traces remain in many old buildings of the holes, at regular intervals, for supporting the main cantilevers of these hoardings. To give them a more permanent form they soon began to be carried on stone corbels which supported tilted struts carrying the platform. Finally, in the fourteenth century, as engines of war became more dangerous and incendiary in their character, wood was completely abandoned as a constructive material, and the use of stone brought the parapets to the form shown in the section (in which the wall is recessed back, and large corbels are used with a small space between the outer parapet and the main wall, which was used with deadly effect by the garrison). In this way these parapets became highly ornamental, and the principle was carried out in the French and Scotch Renaissance styles, where it is used in the endless variety of ways we now see, and I think it is most probable that all very projecting parapets of future buildings are derived from this defensive idea of wood hoardings. Gothic Architects, in their ecclesiastical work, discarded this projecting parapet, merely using string courses and corbel tables as a finish at the top of their walls. Neither was the idea carried far into the Renaissance, except in Scotland, as it was soon superseded by the Classic crowning cornice. A good example of a projecting parapet is shown in the Tour du Pont at Villeneuve, erected by Philip the Fair in 1307. We have several good examples in Scotland and England, such as Clackmannan Tower, Warwick Castle, &c.

We must now consider the third point in connection with twelfth and thirteenth century fortified buildings, namely, the improvement on inclosing walls and the towers thereof. Perhaps the Château Gaillard, before referred to, marks the first bold step in this respect, and the effect of the wall from outside is very striking, besides showing a vast improvement in the art of defence. Nothing, indeed, could be more admirable than the way in which the wall surface is broken up, necessitating corresponding breaks in the attacking force, and thus affording opportunities of flank attack by the besiegers. The manner, also, in which the keep of this building is designed exteriorly is very original, and was not imitated in any future example that I know of. It shows, by the system of arching at the top of the tower, a rude beginning of the future battlemented parapet, while the flat buttresses died away near the foot, so as to offer no security to the besiegers. On plan it can really be called a round tower, but the weakest side has a beak or horn, necessitating an enormous mass of masonry, the wall here being 24ft. thick. The whole keep is one of the original things in this most original design, which is unique in France, perhaps because the Frenchmen were too proud to imitate a building by an Englishman.

In connection with the inclosing walls of buildings we also note that isolated towers were distributed round them at intervals, subsidiary to the main keep, and often connected to it by drawbridges. These

towers afforded harbourage for small garrisons, who could defend the various parts of the wall. They afterwards developed in a very important way.

We now come to the perfected feudal fortress with round keep as we see it in the castles of Coucy and Montargis. The former Viollet-le-Duc calls it the grandest military structure in Europe. The great donjon is of majestic proportions, being 95ft. in diameter, 215ft. high, with walls 25ft. thick. It would be most interesting to go into the details of this building, as being, on the whole, the best example of a great feudal castle in France, but it would be rather outside the scope of this paper, so I will confine

cannot say much, but of general forms we must note the highly effective one adopted for town gates, where the door or gate proper is placed between two round towers projecting from the face of the wall. This was extremely useful for defence purposes, and was evidently derived from the observation of the use of the isolated wall towers to which I referred before. This idea afterwards produced many beautiful and imposing forms, and became an important feature in Scotch Renaissance work; we see it in Falkland, Rowallan, and other examples.

The next division of the subject deals with the buildings of the fourteenth century and after. During a great part of this time France was one vast battlefield. First came the campaign

TOUR DU PONT, VILLENEUVE.

myself to one or two remarks. The keep is one of the best examples for showing the stone corbels which supported the struts of the wood hoardings before referred to, and the large size of the openings in the attic story almost shows that some means of defence must have been employed to guard the besieged at this part. The plan shows a typical arrangement of the buildings of a great château of these times; the castle was built in 1223.

This was a most important period in Architectural history. In France it produced the best parts of Notre Dame, Chartres, Rheims, Amiens, and other examples too numerous to mention. In this country, Westminster Abbey, Salisbury, Lincoln, and parts of many other great buildings. In Italy, the thirteenth century saw the introduction and climax of the Pointed style. As Fergusson says, this was perhaps the greatest building epoch the world has ever seen. That which we call "Medieval" was then in its fullest perfection. The pointed arch dominated the Architecture of all the principal countries of Europe. That restless spirit of the great revival that was soon to shake all the Western world was as yet slumbering, and the perfect age of chivalry and knighthood, which is the *beau idéal* of modern Medievalists, reigned supreme.

Of the details of fortified buildings we still

of Edward III. of England, and, not long after, Agincourt, the Bedford Regency, and the rallying of the French under Joan of Arc. The misery of the country was such that comparatively few castles were built during the fourteenth century. To this period belong the Tour du Pont at Villeneuve, already alluded to, and the Château de St. André, Villeneuve lez Avignon. We now see the corbelled parapet projected and built entirely of stone. If we look at this Tour du Pont, we will see also another feature which was now generally used whenever the square plan was adopted. This was the bartizan, which not only strengthened the upper angles very considerably, but served as a stable for the garrison to protect the angles, which were the weakest parts, in a very efficient manner, for which purpose it had loopholes like the ramparts. Nothing in the whole history of the Architectural significance of these buildings can be more striking than the use made of this feature, more or less modified, in future times. Hundreds of examples can be pointed out in this country alone, and there is no detail which has had such an unconscious development. The fortified building, as exemplified in this tower, has now become a thing of beauty.

During the comparative lull which took place about 1400, the unfortunate Duc

CHATEAU GAILLARD.

d'Orleans built the great Château de Pierrefonds, which is very interesting as showing the transition from the old keep used purely as a stronghold to the mansion houses of Renaissance times. This transition marks a new spirit in the temper of the age. Great nobles were mixing more together, all classes were getting more refined and luxurious, and life and property were safer than formerly; a need was felt, therefore, for a dwelling which could be comfortable and at the same time capable of standing a siege. From this time onward, the defensive fort gradually merged into the private house, in which the Architectural characteristics of stormier times were merely used as ornaments.

The first step was the abandonment of the keep, and the substitution instead of groups of smaller towers, which were connected by covered passages. The outer wall of these passages was really the enceinte of the feudal castle carried up to a greater height. Thus the appearance of a stronghold was entirely changed. Under the old system, comparatively low enceintes strengthened by towers inclosed the various buildings of the château proper, over which the great keep towered up. The principle which governed this mode of defence was a universal distrust and suspicion which every man had for his neighbour. The lord of the castle and a picked garrison could shut themselves up in the great keep when all the rest of the town or castle was taken. This system, however, was soon found to be defective; it left the château too open, when taken as a whole, and no one was properly safe unless inside the keep, "with all the ropes cast off," so to speak. An instance of this occurred at the Siege of the Château Gaillard by Philip Augustus in 1204. After storming the forework A, and possessing themselves of that part of the building, the French succeeded, with incredible difficulty, in placing a battery against the entrance to the Enceinte. After storming this, they rushed in with such impetuosity that the garrison were completely surrounded before they could get back to the keep, and were forced to surrender. Under the new system the building presented the aspect of a four-sided building consisting of one vast wall strengthened by massive towers. The building thus became one whole, and the

towers became so many places of final retreat in the event of a siege. Another advantage of the new system was the increased comfort it afforded in times of peace. The covered passages rapidly became splendid suites of rooms; the buildings gradually lost their defensive character and softened down into the baronial residences and great châteaux of Francis I. time. The two systems are very well illustrated by comparing the plans of the Château de Coucy, built in 1223, and the Château de Pierrefonds, built in 1400.

Thus in these civil buildings Gothic faded imperceptibly into Renaissance, and we see a constant development, apart altogether from the Classic influence from Italy (which only affected the details), from the Norman keep of Early Gothic times to the great Renaissance château. In early Norman times religious and civil buildings were almost identical in style; as time wore on, Ecclesiastical work, rejoicing in the pointed arch and the constructive expedients thereof, struck off on its own tack, and worked out the beautiful creations of the Middle Ages. All the more strongly, therefore, it felt the shock of the New Classic Revival, as we see in the first Renaissance Churches, such as St. Eustache, Paris. There was something terribly inappropriate in Classic details being used for buildings whose constructive motto was "perfectly balanced roofs with practically no supports." With the growth of civil buildings Gothic forms were abandoned, and the château, which had gone right on in an unbroken development from the earliest Mediæval times, became Classic, like everything else. A last home was found for the fortified style in Scotland,

where it was developed in a most noble manner into a thoroughly national style which we as Scotchmen should be proud of. In no other country but Scotland, indeed, did this style ever become a comfortable domestic one; in France, the pure Classic had taken such hold that the fortified style was abandoned whenever the extensive use of cannon necessitated the building of special town fortresses. In England, also, the traditions of Mediæval times quickly vanished away, owing, no doubt, to the comparative peacefulness of the country, and the outcome of the

fortified stronghold, there, was the Elizabethan manor house. I think there can be no doubt that Scotland holds its own in the vigour of its domestic buildings against any country in the fifteenth and sixteenth centuries; compare, for instance, the manliness of Crathes or Midmar with the comparative tameness of an English Tudor manor house. In all these countries, however, the château had now lost its defensive character, and therefore, for us, the history of Mediæval fortification ends here.

A glance at the plan of the châteaux of Chambord and Bury will be interesting as showing the French Renaissance development of the fortified building. In these we still see the long, gallery-like buildings inclosing a courtyard, but the château proper is now massed into one block which forms the key to the entire plan. The flanking towers are now usually confined to the angles, and are often made square on plan for convenience sake. The plans of some of the early keeps we have considered are very interesting. I have already called attention to the plan of the keep of Provins. The first floor was the dwelling-house, the upper floors being reserved for defence, and the lower one containing vaults. M. Viollet-le-Duc has restored this keep with projecting hoardings on four faces of the upper floor, which, if correct, must have made it very formidable. The plan of the keep of Coucy shows internal buttresses to take the thrusts of the vaults. This was to leave the outer wall round, without any projections. The keep of Montargis is planned on the radiating system, and, though very good, has not the unity of the keep of Coucy, though it is certainly more comfortable. Coucy and the Château Gaillard are the two grand examples of towers built for defence alone. Considering that it was entirely built in a year, the Château Gaillard is wonderful. The prodigious forework shown on the plan seems to be of little use for defending the eye of the system; but we must remember that all round are precipitous cliffs, and at A is the only tongue of land which is anything like level, and therefore available for an army. In the great siege which this castle sustained from Philip Augustus in 1204, it was actually

SKETCH OF PART OF ENCEINTE. CHATEAU GAILLARD.

this forework that was captured first and stormed.

In this paper I have tried to show how intimately the Architecture of the times, as seen in these buildings, is connected with the life of the times. I think we are far too apt to consider only the final stages of our traditional ornament, without considering how it got there. Mr. Russel Sturgis, in the preface to his admirable new book on European Architecture, leaves out of account permanent military buildings, as having no influence on decorative Architecture. This I cannot agree with. In almost every case, we have seen to-night, the useful made the beautiful. For example, this keep of Provins is absolutely governed by principles of utility—that is to say, it was designed in the same way that a bridge is, or ought to be, designed. Not a feature here but is strictly made for its purpose, the whole forming the expression of the foremost thought in military engineering at the time it was built. And the result is a building with some claim to beauty, and interesting and venerable because a step to higher forms. Again, take the idea of flanking towers as represented by the Narbonne gate at Carcassonne. How admirable is this idea for defence! An attacking party, if presenting themselves before this gate, can be doubly attacked in flank by the occupants of the towers. The gate is secure as long as the towers stand. The bartizan is another example; its invention is also backed by a useful principle—we find its form with us to-day.

If the subject of this paper is rather remote from present-day practice, it is essential to a proper understanding of the times. Only by studying all forms of an Architectural age can we appreciate the proper value of the various forces and laws which govern styles, and the use of this member, the origin of that. Only thus can we see how the Architecture of past times at its best was dependent on the conditions of the age. It is needless to point the parallel. If our Architecture is to be real, to be vital, it must be the outcome of an intelligent understanding of the wants of the age. This can be the only true Architecture. To slavishly copy a style is as bad as ignoring the value of any one style. All styles are ours now. Let us use them intelligently.

Steps are being taken for the erection of a new Congregational Sunday school at Shaw, near Oldham, in place of the one recently destroyed by fire. It is proposed to build a school, with accommodation for 500 scholars, at a cost of £1400.

The proposal to illuminate the dome of St. Paul's on Jubilee Day is viewed with apprehension by some persons careful for the safety of the structure. Sir F. Dixon Hartland has called Sir M. W. Ridley's attention to the matter, and suggests that the enterprise shall be prohibited.

WITHIN a few weeks the latest addition to the list of the Gordon hotels will be opened at Folkestone, under the title of the Hotel Metropole. The hotel is situated on the Lees, in one of the finest positions in Folkestone, and stands in its own grounds of some four acres. It contains accommodation for 350 visitors, and comprises dining halls and drawing rooms, a library, and many fine suites of private apartments.

THE Architectural Association Notes for June are perhaps more than usually interesting. The Editor has a short article on the Jubilee celebrations of the Association, and a brief biographical sketch of Mr. Hampden W. Pratt, the newly-elected president. Professor T. Roger Smith contributes an article on "Architecture as Learnt in Schools of Art." Mr. Henry J. Leaning and Mr. H. D. Searles-Wood write under the heading "Classifying Builders' Work"; Mr. R. S. Balfour discourses on "The A.A. Travelling Studentship Competition Drawings, 1897"; and, in addition to a report of a paper on "Dodges," read by Mr. Henry Rose before the Discussion Section, other matters appertaining more closely to the Association are fully dealt with.

#### HUDDERSFIELD SEWAGE WORKS.

QUITE recently a Belgian deputation inspected the Huddersfield sewage works, and on their departure registered in the visitors' book their impression of what they had seen in the terms—"A perfect installation, deserving of commendation." The works were designed by Mr. R. S. Dugdale, C.E., the Borough Surveyor, and passing the entrance gates, on the left is found the weigh-office and on the right the valve chamber, fitted with sluices by which the entrance of sewage and of storm-water may be controlled. The volume now impossible of treatment is turned back into the river. While from  $7\frac{1}{2}$  to 8 million gallons of sewage are daily presented from the town sewers, only about half that quantity can be dealt with. The authorities are adopting measures to limit the quantity of liquid matter offered them, and with this object they are endeavouring to arrange that clean water streams shall not enter the sewers at all, and that manufacturers shall provide at their respective mills tanks where matter in suspension may be deposited before the liquid is finally carried away by means of the town sewers. Even then extension of the sewage works will be called for, and it was in this view of the contingency that the Whitehouse Farm, lying at the foot of Dalton Bank, was recently acquired at a cost of £5000. From the valve chamber, where the town's sewage enters the works, the distance between that point and what may be described as the

#### ADMINISTRATIVE BUILDINGS.

is occupied on the right by ornamental gardens, which give a very neat appearance to the enclosure; and on the left by buildings containing what is technically known as the roughing tank or detritus, where the solid matter is dredged from the sewage; and still farther on the same side the refuse-destructors, boilers, and a fine octagon chimney in brick rearing its shaft 90yds. above the surface, and constituting the highest in the district, save the one at Fieldhouse, belonging to the Leeds Fire Clay Company. The set of structures on the left have trees trained up their walls, suggesting rather buildings associated with a fruit-growing establishment than a place of necessity of a slightly more unsavoury description. The buildings generally are of blue brick, relieved by courses in stone, and the administrative section, coming across at right angles, is further relieved by a clock-tower, containing a useful timepiece, which strikes the hours. A couple of boilers are now at work for driving thirteen arc electric lamps of 1000 and 1500 candle power, numerous incandescent lamps, and the sludge presses, which deal with about 1000 tons of matter per month. It is hoped that when got into effective operation the destructors will generate enough steam to keep the electric-lighting plant at work without any demand upon the boilers. From the valve chamber the sewage is culverted to the detritus tank, 125ft. in length, where a dredger made by Messrs. Thos. Broadbent and Sons, engineers, Huddersfield, lifts from the tank fifty tons per week of the more solid matter. This, for the moment, is being removed by neighbouring farmers for tillage purposes. Arrived at the end of the roughing tank, the floating matter, consisting largely of oil and refuse wool, is removed. Manufacturers would do well to utilise both for their own gain, and so secure the removal of articles which are no little source of dirt and trouble at the sewage works. The wool refuse, now amounting to about 6 cwt. per day, at one time totalled four times that quantity, and was reduced through the efforts of a sub-committee, who made such representations to millowners as to bring about the change now recorded. As it is, the works manager is able to boast of an excellent suit of clothes made from such refuse wool, and other portions are being worked up for some such similar purpose. The sewage now ready for treatment passes through a measuring wheel, whose capacity is 3000 gallons per revolution, and is then treated with a precipitant known as ferozone, supplied by the International Water and Sewage Purification Company, London, who also are the

makers of the polarite used in the filter-beds. The sewage coming largely from mills, varies in colour and density almost hourly, and as certain coloured sewage requires the application of double the quantity of the precipitant to other kinds, the apparatus supplying it cannot be worked automatically, but has to be operated by hand, to suit the

#### EXIGENCIES OF THE MOMENT.

The action of the precipitant is easily observable when the process is conducted on a small scale in a testing-glass. The sewage, first seen as dark, even-coloured liquid, having received its due quantity of ferozone, soon begins to break up. The dense matter coagulates, and quickly presents the aspect of a black snow-storm, whose flakes ere long fall to the bottom of the glass. It is whilst these dense particles are in suspension that the sewage passes under the administrative buildings in culverts, and divides right and left, in order to reach the twenty-four settling tanks, a dozen on each side of the system, there laid out to view. From the tanks, where the sludge is deposited it passes inwards to the filter-beds, and after filtration is carried along the length of the system in open troughs or aerating channels, to be delivered again close to the administrative buildings into a stream with a pebbly, concreted bed, and banks of rock work, relieved by flowering shrubs and ferns, whence it leaves the works, and enters, five furlongs farther down, the river, near the weir at Colne Bridge. So pretty is the aspect of the stream that the onlooker would be little more the subject of surprise if gold fish or speckled trout were detected disporting themselves in the bright, clear water. In one of the settling tanks an experiment has been tried for the automatic removal of sludge, and so successful has it been that it must ere long be fitted to the remaining tanks. In the case of the twenty-three other tanks, sludge has at present to be removed by hand; the men, supplied for the purpose with fishermen's brogues and thick woollen jackets, having to descend into the sludge, and pass it out with the aid of suitable implements. The automatic arrangement is the monopoly of the International Company already referred to. The sludge afterwards reaches the press-room by gravitation, and here are four large presses operated by compressed air. By means of the presses about 60 per cent. of the moisture is removed, and the sludge-cake left is afterwards lifted by a hydraulic hoist to a convenient level, and then conveyed to a tip on the estate.

The opening recently took place of the new railway station which has been built in the Ashley Road, Boscombe, by the London and South Western Railway Company, at a cost of some £30,000.

THE Select Vestry of Liverpool has decided, by a majority of one, to give authority to a special committee to obtain a site upon which to erect buildings in order to obtain additional accommodation for the bedridden infirm.

ARRANGEMENTS have been made with the Stepney Estate, Llanelly, for the erection of a large hotel on the site of Bradbury Hall, which is now being demolished. The new hotel will face the Town Hall, and will have a frontage of 230ft.

MR. WALTER GOODMAN has painted a half-length portrait of the Right Hon. Lord Russell of Killowen, G.C.M.G., in pastels, and is exhibiting it at the Japanese Gallery, 28, New Bond Street. Mr. Goodman has portrayed Lord Russell in his robes and chain of office, without, however, investing him with the awe-inspiring wig which pertains to scarlet and ermine, point lace cravat, and golden collar.

MR. JOHN CLARK TAYLOR, a Boston citizen, has agreed to sell his residence and about 15,000ft. of land in Loring Park, Minneapolis, to a Boston syndicate for the sum of £8000. Plans are being drawn for a ten-story apartment house, containing forty flats, with elevators and every modern convenience, which it is proposed to erect upon the land purchased. The improvements will cost nearly a quarter of a million dollars, and the proposed building will be unique in its situation, which is in the midst of a city park of forty acres.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
June 9th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE South Kensington report is not new, but it is urgent. Though the danger of these sheds in which we have housed our priceless treasures has been often talked of, no one, we fancy, has ever before realised it quite so clearly. Neither have we ever before been brought face to face with the position at a time when the nation had so ample a surplus of cash. The danger runs on from day to day, and any day when the sun is hot, and the winds dry, we might lose not merely treasures of enormous money value, but possessions which no money will replace. Do what we will, this risk will go on perforce for months and years before new buildings are complete. Why should not the common-sense of Parliament force Sir M. Hicks Beach to let the plans, which are complete, be put in hand at once?

RIVERSIDE building has now almost reached the stage described as a "boom," and not only in such popular centres as Richmond and Kingston, but in places like Twickenham, Teddington, and Staines. The waterside bungalow acquired sufficient popularity last year to justify later extensions. At Teddington the construction has been carried out somewhat on Venetian lines. Canals have been cut inshore to a considerable distance, and on their margins have sprung up quite architecturally attractive little dwellings. They are a happy medium between the tent and the more pretentious "residence."

THE Royal Palace Hotel extension has now been opened, and those who attended the inaugural reception last week were charmed with the perfect taste and sumptuousness of the decorations. The hotel accommodation, by the addition of the "Empress Rooms," has been increased by almost one-third, and certainly it may be said that the architectural beauty of the building has been augmented to an equal extent. The new suite is reached by a separate entrance, leading into a fine marble pillared hall, and which, in turn, leads into the "Grand Hall"—the feature of the extension. This room, with its cerise-tinted tapestry panels, wainscoting of polished birch and sycamore, and white and gold ceiling, has an extremely elegant appearance, whilst the foyer, which has a very prettily painted ceiling, is ornately decorated and upholstered in pale blue, white and gold. Supper and "crush" rooms, with a large number of bed and sitting rooms, have also been added, and everywhere the decorations are lavish. Messrs. Legge and Son are the Architects, Messrs. Bywater and Sons are the builders. Messrs. Norton and Co. and Messrs. Graham and Banks have executed the internal decorations, and Messrs. Dannison and Co. have extended the electric lighting system, and introduced many new designs in brackets, &c. The light installation in the supper room—the wall panels of which apartment are of beaten lacquer and of a handsome floral design—is carried out on an altogether new principle. The electric lamps are concealed behind the cornice, and whilst giving a

sufficient illumination averts all unpleasant glares, and somehow gives the apartment a cool and restful aspect.

HAVING had the Blackwall Tunnel auspiciously opened, the London County Council passes from the completion of its first great work to the promotion of another Thames subway. A Select Committee of the House of Commons has had under consideration the Council's Bill for the construction of a footway under the river from Greenwich, near the Ship Hotel, to the Isle of Dogs, immediately adjoining the station of the Blackwall Railway. The cost was estimated at £70,500, including lands and property. The scheme would give a roadway 8ft. wide and 9ft. 4in. high for foot passengers. Its two ends would be approached by circular shafts giving accommodation for reaching the level of the tunnel, which would be 40ft. deep at one side and 50ft. at the other. The object of the tunnel is to facilitate the passage of workpeople from the Isle of Dogs, where industrial undertakings are closely crowded together, to Greenwich, where there are very suitable places for residences.

It is admitted by experts that at least 80 per cent. of "antique objects" in existence at the present time have been manufactured within the last dozen years. A practical demonstration of how the thing is done was given before the Bow Street magistrate a few days ago in a dispute respecting the possession of certain "antique" ormolu articles, about which there had been an abortive trial. A firm of dealers claimed them, and two workmen did the same. The latter were particularly assertive in their ownership, saying they ought to know, because, as a matter of fact, they made the articles. To prove their point they set to work and showed, to the amusement of a critical audience, how ormolu was made "antique" by the aid of pumice powder. With respect to most of the articles, Mr. Vaughan decided in favour of the firm, but had so much doubt about an "ancient cabinet" that he ordered it to remain in the hands of the police until the deponents came to amicable terms.

IN the Sydenham Gallery the present collection of pictures is one of the best they have yet brought together. There are close on nine hundred works, oils for the most part, and contributed by both British and foreign Artists. Mr. John H. Bacon takes the Gold Medal in the English Section for a figure subject, "The Idol of the Village," which is pleasant in colour, well-composed, and filled with a warm, soft, well diffused light. Mr. George C. Haité, R.B.A., takes a gold medal with "In the Streets of Dort," an amazingly clever study of the impressionistic kind, not carried further than the stage of complete suggestion. Work very different is the Gold Medal water-colour, "On the Piazza," by Mr. Samuel J. Hodson, R.S.W. Here nothing is left to the imagination, but with delicate and careful brush every detail of the scene is touched in. Silver medals for water-colour go to Mr. G. D. Hiscox, Mr. John Eyre, R.B.A., Mr. Henry Bailey, and Miss Nora Davidson. The best canvas in the Exhibition comes from a foreign Artist, Vincenzo Caprile, to whom the judges had no difficulty in awarding the Foreign Artists' Gold Medal. This work is called "The Easter Lamb Market." The picture is filled with atmosphere, its tones are soft and clear; the work marked by restraint and refinement, both of colour and technique, which places it far before its neighbours. "Strand in Brittany," by E. Spoerer, takes the gold medal for sea-pieces, and there is no reason to quarrel with the choice, for the Artist gives a fine distance to his scene, and renders the quality of atmosphere and light with much cleverness. Silver medals go to Messrs. A. E. Proctor, J. L. Cloag, W. F. Calderon, G. Hilliard Swinstead, Wyke Bayliss, P.R.B.A., L. B. Hunt, H. A. Olivier, and A. O. Townsend for oil paintings of various kinds, and eight silver medals pass to the foreign Artists.

A FREE Loan Exhibition of Pictures was recently opened at the Polytechnic in the

Borough Road. Mr. David Murray, A.R.A., said their best thanks were due to Mr. J. S. Forbes for the pictures from his collection, which comprised three beautiful works by Corot, two by Josef Israels, and three by A. Mauve. Among the other pictures on the walls were Mr. Watt's "Tormentor," "Escaped," and the "Birth of Eve"; Mr. Alma Tadema's "Question," and portrait of Mr. A. J. Balfour; Mr. Wyllie's "Work-a-day England"; Mr. Solomon's "Delilah"; Mrs. H. M. Stanley's "Having it Out"; Miss Bruce's "Edipus and Antigone," and M. Paul Renouard's drawing of the "Corner of the Babies' Class" in a Board school.

THE Select Committee appointed to inquire into the administration and cost of the museums of the Science and Art Department has decided to make an immediate report to the House of Commons on the peril of destruction by fire to which the priceless collections at the South Kensington Museum are exposed. The necessity of providing, in place of the present temporary structures, buildings suitable for the exhibition of the objects of Science and Art collected at South Kensington, has been long under the consideration of successive Governments, and the Committee recommends that the construction of permanent buildings for these collections should be proceeded with without delay.

ONE of the largest and most important finds of papyri in Egypt has been made during the last winter by Mr. Bernard P. Grenfell and Mr. A. S. Hunt, of Queen's College, Oxford, at Behnesa, the ancient Oxyrrhynchus. The site of the old town, which is  $1\frac{1}{4}$  mile long by half a mile broad, and is situated on the little explored edge of the western desert between Fayum and Minya, had remained almost untouched by dealers and antiquity seekers, and offered to the excavators—what is in Upper Egypt now almost a thing of the past—a practically virgin field. Very few remains of buildings were discovered, the place having been long used as a quarry both for stone and bricks, but many of the ancient rubbish mounds yielded a rich store of papyri, while in three mounds the quantity of rolls found together was large enough to warrant the assumption that part of the archives had been thrown there at different periods. The papyri range from the Roman conquest to early Arab times, each century being largely represented, and are for the most part written in Greek, with a sprinkling of Latin, Coptic, and Arabic.

THE proudest feature of the ancient village of Kempsey, on the banks of the Severn, about four miles from Worcester, is its quaint old Parish Church, restored some thirty years ago. In this Church there is a monument built of solid stone and curiously carved, erected to the memory of Sir Edmund Wyld, who died in 1620 at the age of thirty-two. The recumbent figure of the knight lies under a stone canopy, supported by two small fluted pillars. His hands are folded on his breast, with his sword between them, and his helmet is by his side. The inscription above him tells that "he was solemnly here interred with great lamentation," also that he was "thought worthy the honour to be High Sheriff of this county."

M. AUGUSTE FILON is now discussing English painters in the Paris *Debats*. M. Filon has visited the Royal Academy, the New Gallery, and the Grafton Gallery. The conclusion he has come to is that although there are so-called English painters, there is no such thing as an English school of painting. The opinion of M. Filon on this matter is, however, very much discounted by his candid admission that he is not an Art critic, and thus knows nothing about painting. For a real opinion we must go to M. Rochefort, who knows England better than M. Filon; and is what M. Filon on his own admission is not—a capital judge of pictures. M. Rochefort has recently been saying the most amiable things of English painters; and has been commending their work to the earnest attention of French Artists.

UNIVERSITY OF ILLINOIS

THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD, WEDNESDAY, JUNE 9, 1897.

DESIGN FOR AGRICULTURAL COLLEGE. MESSRS. SILCOCK AND REAY, ARCHITECTS.

PORTLEY WOOD, WARLINGHAM THE GARDEN FRONT. W. E. HEWITT, ARCHITECT.

LIBRARY  
OF THE  
UNIVERSITY OF ILLINOIS

THE Bishop of London has just been comparing London, architecturally, with ancient capitals, to the disadvantage of London. Lord Rosebery said, a few days ago, that not even Rome herself, the city of great buildings, could show anything like the Blackwall Tunnel. The Bishop would certainly retort that, considering Rome's inferiority in applied science, her glorious aqueducts, the remains of which still exist, surpass anything the London Architects and engineers have ever achieved. At any rate, it is true that, in a London overtaken by the fate which befel the ancient capitals, only a few buildings would in a thousand years survive in a wilderness of brick-dust. The few relics of Old London still left are passing away. As the old places cannot be preserved, a "Society for the Survey of the Memorials of Greater London" is now, and has been for some time, engaged in compiling an illustrated register of notable buildings and localities. These lovers of London are doing a really good service to their contemporaries and to posterity. What would one not give for a similar register of Athens in the time of Pericles, or of Rome in that of Caesar? Not only are old buildings to be registered and photographed or sketched, remains of open spaces, "any beautiful tree," "any object of local life that may have a definite embodiment, or any interesting piece of handicraft, even if it be but a signboard or a wrought-iron gate," are being treated in the same way. There are left in London some remnants of old village greens, and a good many fine old trees; also one or two of the galleried inns that were still in their glory in the coaching days, and where at an earlier period the strolling actors strutted on the stage of their mimic world. One of these inns, still left in Holborn, is about to be given up to the house-breakers. A little while since there disappeared from Chancery Lane a famous relic of Dickens's London. The Society has been at work in the East End of London. It will shortly begin operations in Chelsea, a parish extremely rich in historical associations.

SOME valuable pictures by old masters have been selling at Robinson and Fisher's during the last few days. The more notable were a brilliant example of Hondekoeter, in the shape of a garden scene, with peacock and peahen, and other fowls, 1270 guineas; a pair of companion views, by Guardi, on the Grand Canal, Venice, sold together for 470 guineas; and a view of the Piazza, St. Marco, Venice, with figures, by the same, realised 250 guineas; a portrait of Cecilia Townley, afterwards Mrs. Strickland, 400 guineas; a perfect example of A. Van der Neer, a twilight scene on a canal or river; a work of the highest excellence, 335 guineas; and a portrait of the Infanta Maria Margarita, youngest daughter of Philip IV., attributed to Velasquez, but obviously an old copy, 215 guineas; a view in Venice, with gondolas, watermill, and sluices, by Caneletto, 600 guineas; a charming rural village scene, with Church, country inn, clusters of trees and figures, by Hobbema, 1900 guineas; a collection of fruit by De Heem, 1696, 265 guineas; a road scene in a forest, by the elder Crome, painted in 1818, 390 guineas; three beautiful little landscapes, by Gainsborough, in his early manner, sold for 125 guineas, 300 guineas, and 255 guineas respectively; an important example of Hondekoeter, two cocks fighting, with other fowls, signed, 2180 guineas; three cows, by Paul Potter, 345 guineas; portraits of Henry, Lord Arundell, Seventh Baron of Wardour, and of his wife Mary, 860 guineas and 1130 guineas respectively; a portrait of J. Everard, Ninth Lord Arundell, by Sir T. Lawrence, 700 guineas; a three-quarter portrait of an Italian noble, by Giorgione, 900 guineas; and a woody landscape by Ruysdael, 350 guineas. The two days' sale realised over £21,000.

At Earl's Court this year the collection of old English dwellings which occupies the site of the Indian village of last year is the representation of an old-fashioned English town, "comprising the most picturesque bits of English Architecture." The old buildings are very well done. There is a most picturesque public-house with the title of the "Eisen Sun,"

whose Architecture is about sixteenth century, but whose rooms include one furnished in the style of 1837, and another in the style of the present day. From the contemplation of these two rooms, observes Mr. Kiralfy ingenuously, we may see that whereas our forefathers were accustomed to an almost classic rigidity in the matter of furniture, foreign travel has made our rooms of to-day far more artistic than those of the past.

It would be interesting to know how the Royal Academy takes the Harpignies incident. The venerable landscape painter is seventy-nine years of age, and has exhibited at the Paris Salon for the last half-century. This year he sent a picture to the Academy, which was rejected. And now the news is published that the Medal of Honour of the Champs Elysées Salon, a distinction which is eagerly sought by even the greatest Continental Artists, has been given to M. Harpignies. Whether this will be taken by the Royal Academy as a polite snub remains to be seen.

THE new Queensferry Bridge, opened on the 2nd inst., is in three spans, with two stone abutments and two intermediate piers, the centre span being moveable. The two fixed spans are each 126ft. long, and the centre span 120ft. The abutments are of Connahs Quay stone, the approaches on each side extending some distance with a gradient of 1 in 16. The Flintshire abutment also carries the engine and toll-keeper's house, a brick building containing engines, boilers, accumulator, and other machinery, as well as a living-room and watch-room. The two piers are formed of clusters of screw piles, protected by wood pile fenders, sunk to a considerable depth into the sand bottom, and filled round with stone rubble to prevent scour. Each pier has 10ft. 6in. diameter solid steel piles, braced together every way, and fitted with Barber's patent mushroom screws. The bearing of the bridge on these piles is equalised by cap girders of steel plate rivetted into one piece. The fixed spans are each 140ft. total length by 25ft. width, having a roadway 18ft. wide and two footways of 3ft. 6in. each. They are supported by steel main girders of lattice form, resting at one end on the abutments and at the other end on the cap girders of the piers. The platform is constructed of steel corrugated flooring plates, or "trough decking," filled with concrete, asphalted and paved with wood bricks, with a cast-iron fascia and parapet. An elevated room is provided with windows facing up and down and across the river, and in this room is fixed the hydraulic starting valve controlling the movements of the bridge.

MR. MENDOZA has brought together a fair little exhibition of pictures, not immediately recent, by Artists of repute, including living Academicians and Associates. Mr. Frith is not often seen nowadays in so well concentrated a scene and in such harmonised colour as in the small canvas repainted in 1882, "The Squire Teaching his Sons to Box;" and a picture of popular interest, from the same Artist, is of the critical moment when Albert Edward placed the marriage ring on Alexandra, Princess of Wales. This was painted at the time of the wedding—1863. While Frank Holl was at the period of devoting himself to lugubrious subjects, he painted the touching picture, "The Burial of the First-born," but without that morbidity of tone which renders some such themes of his depressing. Quite an early picture by Mr. T. Faed, "The Thorn in the Foot"—it is half a century old and in first-rate condition—shows all that Dutch-like devotion to details of humble homes, and that ability to depict facial expression, which he developed so well in later life. There is a large coast piece, with excellently painted sky, by Mr. Peter Graham; two landscapes, of Mr. Leader's usual class and standard; a scene from "Tom Jones," by Sir John Gilbert; sporting scenes, by Mr. Heywood Hardy; a historical scene, "Cromwell at Bootham Bar, York," full of movement and of good execution, by Mr. Ernest Crofts; and paintings by Mr. Briton Riviere, Mr. Dendy Sadler, Mr.

S. E. Waller, or such elder masters as Shayer and Stark.

THE Committee which was appointed some time ago to raise subscriptions for the purpose of placing a portrait of Viscount Peel, the ex-Speaker, by the side of his predecessors in Speaker's House, has issued its final instructions to Mr. Orchardson, the artist. The late Speaker will be represented in his full-dress Speaker's robes, but the question as to whether he will be sitting or standing has been left undecided for the present. The Committee is somewhat inclined to favour a sitting posture, although each of the ex-Speaker's predecessors in office—Viscounts Eversley, Ossington, and Hampden—are represented in a standing position.

"A FEW months back, when walking through the squares or courts of Gray's Inn," says Mr. H. W. Brewer in one of his periodical letters in the Daily Graphic, "there was little to recall the fact to one's mind that any of the surroundings dated from the Middle Ages; least of all did the hall and chapel suggest ideas of antiquity, for they had been so completely coated over with modern plaster work and other Brummagem features that they seemed to be samples of the 'Strawberry Hill' Gothic style, and no one who had not seen the fine interior of the hall would have supposed it to date back earlier than the end of the eighteenth century. The removal of the plaster work and exposure of the old red brick walls and stone dressings now take us back to the days of the later Tudor sovereigns. It is, in fact, said that the hall was commenced in the reign of Queen Mary, and completed in the second year of the reign of Elizabeth. This date would certainly suit well, for other painters must have labelled her sadly. Unfortunately, the painter's name is unknown, but there is an Italian look about it, and one may hazard the guess that he was a Venetian from the richness and softness of the flesh tints. Anyhow, it is a most interesting portrait, and deserves more notice than it has hitherto received." It should be added that the restorations to the Hall, Council Chamber, &c., at Gray's Inn, have been carried out from designs, and under the direction of Mr. H. Isaacs.

"THE safety of Britain's art treasures in the National Gallery, Trafalgar Square," a correspondent writes, "I would submit, is a matter of national importance. A huge scaffolding of resinous wood, amounting to several tons, is now stacked close up against its front, in much the same way as laid in a grate, and immediately in rear are glass windows, communicating directly with the interior of the building. The risk of fire under these conditions is a very real one, and is to continue for a month. With twenty years' practical experience of fire brigade work, I do not hesitate to say that, given ignition in a fairly high wind, the National Gallery stands a very good chance of being totally destroyed. On the occasion of a large fire engines leave the district, and on Jubilee Day help may be rendered impossible."

DOWNING STREET evokes a host of memories. When, therefore, it is proposed to demolish the official residence of the First Lord of the Treasury and to substitute offices, adjoining the Treasury buildings, the first feeling, says the Telegraph, undoubtedly is that a number of historical associations, which, if they are not intrinsically valuable, are at all events politically interesting, would be, by such a project, somewhat ruthlessly swept away. Everyone knows that the Government Offices in Whitehall and the neighbourhood are to be extensively reformed, and that the approaches to the noble Palace of Westminster are to be made worthy both of the centre of political life enshrined at St. Stephen's, and also of the national business concentrated within this narrow, and not wholly convenient, section of the Metropolis. We may concede the necessity, even if all the details which are involved may not be wholly acceptable. The Admiralty and the War Office ought to be contiguous,

for reasons alike obvious and important; and there may be something in the appearance of Downing Street—that fascinating *cul-de-sac*, as Theodore Hook described it, an hour's inhalation of whose atmosphere "affects some men with giddiness, others with blindness, and very frequently with the most oblivious boastfulness"—which, to the artistic eye, does not consort altogether with its surroundings.

NEVERTHELESS, whatever may be the architectural shortcomings of this official home of our past historic life, there are many, we may be assured, who will view its disappearance with regret, and consent with some uneasiness to the practical expediency which ordains its rehabilitation. According to the evidence given by Mr. Shaw-Lefevre before the Committee on Government Offices, there is a good deal which a modern *Ædile* ought to recommend in order to beautify and improve Whitehall and its immediate entourage. There is one proposal above all which is interesting and valuable. Why, it is asked, should not the Prime Minister have an official residence adequate to his requirements? Is it not possible to utilise Dover House—the building which was long ago tenanted by the Duke of York, and which everyone recognises, with its low dome over the entrance-way, close by the Horse Guards—as a home for the First Lord of the Treasury, while his present residence in Downing Street might be transformed into public offices? This, at least, is the picturesque suggestion of a former First Commissioner of Works, which, because of its patent and explicit advantages, seems to deserve careful consideration. Dover House is not an ideal building for business purposes, but its large reception rooms would be extremely convenient from the point of view of a hospitable Prime Minister, aware of the social responsibilities of his position.

THE rooms of the Alpine Club in Savile Row are occupied at present by a large number of oil and water-colour studies by Mr. Albert Gos, Mr. Loppé, Mr. Henry Howard, Mr. H. C. Whaite, and others, representing mountain and glacier scenery, chiefly in Switzerland. Mr. Loppé contributes a striking study of a lurid sunset seen from the Grands Mulets. "Glen Slighachan" is the subject of an exquisite bit of work quite Turnerian in suggestion and full of variety, and entered by Mr. H. C. Whaite. The largest and perhaps most important picture is "Moonlight on the Matterhorn," by Mr. A. Gos. This work attracts much attention, but it is certainly deficient in atmosphere, and the moonlight effect, perhaps owing to an over-literalness in colour and detail, is not very obvious. The strongest picture in the rooms is Mr. Molineux's "Dawn on the Himalayas," representing high mountain regions glittering in frozen snow, with a smoky dawn behind. A glacier study by Mr. Loppé, in which the translucent ice-blocks are cleverly managed, deserves special mention. Many of the pictures are crude and unstudied. For example, the "Gorge of Boita," by Mr. Howard, is spoilt by the heavy inkiness of the foreground.

It is always a pleasure to go to the exhibitions arranged by the Burlington Fine Arts Club. The little gallery upstairs is now filled with a really very wonderful loan collection of European enamels "from the earliest date to the end of the seventeenth century." The most important methods, the most celebrated artists are represented; many of the pieces shown are of world-wide fame; and an excellent catalogue has been prepared, containing a description of each example as well as introductions, that set forth the main historical and technical facts, by Mr. J. Starkie Gardner and Mr. Alfred Higgins. With enamels, as with stained glass, the great beauty is colour; every case, every article in it, is a harmony to delight the eye. And we think this was a beauty understood by the most primitive as well as the most accomplished craftsman. Indeed, with time, the

enameller perfected his medium to such an extent that he could give a delicacy of drawing and modelling undreamt of by earlier Artists, sometimes with a freedom that carried him almost beyond the legitimate limits of his Art. The workers may have been "humble artisans," executing their tasks with all speed and economy, but the blues and greens of their reliquaries and pyxes and crosses and missal covers have never been surpassed in richness. The comparatively coarse work you get in the English *champlevé* of the seventeenth century—in the andirons and candlesticks of Case XV.—appropriate enough as it is in Design, has much the same charm of colour. But for the refinements of the enameller's Art you must turn rather to the Pénicauds, to Léonard Limousin, to the Courteys family, to the masters, that is, of the sixteenth and seventeenth centuries, who are here seen to advantage.

THE "Old Bell" in Holborn is to be demolished. The Christ Hospital authorities have advertised the ground for sale on building lease. With it will pass away one of the few remaining old London inns with galleried courts. For very many years a vehicle left the old inn every day for the heart of Bucks, John Hampden's country. But the Metropolitan Railway extension has killed that. Each year steals something picturesque from us of fast-waning historic London.

STEPS are being taken to approach Her Majesty's Government with the object of securing their aid in the carrying out of the project for constructing a tunnel between Ireland and Scotland. It is estimated that the cost would amount to between seven and ten million sterling, and it is confidently assumed that with a Government guarantee of a small rate of interest the capital would be speedily forthcoming. The idea has been taken up (or rather revived, for it was first seriously broached some years ago) in Belfast and the North of Ireland, where a local committee has been formed to promote it. A London Committee is also in course of formation for the same purpose.

LAST week Messrs. Christie conducted the sale of the well-known collection of pictures formed by the late Sir John Pender. The Pender collection included no fewer than 437 lots, and was of a very varied character. The Sir Joshua's are not all that they should be; and a number of portraits in the further room are only interesting as illustrating the form of ancestor-worship which is practised by some collectors. When we come to the Turners, it is a different thing altogether, and besides four fine works of that master, there is the finest John Phillip in the world, an excellent Wilkie, capital works by Callcott and Collins, a good Müller, and a fine Troyon. The central place is occupied by the famous "Mercury and Hersé," a large upright picture, belonging to Turner's "Claude" period, and first exhibited in 1811. "Mercury and Hersé" is a type of Turner that hardly ever comes into the market, and is comparable rather with the "Crossing the Brook" in the National Gallery than with any picture that has been sold of recent years. Much later is the very fine picture "The Wreckers," exhibited in 1834, and sold in the first Bicknell sale, in 1863, for 1800 guineas. The John Phillip, "La Gloria," is not only the masterpiece of the painter, but one of the greatest works of the English school, which assuredly must, now or at some future day, find its way to the national collection. Here, too, are to be found the celebrated "Prescribed Royalist" of Millais, and another early work, "The Enemy Sowing Tares"—a portrait, the story goes, of a painter of whom the young Millais disapproved. Mr. Leader's "At Evening Time it shall be Light" is one of the most popular of the more recent works in the collection.

BEFORE the Royal Society of Literature, at its rooms in Hanover Square, Professor W. M. Flinders Petrie gave a lecture on "Egypt and

Early Europe," in which he sketched out some of the evidence for connection between the two in very early times. The Master of St. John's College, Cambridge, presided. Beginning with the alien race whose presence in Egypt about 3000 B.C. was discovered a few years ago, he showed that pottery had been found in Spain and Bosnia, and also at Hissarlik, similar to that found in their tombs, and concluded from that and other evidence that this race was, as it were, a slice of European civilisation transferred to Egypt and dating from the latest neolithic age. Heshowed again that rude figures in various materials, possessing certain anatomical characteristics, which he roughly referred to Bushmen, were successively found in the south of France, Malta, and Egypt, indicating the southward recession of this people. Coming to about 2500 B.C., he exhibited pictures of seal-stones from Crete bearing ornamentation almost identical with that of Egyptian scarabs of the twelfth dynasty, and then proceeded to discuss the connection of Egypt and Greece in the Mycenaean age, which he said was now less dim to us than the condition of England after the Roman evacuation. He pointed out how the ornamentation of Egyptian objects, which belonged to 1500-1200 B.C., and the date of which could be made out with certainty, was copied, often unintelligibly, in Mycenaean remains. He also described various articles found in Egypt that embodied the characteristics of Greek Art of that period.

MESSRS. ADAMS AND Co.'s latest catalogue of their specialities should claim the attention of all sanitarians. In almost every department there is something specially interesting in the way of new Design. But in no department have Messrs. Adams and Co. shown such enterprise—at once inventive and artistic—as in that of latrines and closets. Here we have something entirely new. Their patent glazed ware slab closet, the "Epic," represents a new departure in the Design and manufacture of domestic sanitary appliances. The illustrations show that in one solid piece of highly-glazed earthenware, the closet-pan itself, with slab top, back skirting, flush-pipe, and closet outgo are all formed, and that on the same slab lugs for supporting the closet in the wall are provided. Next, is illustrated Adams's patent "Helios" valve pedestal closet, which is claimed to be the most perfect valve closet extant. Dispensing entirely with all wood casing, and the lead tray which have hitherto been inseparable from the valve closet, this apparatus combines in one piece of highly glazed earthenware the closet pan and valve in pedestal form. The "Lumina" Syphonic Closet is made in a slab of glazed ware, as the "Epic," and has a syphonic discharge readily set up by a two-gallon flush. Turning to lavatory ranges, the "Helios" commands a high position. It has ample strength without excessive weight, has an adequate self-contained overflow, and has many other improvements. In one pattern the basins are entirely supported above ground by glazed ware brackets. The valveless lavatory range is supplied with a continuous stream of water (so long as the stop-cock is turned on), the consumption of water being very materially reduced by the introduction of a special patent intermittent regulating valve. Adams' anti-syphonic trap, which obviates the necessity of a vent-pipe, and gives a permanent seal when applied to a lavatory basin, sink, urinal, or any general purpose, has special merits deserving of attention. whilst the design and construction of a number of glazed ware urinals—the "Helios," the "Insular," and the "Cresset" in particular—are worth more than passing notice. Messrs. Adams and Company manufacture special public baths and wash-house appliances; and an illustration of a combined sink and lavatory should be noted. The "Helios" water-pipe is claimed to be able, practically, to defy the severest frost; and especial value in the automatic flushing of house drains, &c., is claimed for their glazed ware syphon flusher. The patent Opaline for wall-linings, casings dado facings, panels, &c., is very decorative in appearance, and at the same time durable.

## Men Who Make.

### A VISIT TO THE BURMANTOFTS WORKS, LEEDS.

BY OUR SPECIAL CORRESPONDENT.

THE passer-by in suburban streets often enough notices a welcome splash of bright colour in the window of a house. Sometimes it is a deep rich yellow, or a radiant red; or, maybe, a full celestial blue. But, anyhow, it is bright and cheerful, affording a refreshing change from the brick and mortar monotony.

THE BURMANTOFTS WORKS, LEEDS. MAKING MODELS AND MOULDS.

Whence comes it? Well, in one sense, speaking philosophically, from the growth of a certain amount of crude artistic craving for pure colour; but to lay aside philosophy and speak practically, it probably comes from Leeds.

One is accustomed to associate almost any idea with Leeds, saving only the artistic one. But that is superficial judgment. Beneath the unbending utilitarianism of the northern character there exists a genuine artistic sense, and so, even in Leeds, if the visitor will but direct his steps towards Burmantofts he will find the place of origin, not only of the already suggested vases and ornate flower-pots, but many another work of beauty and brightness.

The other day I was favoured with a special escort over the Burmantofts works, and certainly Mr. Holroyd, the courteous managing director, has many things to be proud of, and that he may well ask the visitor to very carefully note.

Point one, and a by no means unimportant one either, is that here is found on the spot the clay of which the goods are actually composed. A seventy-yards shaft, out of which seem continually to be coming some very dirty-looking little trucks, is the outward and visible sign of subterranean excavations, extending for about a mile. I did not ask leave to investigate this part of the concern, but was content to be shown the grinding-up of the clay, and in one case was all but tempted to taste a handful, for the mixture, coloured as it was for terra-cotta, was for all the world like chocolate in one stage of its manufacture. Mr. Holroyd, however, gently restrained me from the gastronomic experiment, and we passed on to a room where models for the terra-cotta were being prepared in plaster-of-Paris—a material in great demand at Burmantofts, where two tons a day are used.

One or two drying-rooms were shown to me, and of one in particular I have the liveliest recollection. Personally, I claim for myself a highly sympathetic nature, but I am convinced

that the room in question would shrivel me up in no time, and I should become as dry as Euclid, or a treatise upon the differential calculus.

A most interesting process was traced in the making of glazed bricks. One man, whose deftness I noticed, makes, I was told, 3000 a day, and it did one good to observe the dexterity with which he flung the dab of clay into the mould and completed the operation. The output of glazed bricks alone here is over 100,000 a week.

In another large and airy shed the "dipping" or actual glazing of the otherwise completed brick was in progress, and from here the next

After watching the various stages in manufacture, it comes upon one as a sort of charmed surprise to be shown into a room where the finished articles are arranged and set forth in order and grouping. So skilfully is the show-room set out that the bright colours are in no sense obtrusive, but all tone together, and leave upon the mind a sense of colour, it is true, but a no less clear and definite sense of harmony as well, to say nothing of the endless variety of form produced by the skilled workmen and Artists who comprise the staff at the works.

### BIRMINGHAM IMPROVEMENTS.

A REPORT of the Public Works Committee of the Birmingham Corporation contains recommendations in relation to a variety of street and other improvements in the city. As the result of negotiations with the Great Western Railway Company, the latter has agreed to remove the columns supporting the disused viaduct in Great Barr Street and Montague Street, subject to its right to re-erect them in their present position if hereafter it should require to do so. In connection with the completion of the new General Hospital the Committee has authorised the paving of Loveday Street between Steelhouse Lane and Weaman Row and of Steelhouse Lane in front of the hospital with wood, at an estimated cost of £2300. As the new Meat Market is approaching completion, the Committee considers it desirable that the improvement to the foot and carriage ways in Bradford Street, Sherlock Street East, and Cheapside, arranged with the Markets and Fairs Committee, should be carried out. The estimated cost of the work is £750. Couchman Road, Saltley, having recently been widened and sewered, it has become necessary to have the foot and carriage ways completed, the cost of which is estimated by the city surveyor at £750. The sums above mentioned amount together to £3800. Owing to the

### EXTENSION OF BUILDING OPERATIONS

in Washwood Heath Road, it has been found necessary to extend the sewer from St. Margaret's Church along a portion of Church Lane and Washwood Heath Road, to a point about 320 yards east of The Grange. The cost of constructing a 12in. diameter pipe sewer along this length is estimated at about £2300. The attention of the City Surveyor having been called to the necessity for relieving the

THE BURMANTOFTS WORKS, LEEDS. FITTING TERRA COTTA AND FAIENCE.

shade of colour, occupy a large amount of space, and receive a full share of care and attention.

sewer in Bordesley Green Road of the water which finds its way into the sewer in times of storm, he has recommended the construction of

a surface-water drain from the present surface-water culvert in Arden Road along Bordesley Green Road as far as the railway, the cost of which he estimates at £360. The erection of a large factory adjoining the bridge in Spring Hill, over the old line of canal, rendered it advisable that the bridge should be set back. The Birmingham Canal Company is willing to allow the Corporation to make the necessary alteration, and it will maintain the widened portion of the bridge, in addition to the original structure, in perpetuity for the sum of £100. The City Surveyor estimates the cost of widening the bridge at £100, and the committee recommends that it be authorised to

#### SANITARY SCIENCE OF THE VICTORIAN ERA.

NOT the least important section of the Imperial Victorian Exhibition, now being held at the Crystal Palace, is that devoted to sanitary science. Its size is certainly not very great, yet there is much which marks the onward march of sanitation during the period of the Queen's reign. There are not, however, many exhibits which can lay claim to novelty, and indeed many of the stalls were met with at the recent Building Trades Exhibition. Some useful sanitary appliances are shown by The Loco Drainage Company, Limited, whose

former Company gives prominence to its "Granitic Stoneware," whilst Messrs. Broad principally show their impermeable channels, bends, dished gulleys, &c. Messrs. McNeill and Company have a stand for the display of their well-known asphalt roofing material, a model being shown demonstrating its application, and also a second model showing the application of their slag wool for fireproofing and sound-deadening floors. There is a small structure built of the well-known Opalite, by Messrs. William Griffiths and Co., of Bishopsgate Street Within—the sanitary claims of which we need not emphasise—and near this structure the patent system of the Magnetite Sewage and Water Purification Company, Limited, of Manchester, is explained. The principal of the system is to treat the sewage with aeolite before it enters the precipitation tanks. The Asbestos Company, Limited, has two stands. On the first the material is shown in its crude state, and on the second it is shown as a covering for boilers, &c. The N.A.P. Windows comprise a notable stand, and the application of the Company's patent fittings, which can be attached to the ordinary window, is prominently shown. The Company also has on exhibition its patent roller blinds, which greatly facilitate cleaning operations and the like. The N.A.P. Passable Cheeks have special advantages, in that they allow the fanlight to be opened inwards for cleaning, whilst, at the same time, the cheeks are glazed so as to entirely prevent draughts. Facing the N.A.P. Stand is that of Messrs. H. and F. Bonten, Elder Street, Commercial Street. They exhibit a collection of wrought-iron mouldings, both plain and architectural, and in the same part of the building there are numerous stands devoted to the display of gas stoves, &c. We must not forget to mention Couzens' patent gully traps, though it is not necessary to emphasize their efficiency—nor the stand close by which is given over to sanitary wares by Messrs. J. H. Sanky and Sons, of Essex Wharf, Canning Town, whose deep intercepting gullies and traps, and improved channel and kerb combined are their chief exhibits. A display of up-to-date washstands and lavatory appliances is made by Messrs. J. Mitchell and Co., and some pretty designs in hand basins are shown by Messrs. Shanks and Co., of Cannon Street. Messrs. Ewart's stand is entirely given up to various examples of their "Lightning" Geyser.

THE BURMANTOFTS WORKS, LEEDS. MODELLING.

have the work carried out. The committee also report that it is in negotiation with the Gillot trustees with reference to the provision of communication between Reservoir Road and Stirling Road, which they are of opinion would be of considerable convenience to the public. The Public Works Committee also presents its report upon the improvement of the River Rea, the widening of Edgbaston Road, and the continuation of Lower Edwardes Street. The necessity for the straightening and widening of the River Rea between Calthorpe Park and the City boundary has been before the committee for many years, and the work was commenced some time ago by forming a new course alongside Cannon Hill Park. At present, owing to the extremely tortuous course of the river in that neighbourhood, the lands abutting upon its banks are subject to flooding, and the

#### DEVELOPMENT OF THE LAND

for building purposes renders it necessary that the improvement be carried out at an early date, as otherwise its cost must be very seriously enhanced. It is proposed to commence the improvement at the point where the suggested continuation of Edwardes Street would cross the Rea. It is necessary to provide for storm overflows from the main sewer in Pershore Road, which in time of a heavy rainfall becomes surcharged. For this purpose an overflow will be provided at the point where it crosses beneath the Bournbrook and again at Edgbaston Road. The storm overflow in Edgbaston Road can also be utilised for dealing with the surface drainage in that road and other roads in the immediate vicinity, and the cost has been dealt with as part of the improvement. The cost of these works is estimated at £9000. As regards the extension of Lower Edwardes Street to join Edward Road, it is proposed to construct a bridge over the Rea fourteen yards in width at a cost of £1200. The bridge over the river by Cannon Hill Park would be removed, and a new bridge 48ft. in width constructed.

compulsory self-cleansing overflow pipe and rapid outlets have been found so efficient in preventing the insanitary condition in which the ordinary baths, sinks, &c., are often found.

THE BURMANTOFTS WORKS, LEEDS. IN THE STUDIO.

A rather extensive display of sanitary stoneware in various forms is made by The Albion Clay Company, Limited, and by Messrs. Broad and Company, Limited, Paddington, W. The

There are other exhibits—to which pressure of space precludes detailed reference—which considerably enhance the interest of a visit to the sanitary section of the Exhibition.

## Professional Items.

**ABERDEEN.**—New premises are to be erected in Union Street, on the west side of St. Catherine's Wynd, Aberdeen, for Messrs. Sangster and Henderson, drapers. The structure does not harmonise with the general architectural features of Union Street. The block will be five stories high, and will have a frontage on three sides—Union Street, St. Catherine's Wynd, and Netherkirkgate—but the main entrance will be from Union Street. The ground floor is arranged as shop and premises, and six suites of offices will be on the first floor, with frontage to Union Street and St. Catherine's Wynd, while the remainder of the flat facing Netherkirkgate will be occupied for fitting-rooms and saloons. The building was designed by Mr. R. G. Wilson, Architect, and the contractors are:—Masons, Messrs. Pringle and Slessor; carpenters, Messrs. Watt and Clark; slater, Mr. James Wilson; plasterer, Mr. George Gibb; painter and glazier work, Messrs. J. Garvie and Sons; ironwork, Messrs. McKinnon and Co.

**BIRMINGHAM.**—The Baths and Parks Committee has now completed its report upon the proposed construction of a Rotten Row along the boundary of Cannon Hill Park. The City Surveyor has prepared an estimate of the cost of carrying out the various works. The proposed Rotten Row would have a length of 754 yards and a width of 75ft., 40ft. being laid out as a sand-track for riding purposes, with a footpath 12ft. in width, the remaining portion being laid out in grass and shrubberies; the whole area consisting of 18,850 square yards of land. It would be necessary to construct a bridge over the Rea, connecting the Rotten Row with Cannon Hill Park, and the Row would be fenced with unclimbable iron fencing. Suitable entrance gates would be required at the entrance to the Row in Edgbaston Road. The estimate of the City Surveyor for carrying out the whole of these works amounts to £3500. The committee recommends that it be authorised to proceed with the construction of the Rotten Row and bridge, at the estimated cost of £3500, and that the Finance Committee be authorised and instructed to borrow that sum.

**BLYTH.**—In addition to the widening of the river, the deepening and widening of the channel, the construction of a huge import dock; the provision of additional mooring accommodation; and the extensions at the higher reaches near the Factory Point, and the High Pans, the Blyth Harbour Commissioners are about to lengthen the present piers. The east pier is to be lengthened by about 80ft. Another important work which will be of considerable local advantage is the formation of a new dock by the Blyth Dry Dock Company, Limited. This dock will be 480ft. long, with a 61ft. entrance, and a depth of water on the sill of 22ft. 6in. at spring tides. When completed, as it is expected to be in the course of about three months, the dock will be one of the largest along the North-East Coast.

**BRADFELD.**—Bradfield Parish Church has recently been enriched by the filling in of the only remaining plain window with stained-glass. All the windows are now completely restored, and the glass with which they are filled may be certainly regarded as worthily ranking among the best work of modern Artists. The new window is from the studio of Messrs. Joseph Bell and Sons, 12, College Green, Bristol. It is of the Perpendicular style of Architecture, and consists of three lights. The panels are formed by canopy work characteristic of the stonework; in the base are introduced angels bearing scrolls. The abutments are treated in a similar manner, and are filled with angels bearing musical instruments, and shields with the monogram of the Holy Name.

**CARDIFF.**—The plans of the new buildings for the Girls' Intermediate School in the Parade, Cardiff, have been approved by the

Charity Commissioners, and tenders for the execution of the work are now being invited by the Governors. During the past two years the demand for accommodation has so increased, that for some time the premises now occupied have been quite inadequate. The accommodation of the existing buildings, which include a house recently purchased, and two houses adjacent, purchased subsequently by the committee, provides for 183 children, while the proposed new buildings will accommodate an additional 252. The new buildings will be erected partly on the site previously acquired, and on land now occupied by two villas, which are at present used as temporary schools. The new schools will have on the ground floor an assembly hall 67ft. long by 35ft. wide, which will be centrally placed between the existing and the new schools, and on the ground floor will also be four classrooms, teacher's rooms, waiting-rooms, and lobby. On the first floor will be four classrooms and music-rooms, and an approach to the gallery of the central hall. On the second floor will be placed the cookery kitchen and lecture theatre, drawing, class-room, and a room reserved for a museum or library. The accommodation in the basement includes rooms for hats and cloaks, a dining-hall for the use of girls living at a distance, and a gymnasium. The main elevation towards the Parade is to be

—with marble columns and moulded spandrels. The first floor is carried on girders and stanchions from Messrs. Dorman and Long's, of Middlesbrough, encased in wood—excepting four ornamental stanchions in the centre of the frontage—and a bold bracketed cornice above. Stone has been freely used for bands, coigns, arches, panels, and columns. Red bricks for facings have been obtained from the Heaths Company at Leicester, and buff bricks for the bands from Huddersfield. There is a considerable amount of carving done to the stone in the spandrels and cornices, executed by Mr. Paley, of Leeds, from full-sized cartoons supplied by the Architects. Owing to the nature of the stone the carving had to be treated in a very free manner. The wrought-iron work has been executed by Messrs. Hockley Bros., of Doncaster. Messrs. Harold Arnold and Sons, of Doncaster, were the contractors, and the contract was £10,400. The building and land cost £15,000, and the total cost, including fittings, is £18,000.

**DRIFFIELD.**—The new police-court, station, and officials' residence, erected by the County Council on Wansford Road, Driffield, on a site purchased from Lady Downe, are nearly completed, and will be handed over to the authorities very shortly. The elevation of the main building is in the Tudor style, and has

THE BURMANTOFTS WORKS, LEEDS. BRICK DIPPING AND BRUSHING.

erected in Portland stone, and the back portions of the building are to be of red pressed brick.

**DONCASTER.**—The new and extensive premises erected by the Co-operative Society in Station Road were opened a few days ago. The building is a very imposing one. Messrs. Athron and Beck are the Architects, and they based their designs upon a building near Antwerp belonging to the old Dutch adventurers. The main gable is practically a copy of a gable in the Dutch building. The style may be described as Dutch Renaissance. The building in Holland is now pulled down, but sketches of it were taken fifteen years before by Mr. Beck. The new building stands on an area of 1265 square yards, and has a frontage of no less than 210ft. The front is broken up into three main divisions with gables, a tower at the West Laith Gate extremity, and a bold ventilating turret on the ridge of the central gable. The main gable is 80ft. high, and the tower rises to a height of 90ft. Owing to the large size of the rooms and the desirability of obtaining as much light as possible, the Architects adopted in the superstructure a series of small arched windows—instead of big windows with girders often put into business premises

an imposing appearance. The Architect is Mr. A. Beaumont, surveyor to the East Riding County Council.

**DUNDEE.**—The Gas Committee of Dundee Town Council recommends the following tenders for acceptance: For engine and dynamos, Siemens Brothers, London, £1505; boiler, Cooper and Greig, Dundee, £493; and arc lamps and accessories, Crompton and Company, London, £332 4s. It was resolved to recommend the purchase of two new batteries, the contractor taking the old plant. On that footing the offer of the Electrical Power Storage Company, Limited, London, amounting to £1112, was accepted. A large number of designs were submitted for street arc lamps.

**ECCLESFIELD.**—It has been decided to erect a new Wesleyan Chapel on a site which has been secured adjoining the old chapel, to accommodate 650 worshippers. The total cost is some £3000, and about £1500 has been raised.

**EDWALTON.**—New choir stalls have been fitted in the Parish Church, Edwalton. The stalls are beautifully carved in English oak

by Mr. Stocks, from designs by Messrs. Brewill and Baily, in harmony with the screen. They consist of two clergy stalls, with two benches on either side for the choir.

**EXETER.**—The Allan steamship Assyrian, now on its way to Newfoundland, has a large consignment of carved Devonshire oak from the studios of Messrs. Harry Hems and Sons, of Exeter, designed for the choir of St. John's Cathedral on that island, the fabric of which is now being rebuilt after total destruction by fire a few years ago. The work of making the choir fittings is being executed in Exeter by sections, and the present consignment consists, in the main, of clergy seats and desks. They are, like the building itself, in the fourteenth-century style of Gothic Art, designed by Messrs. G. G. and J. O. Scott.

**FLECKNEY.**—Plans for a new chapel have been submitted by Mr. George Starkey, of Leicester, the chapel itself being estimated to seat, with the galleries, 250, whilst provision in the upper and lower schoolrooms is made for 200 scholars. The estimate cost of the whole is £700, the builder being Mr. B. Gamble, of Fleckney. The building, which will take the place of the old one—erected in 1813—will consist of red Warwick bricks, with Derbyshire stone dressings, and it is, moreover, contemplated to considerably improve the approach.

**GATEACRE.**—The opening of new Sunday school buildings belonging to the Unitarian body took place a few days ago. The school has been built from the designs of Messrs. F. and G. Holme, Architects, Liverpool, the sole contractor being Mr. G. Dale, of Gateacre. The building is of brick, with stone finishings, in keeping with the old chapel, and is of a thoroughly substantial character. Internally there is a fine opened timbered roof. The building contains three principal rooms. The total cost of the building has been about £1650.

**GLENCARSE, N.B.**—A handsome rood-screen of carved wood has been erected in All Saints' Episcopal Church. The style of Architecture chosen is Gothic early thin pointed, the same as that of the Church. In the centre of the screen are gates leading into the chancel, with a cusped archway springing from small pillars, richly carved crocketed hoodmould, and surmounted by a handsome cross springing from the apex of the hoodmould and the centre of the rood-beam. The sides of the screen consist each of two arches, supporting pillars, with cuspings and hoodmoulds similar to those of the central arch. These sides rests upon an existing dado of stone, and have quatrefoil panels in the lower portion. The five arches and pillars support a handsome battlemented rood-beam with a deeply hollowed cornice and richly-carved patera. The screen was designed by the Rev. E. Sugden, of Coupar Angus, who has also designed the reredos in the Church, St. John's Hall and Church, Dundee, and several other works. The joiners were Messrs. How, Calderum Street, Dundee, and the carver, Mr. Beattie.

**HULL.**—Mr. J. T. Firbank, of East Hull, has offered to give an iron Church, completely furnished, to seat 400 people, as a commemoration in East Hull of the Diamond Jubilee. Arrangements will forthwith be made for the erection of this building, on the site recently selected, at a cost of £600. The iron Church will be used temporarily until the permanent Church, towards which the Archbishop of York has given £1500 from the Marriott Bequest Fund, is completed.

**NOTTINGHAM.**—In regard to the new M., S., and L. line to London, the work of excavation is progressing vigorously so far as the central station is concerned. Steam navvies are at work day and night, and the area, which a few months' ago was covered with dwelling-houses, is now a vast open space. The communication between Milton Street and Beck Street, through Parliament Street, has been improved. Nothing now remains of the old Ragged School save the remnants of the underground compart-

ments, and Newcastle Street is fast becoming a relic of the past. With regard to the construction of the line outside Nottingham, the erection of signal boxes and semaphores in the neighbourhood of Hucknall and Annesley is being steadily proceeded with, and much of the permanent way has been completed. The connection between the Great Northern and the M., S., and L. from the Eastercroft to Week-day Cross has been nearly completed.

**OMAGH, IRELAND.**—The new Presbyterian Church, which has been in course of erection for the last eighteen months, has now been opened. The building is an example of the English Gothic style. It is built of local blue stone, rock-faced, and the dressings, mouldings, and carvings are of finely-chiselled red sandstone from Dumfries. The roof, which rises to a height of 41ft., is covered with Bangor slates. The two main aisles are 64ft. by 41ft. In addition there are two spacious transepts, 23ft. 6in. broad, and across these are the side walls of the nave, carried by four stone arches, supported on moulded sandstone columns. One of the principal features of the internal arrangements is the cantilever method adopted by the Architect for the roof, which is carried on a single span of 41ft. The constructional timbers of the roof are open and exposed to view. The walls are sheeted to a height of 4ft. with tongued and grooved pitch-pine sheeting. The seating capacity is arranged for 440 on the ground floor, and in addition there is a gallery facing the pulpit, approached by a staircase close to the main entrance hall, which accommodates about fifty. The lecture hall possesses a fine open timber roof, and is well lighted and ventilated. The building was carried out by Mr. Joseph Colbourn, Londonderry; the internal plumbing work by Messrs. James Loudon and Co., Belfast; the heating apparatus supplied by Messrs. Musgrave and Co., Limited, Belfast; and the stained-glass windows by Messrs. Carlisle and Wilson, Belfast. Mr. Charles Goodwyn was clerk of works, and the entire work was carried out under the superintendence of and from plans supplied by Mr. Vincent Craig, Architect, Lombard Street, Belfast.

**RIPON.**—At the monthly meeting of the City Council a plan was submitted of the proposed Victoria clock tower to be erected at the junction of North Road, Palace and Princess Roads. The structure, as designed by Mr. G. Corson, Architect, Leeds, will be 43ft. high, and have a base 10ft. square. In the centre, on the city side, will be a statue of the Queen, and the other side will bear shields with the Royal arms and the arms of Ripon and the diocese. The clock—which will have four dials—is being constructed by Messrs. Potts and Sons, of Leeds.

The Ripon Board of Guardians has approved of the erection of an infirmary for the Workhouse, plans of which have already been passed by the Local Government Board. The cost is to be £2650. The Building Committee recommended that the Architect, Mr. F. H. Hargrave, be also clerk of the works, and that he be paid £175 for the whole of the work, but the Board decided to have a separate clerk of the works. Mr. Hargrave asked £170 for his fees as Architect. A proposal that he be paid £155 was eventually carried.

**SWANSEA.**—At a meeting of the Re-building Committee of the Swansea Parish Church it was stated that the contractors (Messrs. Cornish and Gaymer) would complete the nave portion of the building by July 31st, and that the opening would take place on August 5th. It was further explained that it was not intended to consecrate the nave until the other part of the building had been completed. The nave portion of the building has cost £14,000 in construction, and it is estimated that £10,000 will be required to complete the chancel and tower.

**TORQUAY.**—Mr. E. H. Harbottle, Architect, of Exeter, after inspecting the tower of St. Marychurch, has presented a report of quite a serious character. To a large extent the tower will have to be rebuilt, or, at all events, in

many places the existing stones will have to be replaced. To prevent the tower possibly falling it has been deemed necessary to immediately shore up the entrance to the tower with heavy baulks of timber. The state of the tower is extraordinary, considering it was only built some thirty years ago at a cost of about £2000. A curious feature is that the top of the tower is the best built portion of the whole. Its great fault is that the stone used for decorative purposes, free-stone, was not laid on its natural or quarry-bed, and it has scaled off in large pieces owing to the action of the weather. Another fault is the quality of the mortar used, some of it being crushed to dust by the weight of the tower, and this is considered a serious element of danger in several places. To restore the tower the cost is estimated at about £800. Portland stone will probably be used, similar to that employed in the spire of the Roman Catholic Church close by, and in the tower of St. John's Church, Torquay.

**TORRY, N.B.**—The new Episcopal Church of St. Peter is at present in course of erection on the north side of Victoria Road, Torry. In its details, following on the lines of the late Scottish Gothic work, the building, when completed, will consist of nave, with porches on the north and south sides; chancel, with a chapel and bell-turret on the south; and sacristy and choir-vestry on the north sides. With the exception of the window tracery, which will be of free-stone, the whole of the exterior stonework will be of pink granite, the general surface of the walls of thin split-faced courses, all dressings for doors and windows being slightly axed. The roof, covered with Scotch slates, will be continuous over nave and chancel, its apex being 68ft. from the floor of the nave. The height of the nave walls will be 47ft. The nave arcade consists of five arches with piers 10ft. apart and 26ft. 3in. from the floor to the springing. The total length of the Church internally is 116ft. 6in., the width 52ft. 6in. The contractor for the mason work is Mr. John Morgan, Aberdeen. The Architects are Messrs. Kinross and Tarbolton, 18A, Howe Street, Edinburgh.

**WALTON.**—The new Bishop's chair, which has just been placed within the sanctuary of St. John the Evangelist's Church, Walton, has been designed by Mr. C. E. Deacon, Architect, of North John Street, Liverpool, in the Early English or thirteenth-century style of Gothic Art. The new episcopal chair is framed in massive oak. The back is carried high, terminating with a crocketed gable. Within the tympanum is a shield bearing the arms of the See of Liverpool, surmounted by a bishop's mitre. In the back rail, amidst carved foliage, occurs the date, 1897. The work was executed by Messrs. Harry Hems and Sons, of Exeter.

A MAUSOLEUM, to cost about £50,000, is being erected in Fairmount Cemetery, Newark, N.J., for Gottfried Krueger, a millionaire brewer of that city, which when completed will have few equals in point of architectural beauty in the United States.

The Cardiff Board of Guardians has purchased Llancarvan House for the purposes of a new dispensary office, and Mr. Edwin Seward, the Architect, has been instructed to prepare plans and specifications for the necessary alterations and additions.

An ancient window, of small dimensions, has been discovered in the north aisle of St. Michael's Church, Lewes, during the work of renovation. The window is believed to be of about the same period as the Priory in Southover, which was destroyed in the reign of Henry VIII., and it is proposed to place a figure in the cavity.

PERHAPS the smallest piece of painting in the world is that executed by a Flemish artist. It is painted on the smooth side of a grain of common white corn, and pictures a mill and a miller with a sack of grain upon his back. The mill is represented as standing on a terrace, and near it is a horse and cart, while a group of several peasants is shown in the road near by.

## Trade and Craft.

### BUILDING BYE-LAWS AT BRISTOL.

W. G. Lewis and G. Richards, builders, of Bedminster, were summoned for erecting two houses in a street before it was properly formed. Mr. Wise, who prosecuted on behalf of the Bristol Sanitary Authority, said the bye-laws provided that before any building operations were commenced the street had to be laid with a foundation of clinkers, &c. If this was not done before the Sanitary Authority took over the road, the occupiers of the houses had to walk through a perfect quagmire. Some builders seemed to think it an unnecessary provision, but the Sanitary Authority intended to see that the law was observed.—Defendants pleaded guilty.—A fine of 10s. each and costs was imposed.

### THE NECESSITY OF HOARDINGS.

The case of *Bridgwater v. Commissioners of Sewers of City of London*, heard in the Chancery Division last week, arose out of the preparations for the forthcoming Jubilee celebration. The plaintiffs brought this action for an injunction to restrain the defendants, the Commissioners of Sewers, from interfering with a hoarding and gantry (i.e., a covered way over the pavement of the street), erected by the plaintiffs in front of No. 56, Ludgate-hill, and alleged to have been approved by the Commissioners in January last. It was stated that the plaintiffs were erecting on the site of No. 56, under a building agreement, a large building at an expense of £15,000, and that by their contract they were under an obligation to complete the work by September 29th. It was admitted that no formal licence had been granted for the erection of the hoarding, but it was proved that a deposit in respect of a licence had been paid, and it was contended that an authority had been given and acted upon, that expense had been incurred by the plaintiffs on the faith of the acts of the officers of the Commissioners, and that therefore it was not competent to the Commissioners to revoke the authority. The neighbouring owner objected to the hoarding on the ground that it would obstruct his view of the Jubilee procession, and also that he could not let seats to view the procession while the hoarding continued. The Commissioners, deeming the hoarding unnecessary at the present time, had caused it to be pulled down. On the part of the plaintiffs it was stated that the hoarding was necessary in order to enable them to complete the works within the time stipulated, and that it was impossible for them to wait for the re-erection of the hoarding until after June 22.—After some discussion, terms were arranged between the parties. Mr. Justice Kekewich ordered that the costs should be paid by the defendants.

### MESSRS. SHANKS AND CO.

The sanitation of ships is not the least important of the many branches of Messrs. Shanks and Co.'s extensive business, and their new catalogue dealing with this section is replete with illustrations of interesting novelties. Baths, closets, cisterns, drinking fountains, hoppers, lavatories, &c., all come within the scope of their enterprise, and all are alike apt subjects for new and ingenious treatment. Among the new features we may mention the new "Britannia" under water-line closet, the chief characteristic of which is that in the event of mistake, the whole closet can be unscrewed from the discharge and supply pipes, and the defect made good without any disturbance of the discharge pipes or having recourse to plugging. The "Nautilus," Shanks' latest closet for ships, marks a new departure in this line of sanitation, containing as it does the adaptation of the syphonic principles to ships' closets. The basin is made in one piece, of strong fire-clay, and is provided with the firm's patent "Perfecto" seat extension. A new system of bath-heating for ships is also illustrated in the catalogue under notice. The heater can be combined with the standing waste, and a much more compact arrange-

ment is thereby secured. Sheet metal basins have lately claimed the attention of Messrs. Shanks and Company; and it is a form of basin which is often preferred on account of its lightness and non-liability to fracture. Lavatories are made in various designs, a collection of folding examples being particularly worthy of notice. They have no supply tanks, but are fitted with a patent combined hot and cold supply tap, or cold tap only, with a small receiver fitted with connection for waste pipe. Some of the folding lavatories are very elaborate in their ornamentation, and the woodwork of the casing can be stained and polished any shade to match the surroundings. The catalogued collection of baths is strikingly varied, and new designs of fountains are also shown.

## Enquiry Department.

To the Editor of THE BUILDERS' JOURNAL.

SIR.—I shall be obliged if you will describe the difference and give the reason of name in the following:—British plate glass, British polished plate glass, patent plate glass, rough plate glass, Hartley's  $\frac{1}{4}$  in. rolled, rough cast plate, rough hammered plate.

Yours obliged,  
ENQUIRER.

Farnham, May 28th, 1897.

*British Plate Glass.*—This glass is cast upon a table which gives it whatever smoothness or polish its surface possesses. It is usually sold as "ordinary glazing."—*British Polished Plate Glass.*—This is cast in the same manner as the above, and the upper surface, which cools with slight and hardly perceptible waves, is afterwards polished with emery-wheels, and finished off with rouge, &c., to an absolutely true and highly polished surface. It is sold as best glazing, or, if of a very even thickness throughout, as silvering quality.—*Patent Plate Glass* is similar to the above, but is specially thin; is polished upon both its sides, and is specially adapted for air-tight show cases and the best looking-glasses on account of its lightness for the first purpose, and the thinness for the second purpose, for the less thickness of glass there is between the silver, the more beautiful and brilliant the mirror.—*Rough Plate Glass* is composed of the commonest quality of glass cast in sheets.—*Rough Cast Plate* is very similar, but is of special thicknesses, and often cast to special sizes.—*Hartley's  $\frac{1}{4}$  in. rolled.*—This is cast (not blown) glass, and, after the molten metal is poured upon the casting table, rollers with grooves in them are run over it giving it that corrugated appearance which is formed of small flutes in the glass; all the new, fancy glasses, such as Muranese, &c., are made in the same way. Hartley's rolled plate glass can also be obtained  $\frac{1}{4}$  in.,  $\frac{1}{2}$  in., and  $\frac{3}{4}$  in. thick, it is made in a large pattern having about four flutes to the inch, and a small pattern about eleven flutes to the inch. The process of rolling, in addition to the pattern it impresses upon the glass, hardens and consolidates the sheets.—*Rough-Hammered Plate Glass* is not much used now. Years ago, before Hartley's patent glass was invented, it was used where strength was required, as the process of hammering consolidated it similar to what is described above under Hartley's, but the latter has for many years superseded it, and, although it can be specially ordered, and would in consequence be invoiced as hammered, it is more than probable that in most cases ordinary rough-plate glass is all that would be supplied.—ED.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR.—In the final R.I.B.A. Exam. a design is required among the Testimonies of Study. Have you had any paper, &c., on Design published? I don't remember. Or may I ask what you think would be best to do for this branch?

London students have a great advantage over Provincial fellows in getting up the exams. There are no lectures or classes what-

ever in Newcastle, except building construction.

The papers on "Iron Roofs" appearing in your journal I have found very useful.

Yours faithfully,

M. G. M.,  
Student, R.I.B.A.

We do not quite gather from your question whether you wish for advice "How to Design," or whether you want to know a subject suitable for the purpose of the examination. If the former is what you mean, we cannot, any more than others can, give you explicit instructions, for the simple reason that you ask for something impossible. No one can tell you *how* to design or *how* to draw. You must carefully study old examples, not for the superficial things in them which may please you, and which, more often than not, are the result of accident, but for the reasons which underly the design—the anatomy of it. If you carefully study the work of the modern masters, such as Norman Shaw, the younger Scott, Bentley, Sedding, Stokes, &c., in a similar manner, you will find all the qualities which obtain in the work of the old men equally apparent in these also. You cannot have better guides. But *don't* attempt to copy. Try and reason out clearly everything you do, and have a definite answer as to why you did this or that, and then your work can never be bad. Let your elevation express, in the simplest manner possible, your plan, and place no features for the sake of what you think may be "effect" only. We would advise you to read most carefully, and think out every sentence well, of Beresford Pite's excellent essay on "Design in Drawing" in recent numbers of *The Architectural Review*. If you follow his advice in as simple and direct a manner as you can, you are sure not to go wrong. But weigh his words carefully and well. The same remark applies to *Drawing*. We should advise you to get Ruskin's "Elements of Drawing." Consider each sentence there as a collection of precious stones. They are worth more to you than jewels. They contain some of the wisest words ever written upon drawing and design, and will never fail to help. As to a suitable subject, choose a simple one, such as a house to cost about £2000, or a public library or museum for a small county town.—ED.

THE work in connection with the new police court at Highgate, which is to be built at the junction of Archway Road and Church Road, near the Highgate station of the Great Northern Railway, has just been commenced.

MR. E. E. GEFLOWSKI, a sculptor who has executed many important works, has just completed a statuette, a reduction of his large statue of the Queen at Singapore. This statuette, which has been submitted to, and approved by, the Queen, is to be reproduced in plaster and various metals.

MR. STOREY is now hard at work at Rome upon the memorial bust of the late Lord Randolph Churchill, which is to be placed in the members' entrance to the House of Commons. When completed, the bust will be placed on a small bracket immediately facing that of the late Mr. W. H. Smith.

SOMETHING like 496 applications have been received at Spring Gardens for licences in respect of temporary structures to accommodate persons desiring to see the Jubilee procession. Of those 328 were granted and 33 refused, the remainder being under consideration. The City Architect has made many alterations in the plans, and all applicants have been warned to prevent overcrowding and take precautions against the risk of fire.

THE Bill to authorise the acquisition of lands known as Churchyard Bottom Wood, Highgate, for the purpose of a public open space, gives power to the Ecclesiastical Commissioners to sell the woods in question to the Hornsey District Council, which is to keep it open for public use for purposes of exercise and recreation, it being specially empowered to erect in the woods a suitable keeper's lodge and a shelter for public use.

## SOCIETY MEETINGS.

**Sheffield Society of Architects and Surveyors.**—The Sheffield Society of Architects and Surveyors inspected the Deepcar works of Messrs. J. Grayson Lowood and Co. Limited, silica brick and glazed brick manufacturers, on the 29th ult. The firm's manufacture of bricks draws upon a practically inexhaustible store of ganister underlying a large portion of the estate of Lord Wharfedale. The ganister is of an average thickness of three feet, and overlying it is a bed of coal from eighteen inches to two feet thick, which just serves to feed the brick kilns of the firm. As won from the mine the ganister is exceedingly hard. The first process on arrival at the pit bank is the breaking of the ganister, for which, as the party saw on Saturday week, some very powerful machinery is required. After the crushing the ganister is ground down with water into a stiffish paste, and then moulded into bricks. The machinery of these various processes for silica brick-making is very ingenious. From the moulding presses the bricks are conveyed to drying floors—chambers with cast-iron floors, the temperature of which can be regulated to a nicety by means of steam. After the drying floors come the kilns, and the silica brick is then a finished product. An equally important branch of the firm's activities is the manufacture of fire-brick and tuyeres, stoppers, nozzles, &c.—articles in great demand in the steel trade of Sheffield.

**Bristol and Gloucester Archaeological Society.**—Brimpsfield Church, which was visited by the Bristol and Gloucester Archaeological Society a few days ago, is a most interesting building. At the entry to the chancel, a tower has been let down in a most curious fashion into the building, cutting into the Early Norman arch of the chancel, and slicing off the later Early English pillars that supported an earlier bell turret. Arches have been thrown from these to the outer walls to form supports, and hagioscopes cut through to permit of a view of the high altar that stands against the dead east wall unlit by any window. Without, the Church formerly stood on the north of the priory, and to the south-west the famous castle that played so great a part in local history in mediæval days. Elkstone Church, which was also visited, was found to be full of strange detail and minute work. On the tower were sculptured on the buttresses strange figures of men playing mandoline and clarinet, with dogs perched above them. The interior is deeply interesting, the east window being exceptionally quaint and unique. The great gargoyles upon the upper part of the tower are strangely grotesque.

**Iron and Steel Institute.**—In accordance with previous announcements, the autumn meeting of the Iron and Steel Institute will be held at Cardiff on August 3rd, 4th, 5th, and 6th next, at the house of the South Wales Institute of Engineers, Park Place, Cardiff. Visits will be made to the Bute Docks, the Cardiff-Dowlais Works, Penarth Docks and other works on the Taff Vale Railway, and the Dowlais and Cyfarthfa Steel Works. A reception will also be held at the Free Library, Art Gallery, and Museum Building by the Mayor. A ball, given by the Marquess of Bute, and a Welsh concert at the Park Hall, are also included in the programme. A detailed programme will be issued when the local arrangements are further advanced, which will also contain a list of the papers that are expected to be read.

**British Archaeological Association.**—At the eleventh meeting of this Association, held at the rooms in Sackville Street, Mr. C. H. Compton, vice-president, in the chair, Mr. Quick, the curator of the Horniman Museum, exhibited some curiosities recently brought from Benin by some of the officers engaged in the late expeditions. These curious objects had been saved from destruction by fire at the time of the capture by reason of their having been in a stone house. One of them was a carved ivory staff of office, having the representation of a human figure holding a peculiar form of bell in an inverted position; this form of bell, it was said, was found only on the West Coast of Africa. This staff was

carried by the executioner or one of his attendants, and its ornamentation showed evidence of Portuguese influence. Another object from the same region was a carved wooden case, having a sliding cover bearing the image of the sacred bird (the Ju-Ju bird). This case was used for the transmission of documents. An armlet and bracelet belonging to one of the wives of the king was also exhibited. Mr. Quick also exhibited some prehistoric implements found in excavating further foundations of a house near the Victoria Embankment, consisting of the remains of a weapon or instrument formed from the antler of a deer, also the shank-bone of a horse or an ox.—Mr. J. Cave Browne exhibited a seal bearing a foreign coat of arms and coronet, which seal was given by a dying French officer to an English officer, who had given him a drink of water upon the field of Waterloo.—Papers were read in the absence of their authors by Mr. Patrick, Hon. Sec., from Mr. J. T. Irvine, descriptive of some prehistoric flint instruments found at Overton Longaville, in Huntingdonshire, by the Dowager Marchioness of Huntley, which were illustrated by some very careful drawings. The other paper was explanatory of some recent discoveries on Brandon Hill, Bristol, by Dr. Fryer, where, at an early date, a hermitage and chapel were erected, but the first known occupant of which was Lucy de Newchurch in 1351. These discoveries were made during the excavations for the foundation of the Cabot Memorial Tower, which is to occupy the site of the ancient hermitage. The excavations had been carried down to the millstone grit rock, of which the hill is composed, when a flooring of thin cement was met with, and on the removal of a portion of this floor a well-made grave was found, measuring 5ft. 6in. in length, and about 2ft. deep, tapering from the shoulders to the feet. The grave lay east and west, and was carefully lined with masonry. The grave contained a skeleton, and close by were found the remains of two other skeletons. Some fragments of green glazed tiles were also found. The excavation produced several beds of ashes and dark-coloured earth, and some early tobacco-pipes and leaden bullets, which were found about 4ft. above the earlier remains, indicating pretty distinctly the position of camp fires during the sieges of Bristol in 1643-4. Dr. Fryer also contributed a short note on the composition of an Inca ornament, derived from the analysis of the metal of which it was composed.

**The Surveyors' Institution.**—Mr. Daniel Watney presided at the annual general meeting of the members of this institution at the temporary offices, Savoy Street, Strand. The 29th annual report of the council showed that during the last twelve months there had been a net increase of 112 in the number of all classes on the roll, the total membership now being 2702. The total revenue for the year was £7334, and the expenses amounted to £5596. The total investments calculated at current prices now represented a sum of £35,226. At the preliminary examinations in January last, held simultaneously in London, Dublin, and Manchester, there were 133 student candidates, of whom 91 passed; and of 236 candidates who offered themselves for the professional examinations, 151 passed. The council congratulated the members on the progress of the institution during the past year in every one of its numerous channels of activity. The report was adopted on the motion of Mr. A. Harston, seconded by Mr. Ernest Swain.

**The Lancashire Federation of Building Trade Employers.**—The fourth half-yearly meeting of the Association was held at the Bull Hotel, Burnley, on Tuesday, June 1st. The President, Mr. Cunliffe, Bolton, was in the chair, and, in moving the adoption of the report, said that the past half year had been a busy one, and, though there had been no large accession of strength to the Federation, much work had been done to extend the organisation. Manchester had not yet become affiliated, but there was undoubtedly a growing feeling among employers there favourable to their cause. He hoped to see the time when these federations, having become general, should be amalgamated in one central or national body,

and then they would be strong enough to defend their interests and attack the abuses which undoubtedly existed.—The Secretary report stated that one local association, Warrington had joined during the half year but as two of their smaller branches had become for a time disorganised, the strength of the Federation remained about the same as before. The relations with the operatives were reviewed at some length, the disputes at Chorley, Colne, Blackpool, Preston, &c., were dealt with, and detailed account given of the action taken with reference to the numerous demands throughout the country for advances in wages or alteration in the working rules.—The report was adopted and ordered to be printed and circulated; the treasurer's accounts, which showed a large balance in favour of the Federation, were presented and approved.—Mr. James Storrs, of Stalybridge, was unanimously elected President of the Association for the ensuing year. Mr. W. Cunliffe, Bolton, was elected Vice-President; Mr. J. H. Thompson, Bury, Hon. Treasurer; and Messrs. W. Shepherd, Rochdale, and J. Tinline, Bury, Hon. Auditors. The secretary, Mr. John Tomlinson, 11, Croft Street, Preston, whose two years' term of office expired, was unanimously re-elected for a similar period.—The New Employers' Liability Bill was considered, and in view of its provisions, which seem likely to become law, it was deemed advisable that the Executive should take into consideration the best means of protecting the members, either by the formation of an Accident Insurance Company on mutual lines, or by endeavouring to obtain more favourable terms for federated employers.—A long discussion took place on the anomaly in the Operative Masons' Trade Rules in the different towns respecting sawn and read-worked stone, and ultimately, on the motion of Mr. Parker, Longridge, seconded by Mr. Smith, Burnley, it was decided to test the feeling on the subject by a vote of the federated employers.—The subject of the railway companies' crane charges for stores &c., was considered, and on the motion of Mr. A. Lewis, Blackburn, seconded by Mr. Tinline, Bury, it was decided to take united action with a view to obtain a modification of the charges.—A hearty vote of thanks to Mr. Cunliffe, Bolton, for his services as president during his year of office, was received with acclamation.

It has been resolved to pull down the historic but dilapidated old workhouse, Havel-street, Camberwell, at "the earliest possible date." This decision has been forced on the Guardians through the insanitary state of the building.

## Announcements.

## Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to pay postage. All matter must reach the Editor by the first post on Monday morning to ensure its treatment in the current issue.

## Publishing.

The terms for free post Subscription to any part of the United Kingdom are SIX SHILLINGS AND SIX PENCE per annum by half-yearly or annual prepayments.

## Advertising.

SITUATIONS WANTED, SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS. Per line, Sixpence. Minimum charge, eight pence. Three Insertions for the price of Two. Prepayments in the above advertisements is absolutely necessary. Page or Paragraph Announcements, Trade Advertisements, Auction Sales and Contracts Open. Prices on application. Small Advertisements for current week's issue received up to first post Monday morning included.

Editorial and Publishing Offices  
Effingham House, Arundel Street,  
Strand, W.C.

# TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

**BRISTOL.**—For alterations to Messrs. Jolly and Sons' Messrs. College Green, Bristol. Messrs. R. Milverton Drake and John M. Pizey, Architects.—  
A. J. Beaven ... £2,430 | T. H. Brown\* ... £2,370  
\* Accepted subject to slight deviation.

**BURSLAM.**—For the erection of offices, Moorland-road, for the Potteries Stipendiary Commissioners. Mr. Edwin Penn, Architect, Stoke-on-Trent.—  
Chas. Cope ... £1,423 | J. H. Broadhurst ... £1,105  
Hall and Robinson ... 1,108 | W. Simpson ... 1,104  
G. A. Foster ... 1,190 | N. Bennett ... 1,101  
W. Cooke ... 1,183 | Grant and Son ... 1,089  
Bagnall ... 1,157 | J. J. Longden, Burslem\* 1,054  
Valley and Wooliscroft 1,149  
\* Accepted.

**CANNOCK (Staffs).**—Accepted for the construction of new, &c., for the Urban District Council. Mr. Jno. Peake, Surveyor, Council Offices, Cannock.—  
Enoch Blewitt, contractor, Hednesford ... £1,749 15

**CARNARVON.**—For the construction of a sea wall. Mr. W. Bowen Jones, Engineer, Harbour Offices, Carnarvon.—  
Geo. Webb & Co. £2,761 12 6 | Owen Morris, Carnarvon\* ... £2,750 0 0  
\* Accepted.

**CASTLEFORD (Yorks).**—Accepted for the erection of a public hall and offices, Jenson-street, for the Concert and Lecture Hall Company, Limited. Mr. R. M. McDowall, Architect, Castleford.—  
Excavating, Bricklaying, and Masonry.—  
A. S. North, Castleford ... £1,950 0 0  
Carpentering, Joining, Plumbing, and Glazing.—W. Wilson & Son, Castleford 1,360 0 0  
Slating.—W. Allison, Castleford ... 102 10 0  
Plastering.—G. W. Binns, Castleford ... 835 0 0  
Painting.—J. H. Butler, Castleford ... 84 16 6

**CULLEN (Banffshire).**—Accepted for the erection of a dwelling-house, North Castle-street, for Mr. Alex. Runcie. Mr. Jas. Perry, Architect, Buckie.—  
Masonry.—J. Stevenson, Cullen ... £45 10  
Carpentry.—W. Davidson, Cullen ... 107 5  
Slating.—A. Mitchell, Cullen ... 24 18  
Plumbing.—W. Beveridge, Cullen ... 12 0  
Plastering.—J. Ingram, Cullen ... 23 10  
Painting.—J. Murray, Cullen ... 5 10

**FOLKESTONE.**—For the supply of 3,000 tons granite, &c., for the Corporation. Mr. John White, Borough Engineer, Town Hall, Folkestone.—

Perfect Sanitation, Healthy Houses  
OBTAINED BY ADOPTING THE  
**"TWYCLIFFE"**  
Patent Pedestal Syphon W.C. Basin.  
A new Departure, embodying the latest developments in Sanitary Science, as applied to W.C. Basins.  
Advantages claimed for the "TWYCLIFFE" Syphon:  
Perfect safeguard against sewer gas and the evils arising therefrom.  
Extra large water surface and great depth of water seal (3 inches) and large body of water in Basin to receive and deodorise soil.  
Practically noiseless in action.  
Simple in construction, reliable in action.  
No complicated mechanism to get out of order.  
Easily fixed as an ordinary Basin.  
High-Class Article of Superior Material, Workmanship and Construction.

# Surveying and Sanitary SUPPLEMENT.

JUNE 9TH, 1897.

## ON THE CONSTRUCTION OF JUBILEE STANDS.

By E. J. GIFFORD READ.

THE demand for seats to view the forthcoming Diamond Jubilee procession is calling forth efforts on the part of private individuals, syndicates, and public authorities, to meet the demand by special construction, in the one case to increase the accommodation of private houses, and on the other to utilise to the utmost every vacant piece of ground or open space adjoining the thoroughfares passed over by the procession. So energetically is this work being pressed, and so enormous are some of the undertakings, that, when the day arrives the streets of London will probably form a spectacle as unique in the way of display and decorations as the occasion which has called it forth.

Although the erections along the route may be termed temporary structures, many of them are quite monuments of construction, and are the outcome of considerable scientific and artistic ability on the part of eminent Architects and engineers.

The erections may be conveniently grouped under two heads; first, those on open spaces; and, secondly, those in, or attached to, existing houses. Many of the open spaces and vacant plots have been acquired by speculators at enormous cost, and, in order to accommodate the greatest number with the best view of the procession, several stages have been erected with tiers of seats above each other; indeed, in one stand there are as many as three tiers, making a total height of nearly 50ft. The simplest form is that of one tier on the ground-floor, and the difficulties of cost and construction increase in accordance with the height and number of stages adopted.

Before proceeding to describe particular stands, it may be as well to consider what are the leading principles which should guide their construction.

The procession passes along a certain determined line, and the positions of the stands, and consequently those of the sightseers, are at various distances and directions from it. It becomes, therefore, very necessary to give the tier of seats such an inclination that everyone may sit comfortably and see the show.

For instance, in the diagram Fig. 1, if the stand be facing a wide thoroughfare 55ft. from the centre line, and the crowd of people be allowed to be as far as X, the eye of the lowest person on the stand must not be below the point A, and the slope of the first tier of seats must be steeper than the line OA as at A B. The second tier must be steeper than OC as at C D, and so on; but, supposing the stand to be against a narrow street only 25ft. from the centre line, and the crowd to be as far as x, then the sight line of lowest tier must not be below a, and the slope of the seats will be as at a b. The sight line and slope of the second

tier will be as cd, the third at ef, &c. Thus the view from the first tier may be more favourable than that of the former stand, but the upper tiers increase so rapidly in steepness as to be almost prohibitive at g h, whereas, in the former case they would only have a moderate slope as G H.

Another point to be observed is that the flooring of the seats above any particular stage must be sufficiently high to allow of an extended view to those seated below. This applies more particularly to places from which a distant view can be obtained of

out in the stand in front of the National Gallery facing Trafalgar Square.

As to the accommodation to be given each seat, it might be remarked that an ordinary rush-bottom Church chair occupies 1ft. 4in. in width, and a third-class Metropolitan Railway carriage, which cannot by any stretch of imagination be considered as luxurious, gives 7ft. 8in. to five persons, or 1ft. 6½in. each, a fair allowance per seat would be 1ft. 6in. in width by 2ft. 6in. back to back, this will allow of persons passing those seated, and as people must in the majority of cases be in their seats

FIG. 1.

the procession either approaching or departing from the stand, and of course need only be considered in stands of more than one stage.

In a single stage on the ground-floor the construction is a comparatively simple matter, as the posts and bracings being under the seats their number and position can be varied at pleasure; but when a second and third stage have to be constructed above it, the difficulties begin, from the fact that the fewest number and smallest size of posts must be used in order to obstruct the view as little as possible, in some cases a few large posts are used and intermediate ones provided of small iron pillars.

The maximum number which a stage will accommodate obviously necessitates the minimum space to be allotted to each seat, many of the stages are formed with steps on which hired chairs are placed; in others the steps are formed into continuous benches, this is carried

a considerable time, it is better to exceed the above dimensions rather than diminish them.

The number of seats can thus be estimated for any selected site, and the method of carrying them may be considered. In most cases, when procurable, 6in. square posts will be used, and these should be braced both ways, at intervals of about 8ft. in height, thus leaving a maximum height of pillar sixteen times the diameter. A fir-post under such conditions would carry about five tons. Then, in order to determine the distance apart of the posts, it is necessary to estimate the load coming upon the structure.

An average person seated will weigh about 10st., or 1½cwt., and if we allow ½cwt. for timber, this will make 1½cwt. per seat, double this for the chance of people passing each other on any particular timber, and we have 3cwt. per seat, which, I think, amply sufficient for all these temporary structures.

However, the County Council, after carefully

going into these matters, have decided that all the parts of the stands must be proportioned to bear a load of 1cwt. per foot super, irrespective of the size of the seat. This would give for the seat I have taken above, 2ft. 6in. by 1ft. 6in., a load of 3½cwt., and for 3ft. by 1ft. 8in. 5cwt., instead of the 3cwt. stated.

The 6in. square post, carrying five tons, must therefore not bear more than 100 square feet, or they may be placed 10ft. apart each way. Assuming the posts to be placed 10ft. apart, the main bearing beams should follow the slope of the stand and be halved on to each post. This will form a series of sloping trestles which must be held together with collar beams, and braced transversely to keep them upright as in Figs. 2 and 3.

At this distance apart of main beams the seating will have to be carried by transverse beams or purlines as at A, and the boarding of the steps will be in short lengths nailed across the step. But it is generally found more convenient to put the trestles closer together or to introduce one or more intermediate beams as at D E.

The boarding can then be nailed in long lengths with the step instead of across it, the thickness varying from 1½ to 3in., according to the spacing of the beams. When the stand is on or near the ground the slope is usually very moderate, and the steps can be formed by simply nailing checks on to the raking beams, as at C in the above figure; but when the stand is high above the ground, the slope of the beams is much greater, and stools have to be made for the steps, as at A or B. If hired chairs are to be used, they are simply placed on the steps and secured together by battens, otherwise small secondary stools or benches are built along on the front part of the step, as shown at F.

(To be continued.)

A SELECT Committee of the House of Commons has had under consideration the City of London Sewers Bill, under which it is proposed to dissolve the Commission of Sewers of the City of London, and to provide for the execution of the powers, duties, and authorities of that Commission by the Common Council of the City. Mr. Gabriel Goldney, Remembrancer of the City of London, was taken at length through the various statutes which had been passed with reference to the Commission, the first dating back as far as 1662. The Corporation was simply asking for powers that had been conferred on other boroughs in the kingdom by the Municipal Corporations Act of 1882. Other evidence having been given, Mr. Pember addressed the Committee on behalf of the City Council, after which the Chairman announced that the Committee found the preamble proved.

# THE PRACTICAL DESIGNING OF IRON AND STEEL ROOFING.

(Continued from page lxvii.)

BY ALEXANDER DREW.

## No. V. OF SERIES.

THE manner in which these struts can be connected to the rafter, or at their lower end to the ties, is very varied; and only one or two simple suggestions can be indicated. No. (14) shows a strut of round section with the upper end formed either into an eye or a jaw (see further on), while the lower end is reduced in size, and provided with screw and nut. The L section strut is shown at (15), the upper end having one side folded on to the other, thus giving greater stiffness and thickness at this point where the bolt or rivet hole is formed; the lower end is shown as split up and set round to form a kind of jaw, between which the main ties can be set, and connected by a single bolt; it should be noted that ordinary iron will not stand such treatment as that just described, a very good quality of iron or mild steel is required to allow of this working, and to resist the tendency the bar has to split up the centre during this setting. At (16) the upper portion of the T strut is cut

off square and allowed to butt against the lower edge of the rafter, to which it is connected by means of a junction-plate on each side; at the lower end two arrangements are shown; in the one the table is notched away for a certain distance, and the web is allowed to pass in between the lower junction plates; in the other arrangement two set or bent plates are rivetted to the end to form a jaw, of much the same type as the lower end of (15). (17) shows a side view of a double flat strut, these flats are set in somewhat the manner shown, and kept in position by rivets and packings at intervals, thus giving the required side stiffness to the strut; it may be noted that this curve should be more or less regular, and that the packings or distance pieces should be placed sufficiently near together to check any tendency the bars may have to yielding in the direction of the thickness. As an example of how-not-to-do-it, the dotted lines at the upper extremity show how such a strut is sketched in some text-books; it will be obvious that any compressive strain will tend to force the bars outwards at the projecting angle near the top, and as no distance piece is at this point, there is little to resist this tendency, and consequently the member is considerably weakened by such an unnecessary and unpractical formation. With double angles, as at (18), it is usual to carry these up to the root of the rafter, and pass the bolt or rivet right through. The same arrangement, where possible, is used for (19), except that the web is here shown as cut away to allow more space for the connecting bolt. In (20) the same arrangement is indicated.

In passing from struts to ties, it will be found that the number of different sections here used is considerably limited. The usual section is that of a solid round rod; but occasionally flat rectangular sections may be used, and these latter, as will be presently seen, have in some cases an advantage over the round section. If the ties be also subjected to cross bending, as where the main tie is used to support a ceiling or such like, the section must then be chosen such as will give the required stiffness, either flat, L, T, H, or channel may be used, as the particular circumstances demand. In the case of the first noted section, that of the solid round, it would be a very wasteful and most unpractical method of connection to simply drill a hole through this bar to allow of its being connected to the other members; what is always done is that the ends are shaped in some manner so that a convenient connection may be made, and the full strength of the bar be retained throughout. There are practically three forms which these end connections take, the first called an eye, the second generally termed a jaw or double eye, while the third is the screwed

FIG. 3.

nd. In forming these ends the assistance of the smith is required; and while the particular style or shape may be modified to a very great extent, it should be particularly borne in mind that in nearly every case the simplest and easiest made form, and that which entails the least amount of welding, is undoubtedly the best. Occasionally it is necessary to keep in view the appearance or neatness of the framework, and in such a case only is it justifiable to employ many of the more or less elaborate styles of tie ends which may be met with in many existing structures, or in most text-books on this subject. At present it is only necessary to consider two types of eye, that shown at (A) and (B); the first is that generally known as a "Balled Eye"; the second or ornamental type may be called a "Peened Eye." To understand the relative cost and efficiency of these two forms it is necessary to study the manner in which they are produced; but only a word or two can be said on this point here. In the first case the rod is cut to the required length, and round its end is clipped a wrought-iron ring; this end is now put into the fire, and when it has been brought up to a welding heat, it is placed in a special tool under the steam-hammer, and quickly worked up into the form of a solid ball at the end of the rod; while this is still hot, it is placed between the ordinary faces of the steam-hammer, and flattened out till the ball is reduced to about the thickness of the rod, after which the bolt hole may be either punched out while still hot, or drilled afterwards when the eye has cooled. In the second form of eye a flat bar of about the section of the eye itself is taken, and while hot is gradually worked into the shape shown, a short length of round section being made beyond the octagonal portion of the shaft; when this has been done the rod which has to form the tie is taken, and this separate end is welded or shut on to the same. A very little consideration of what has just been said will show the values of these two forms; in the second case a considerable amount of time and cost is involved in the working of the solid bar into the shape required, and afterwards welding on to the rod; and this latter portion is in itself so difficult to ensure a thoroughly good connection, even when the most skilled workman is employed, that it is well whenever possible to reduce such joinings to a minimum. No practical means has yet been devised by which a weld can be tested, and it is by no means unusual that the best looking finish may cover the worst result. The first method practically dispenses with this weld, and is easily and quickly made, so that for all purposes in which appearance is not absolutely essential, the "Balled Eye" is undoubtedly the cheapest, and by far the best.

Turning now to jaws, it is unfortunate that

practically no means exist whereby welding can be here dispensed with, as in the balled eye just noted; but while this is true, it is possible by a little care to reduce this smithing and welding to its simplest and cheapest form. (C) and (D) show two forms chosen to illustrate this; in both cases the two halves of the jaw are first formed, these are then welded together, and the shank formed, the whole being afterwards welded on to the rod itself. In (C) the two halves are welded together in as simple a manner as possible, and no elaboration is attempted with the shank; but in the case of (D) the halves must be specially shaped, and particular care and trouble is necessary to produce the close rounded inner corner between the jaws, while time and money is spent in forming the octagonal shank. Some might claim a better appearance for this jaw, but where this can be dispensed with (if it is admitted that such does exist) the first described jaw is the cheaper and the better one.

The last form of end noted is that in which a screw is provided, nuts being supplied to make the necessary connection. If the rod be of very ample strength for the stress to which it is subjected, the usual arrangement is to cut the screw direct on the rod itself (E); this, of course, implies that the rod is weakened to fully the extent to which the thread is sunk into the material. Should the full strength be desired, the end may be formed with an "Enlarged Screw" as at (F); that is to say, the diameter of the screw is so much increased that its strength is at least equal to that of the rod itself. If a tie with a screwed end forms an important member in the structure, special care should be taken in specifying how this end is to be formed; of course, there is no difficulty when the screw is cut direct on the rod, but in the case of an enlarged end, if the length be small it should be specified that the rod be *upset to form the extra thickness*, and the screw cut thereon. Where the length of screw is considerable, this upsetting (which is done by heating the rod for the required length, and striking it on the end in the direction of its length, so as to swell out or enlarge the diameter at the heated portion) would probably be difficult to perform, and in such a case it might be necessary to allow the enlarged end to be welded on.

CALVERLEY District Council has decided to carry out a scheme of sewage disposal. The sewage will be carried by means of a pipe from the present terminus of the outfall through an existing culvert under the Leeds and Liverpool Canal, and thence by gravitation to a point on the farm where precipitation tanks will be constructed.

## Surveying and Sanitary Notes.

MR. RIENZI WALTON, C.E., Inspector to the Local Government Board, held an inquiry in the Council Chamber, at the Bradford Town Hall recently, into the application by the Bradford Corporation for sanction to borrow £50,000 for works of sewerage and drainage. The Town Clerk said the proposed sewers would comprise new ones required for the drainage of districts in the borough, new sewers to replace old sewers which were no longer suitable, and special relief sewers for the carrying off of storm water. From time to time £282,000 had been expended in the construction of sewers alone, in accordance with the main sewerage scheme of Bradford, and these works were distinct from sewage disposal works. That total amount had all been expended, and £50,000 was required to go on with the scheme. The total amount which the Corporation was authorised to borrow under the provisions of the Sanitary Acts and Public Health Act was £1,593,680. Nearly the whole of that amount had been borrowed from time to time, while £474,462 had been repaid. However, the Corporation was well within its powers, because the annual rateable value of property within the borough was £1,097,661.

At an inquiry at Launceston respecting the application of the Town Council for powers to borrow £4000 for sewage disposal works, the Town Clerk stated that at present the town was drained by four sewers—the central sewer draining houses north of the Church tower and falling into the Kensey near the goods shed of the Great Western Railway Station; the western sewer draining the west end of the town, and connecting with the central sewer of St. Thomas; the Dockacre sewer draining Broad Street, Church Street, and the eastern side of the town, and falling into the Kensey about 300 yards west of Ridgeway Mill; and the St. Stephen's sewer draining the urban parish of that name, and falling into the Kensey near the outfall of the present sewer. It is proposed by the new scheme to lay a 12in. main sewer from the outfalls of the existing sewers and carry the sewage for 1½ miles to sewage disposal works to be constructed near the South-Western Railway, abutting on the Tamar. There the sewage will be strained and mixed with a precipitation, and run into settling tanks, whence the sludge will be drained off periodically, and dug into the land, the clarified liquid being filtered through special filter beds and finally run over 2½ acres of land, whence it will be discharged into the river by clear-running water.

## COMPLETE LIST OF CONTRACTS OPEN—continued.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
<b>BUILDINGS—Continued.</b>			
June 17	Barking, Essex—Retort House (83ft. long by 60ft. wide)	Gas Company	Company's Office, 55, High Holborn, London.
" 17	Delph, near Oldham—Shed (3000 square yards)	Guardians	J. Kirk and Sons, Architects, Huddersfield.
" 17	Dewsbury—Cottage Homes		Holton and Fox, Architects, Westgate, Dewsbury.
" 17	Halifax—Villas (three pairs)		M. Hall, 29, Northgate, Halifax.
" 18	Chartham, near Canterbury—Chimney Shaft, &c.		W. J. Jennings, 4, St. Margaret's-street, Canterbury.
" 19	Denny, Scotland—Dwelling-houses (Thirty-six)	Co-operative Society	R. M'Lelland, Architect, Motherwell-road, Bellshill.
" 19	Oswestry—Alterations, &c., Club		Shayler and Madoc-Jones, 19, Church-street, Oswestry.
" 21	London, S.E.—Fittings, &c., New Dulwich Library	Vestry of Camberwell	C. W. Tagg, Vestry Hall, Camberwell, S.E.
" 23	Leven, Scotland—Hotel		Swanton and Legge, 196, High-street, Kirkcaldy.
" 24	Liverpool—Offices	Royal Insurance Company	J. F. Doyle, 4, Harrington-street, Liverpool.
" 24	Salford—Artisans' Dwellings (Sixty-six)	Corporation	Borough Engineer's Office, Town Hall, Salford.
" 25	Aughur, Co. Tyrone—Repairs, &c.		Rev. F. Doherty, Tully House, Augher, Co. Tyrone.
" 25	Hampton, Middlesex—Engine-house, &c.	Urban District Council	T. Shone, 47, Victoria-street, Westminster, S.W.
" 28	Corsham, Wilts.—Additions, &c., Mansion House		Office, T. Holloway, Chippenham, Wilts.
No date.	Newport—Hospital	Hospital	R. J. Lovell, 46, Queen Victoria-street, E.C.
"	Chell, Staffs.—Additions to Workhouse	Wolstanton and Burslem Union	W. H. Walley, Architect, Burslem.
"	Hull—Additions to Stepney Paper Mills	Messrs. Mayfield	T. B. Thompson, Architect, 15, Parliament-street, Hull.
"	Ilkeston, Derbyshire—Schools, Regent-street	Rev. J. P. McCarthy	J. Hart, Architect, Corby, Grantham.
"	School, near Tadcaster	Kippax School Board	Bromet and Thorman, Architects, Tadcaster.
"	Exmouth—Two Shops, Exeter-road	F. W. P. Orchard	Kerley and Ellis, Architects, Exmouth.
"	Peterborough—Seven Houses, Farcot	New Peterborough Brick Co., Ltd.	F. H. Cooke, Surveyor, Peterborough.
"	Whitley, Northumberland—Eight Houses		A. Stockwell, Architect, 11, Pilgrim-st., Newcastle-on-Tyne.
"	Peterborough—Entrance to Agricultural Show		J. G. Stellebrasse, Architect, North-street.
"	Kilkenny—Additions to Royal Oak Inn, Upper John-st.		Jas. Byrne, C.E., Carlow.
"	Edinburgh—Villa, Colinton		E. C. H. Maidman, Architect, 13, South Charlotte-street, Edinburgh.
"	St. Clement, Norfolk—Church Works, Terrington		Hicks and Charlewood, Architects, 42, Grainger-street, Newcastle-on-Tyne.
"	Bracebridge, near Lincoln—Additions to Asylum		F. H. Goddard, Architect, Lincoln.
"	Burnley—Two Houses, Scott Park-road		Geo. Farrer, Nicholas-street, Burnley.
"	Cheshunt—Three Villas		Jas. Bunce, Turner's Hill, Cheshunt.
"	Denaby Main—Church, St. Albans, and Presbytery		Empsall and Clarkson, Architects, 7, Exchange, Bradford.
"	Ashton-under-Lyne—House, Grafton-street		T. George and Son, Architects, Old-square, Ashton.
"	Ashton-under-Lyne—Spinning Sheds, Oxford Mills		T. D. Lindley, Architect, Ashton.
<b>ENGINEERING—</b>			
June 11	Blackburn—Engineering and Shed Works	Guardians	J. Aspinall, Architect, Victoria-street, Blackburn.
" 12	Haslingden—Tanks, &c.	Sewerage Board	H. L. Hinnell, 41, Corporation-street, Manchester.
" 14	Clitheroe, Lancs.—Filter-bed	Corporation	Office, Borough Engineer, Clitheroe.
" 14	Dublin—Timber Jetties	Public Works	Office of Public Works, Dublin.
" 15	Wallasey, Cheshire—River Wall, &c.	Urban District Council	T. Moulding, Public Offices, Egremont.
" 16	Southampton—Boilers, &c.	Corporation	Municipal Offices, Southampton.
" 17	Madrid—Dredging, &c.	Spanish Government	Ministry of Public Works, Madrid.
" 21	London, E.—Graving Dock, &c.	Proprietors	W. Jaffery, 3, Victoria-street, Westminster.
" 21	Queenstown—Waterworks	Town Commissioners	Town Commissioners' Office, Town Hall, Queenstown.
" 22	Wootton Bassett—Railway (3½ miles in length)	Great Western Railway	Office, Engineer, Paddington Station, London.
No date.	Thrapston—Two Brick Culverts	Rural District Council	G. Siddons, Surveyor, Thrapston.
"	Thornbury, Glos.—Pipe-laying (1120 yards)	Gas Company	S. Fudge, Secretary, Gas Offices.
<b>IRON AND STEEL—</b>			
June 14	London, N.—Street Lanterns (100), &c.	Hornsey Urban District Council	E. J. Lovegrove, Council Offices, Southwood-lane, Highgate.
" 14	Warrington—Ironwork, Roofing, &c.	Sanitary Works Committee	J. Deas, Bank House, Sankey-street, Warrington.
" 15	Salisbury—Roof (70ft. span and 50ft. long)	Gas Company	N. H. Humphrys, Gasworks, Salisbury.
July 1	Kettering—Sewage Disposal Ironwork	Urban District Council	T. R. Smith, Engineer, Market-hill, Kettering.
"	Uitenhage, Cape Colony—Pipes	Corporation	Library of the Institution of Civil Engineers, Great George-street, London.
<b>PAINTING—</b>			
June 11	Ashford, near Staines—Painting District School	West London School District	Superintendent at School, Ashford.
" 12	Colchester—Barracks, &c.	War Department	R.E. Office, Colchester.
" 14	Cockfield, Durham—Painting, &c., Chapel		W. Dunning, 16, Burnt-houses, Cockfield.

" 23	Friern Barnet—Kerbing, Channelling, &c.	Park Estate	R. J. Thomson, 64, Hill-road, Wimbledon.
" 23	North Walsham—Granite	Urban District Council	E. J. Reynolds, Beaconsfield-road, Friern Barnet.
" 24	Eccles, Lancs.—Materials, Flag Rock Kerbing, &c.	Urban District Council	Surveyor, Council Offices, North Walsham.
" 25	Walthamstow—Making-up and Laying Concrete Flags	Highway Committee	Office, Borough Engineer, Town Hall, Eccles.
<b>SANITARY—</b>			
June 14	Wibsey, near Bradford—Sewers, &c.	North Bierley Urban District Council	P. Ross, Council Offices, Wibsey.
" 18	Chatburn, Clitheroe—Removal of Refuse	Rural District Council	Office, J. Eastham, Clerk, Clitheroe.
" 19	Holyhead—Sewerage Works	Urban District Council	J. L. Griffith, Stanley House, Holyhead.
" 21	Hendon—Sewerage Works	Urban District Council	S. S. Grimley, Offices, The Burroughs, Hendon, N.W.
" 23	Croydon—New Surface-water Drain	Rural District Council	J. Wilson, 49, London-road, Croydon.
" 21	Sandgate—Public Convenience	Urban District Council	A. R. Bowles, Surveyor's Office, Sandgate.
" 24	Eccles, Lancs.—Sewers	Highways Committee	Office, Borough Engineer, Town Hall, Eccles.
" 29	Brownhills, Staffs.—Sewerage Works	Urban District Council	H. B. Nicholls, 59, Corporation-street, Birmingham.

## COMPETITIONS.

DATE DESIGNS TO BE SENT IN.	DESIGNS REQUIRED.	AMOUNT OF PREMIUM.	BY WHOM ADVERTISED.
June 14	Shaw, Lancs.—Plans for Sunday School		Rev. F. W. Nicholson, 10, Refuge-street, Shaw.
" 16	Morecambe—Designs for Hotel	£100, £50, £25, £15	Baxter and Abbott, Back-crescent, Morecambe.
" 21	Rugby—Plans for Municipal Buildings	30, 20 guineas	Urban District Council.
" 24	Gloucester—Plans for proposed Infectious Diseases Hospital	£100, £50, £30	Corporation.
" 29	West Hartlepool—Designs, &c., for Laying out Pleasure Grounds		Corporation.
July 1	Elne, France—Water Supply Scheme		La Marie, Elne, Pyrénées Orientales.
" 20	Howth—Presbyterian Church	£20 (merged £10)	Rev. J. Wilson, 4, Rhoda-villas, Howth, Co. Dublin.
" 31	Booth—Designs for Technical School	50, 30, 20 guineas	Corporation.
1898			
Jan. 30	Carlton, Victoria—Children's Hospital	£100, £50, £25...	Hospital Governors, Pelham-street, Carlton, Australia.

### Architecture at the Paris Salon. By our Special Correspondent.

THE Architectural Exhibition at the Salon strikes one at once as being so entirely different, both in aim and achievement, to that at the Royal Academy. It would seem that no attempt is made to give anything approaching a record of the year's work in building, as seems to be the idea at the Academy. Architecture appears to be valued at the Salon for its artistic or archaeological qualities. It is free from the tyranny of the eminent practitioner. Common-place designs by important personages, drawn by others less important but more artistic, do not constitute the principal thing here. The chief feature of the designs is the great importance attached to the plan, and their reasonableness and sublime common-sense, and in the drawings—as draughtsmanship—the extraordinary facility and power with which they are presented. Here one seems to breathe a clear, intellectual atmosphere; cold, perhaps—too cold for emotionalism—but bracing to the healthy nature. What is perhaps most interesting to the foreigner out of touch with the feeling of contemporary French Design is the large number of beautiful drawings of old work. Such is the set of about twenty coloured drawings of the Early Christian decoration of a Church at Mistra, in Greece, by Mons. L. Yperman, giving the present condition of the paintings; or the drawings of an elaborately modelled and painted ceiling, by Mons. Eustache; or, again, the drawings of some marble mosaic decoration at St. Mark's, Venice, or the elevational drawing of the façade of St. Giles, Provence. These are all done with a command of the colours and the brush that is simply amazing. There is little of the pen-and-ink work with which we are familiar, everything being represented by colour; and here we think they are right. The brush does not so easily lend itself to tricky effects as does the pen; it insists on a knowledge of colour values, and tends to a broader and more dignified treatment. The Restoration drawings this year include a large and elaborate set of the ruins at Pergamos. There are first plan and elevational coloured drawings of the ruins in their existing condition, with water-colour sketches from different points of view, and then another coloured set giving the conjectural restoration of the buildings with details of certain parts. There is value in this sort of work. It is thorough and comprehensive. It aims at an understanding of the work of the past and contrasts forcibly with the scrappy sketches of picturesque odds and ends in which the English student so delights. There is, perhaps, from our point of view, a danger in this—a tendency to overdo all this sort of thing—to exalt Draughtsmanship and Archæology above Design; to know so much, and have so keen an appreciation of the works of the past, that they become sufficient for us, and there is no desire to create anything new. But, for all that, we cannot but feel grateful to the care and patience which has placed so much valuable work at the service of the student. The original designs, being by Frenchmen, are naturally French in sentiment, and, when we have said that, we have said enough, and perhaps too much, for some people. There are very few to our taste, but possibly they are none the worse for that. Frankly, we do not

much like them, but, all the same, we feel that we ought to—we have a sort of suspicion that it would be better for us if we did; and we cannot but envy their high standard of technical skill. Works that compel an unwilling admiration, in the teeth of our prejudices and insular tastes, must have something in them. We borrow our sentiment from no one; but to see difficulties which we have ourselves to confront overcome in such a masterly way is of the greatest assistance. Taking the Exhibition as a whole, there would appear to be a very high standard of knowledge and skill, but a dearth of ideas. Though it may seem a paradox, this is, perhaps, its strong point, and a proof of the artistic insight of the French nation. Original ideas are scarce, very scarce; at certain epochs there are none. It

**Art in the East End.** THE East End will soon supplement its meagre virtues by a claim to the artistic. At last, the proposed Art Gallery, which has been a subject of agitation for over seventeen years, is within measurable distance of becoming a realised fact; and the realisation of a scheme of such obvious utility is surely a matter for general satisfaction. Mr. Passmore Edwards having undertaken to build a permanent gallery in Whitechapel, and the remaining £15,000 necessary to the carrying out of the scheme being forthcoming, Canon Barnett will, no doubt, be able to complete the purchase of the site this month. The possible criticism, that an Art Gallery in the East End would meet with little or no appreciation among

SAN MARIA MAGGIORE, ROME. WATER-COLOUR SKETCH BY A. N. PRENTICE.

is but a weariness of the spirit to dish up the old ones over and over again, or to wrench from literature those appropriate to that Art, and to try and present them in the plastic Arts, as we see at the Academy. The French seem, at present, to confine their energies to keeping up a high standard of criticism and technical skill, a fertile soil for new ideas, an exhilarating atmosphere for men of original genius when it shall please the Fates to send them. Certainly there is much at the Salon which calls for attention, and much which, despite what seems to us to be oddities of style and sentiment, calls for admiration, though, as we have said, our admiration is often checked by a certain laxity of feeling. It cannot be doubted that there are always some good points to be noted by an inspection of the work of our French neighbours.

the ranks of those for whose benefit the institution is sought to be established, is at once disarmed by the amazing popularity of the picture exhibitions periodically held at Whitechapel; it has, in fact, been clearly demonstrated that even in the uncongenial atmosphere of such an unpromising quarter as the dismal East End, the love of Art is not completely choked, and that a section of the community, at any rate, can raise itself above the prevailing sordidness and squalor into the ethereal serenity of Art. In a word, Art is every whit as much appreciated in Whitechapel as in Regent Street, and the hollowness of the theory which was cherished half a century ago, that only the comfortable classes can afford to appreciate Art, has now been fully exposed. Why, then, should all, or nearly all, the picture galleries of London

be centred in one quarter? If Art is needed at all, it is needed in the East End—in the East End where the toiler moves daily through a wilderness of grim and grimy bricks, innocent of the many beauties of the country-side, or the charms of the thousand and one objects which engage the painter's brush. To the end they would preserve their innocence were not the painter and the Artist to come to their assistance. Even with the new gallery, which it is hoped will soon rear its head against its old and begrimed neighbours like a star on the artistic horizon, it would of course be impossible to obtain a continual sequence of loan collections the year round. It is suggested, however, that in the course of the year at least two first-class Exhibitions, with frequent loan exhibitions from South Kensington, might be held. And the latter proposal is certainly much to be commended, inasmuch as it would aid in the circulation of the Art treasures, which, the latest report on the subject informs us, are in imminent danger of destruction by fire at South Kensington. Anyway, the necessity of—not one, but several—Art Galleries in the East End is a plain truth, and the sooner the need is supplied the better.

#### YORKSHIRE CHURCHES.

THE East Riding Antiquarian Society has just opened another season with a successful excursion to the Wold district embracing North Newbald, Sancton, and North Cave. The first halt was at North Newbald, which, as rightly observed by a Hull historian, possesses the finest among the many fine parochial edifices in the East Riding built in the Anglo-Norman period. Some architectural critics look upon the fabric as one of the most perfect Anglo-Norman country churches in the kingdom, and it is well-known that the late Archbishop Thomson termed it his Norman Cathedral. Mr. F. S. Brodrick, Architect, of Hull, who accompanied the members of the society in their tour, puts the date of the foundation of the Church at about 1140. The Norman chancel, which was of the same date as the nave, and had probably a circular apse, has been pulled down, and the existing chancel, of fifteenth century work, built. Originally there were at the east end of the transepts two chapels, which also had circular apses. There are no less than four beautiful Norman doors, the most beautiful being the one at the west entrance on the south side. Above it, almost in a vesica, is a statue, which is surrounded by

#### CHEVRON AND OTHER MOULDINGS.

It has been supposed that the figure represents St. Nicholas, to whom the Church is dedicated, but Mr. Brodrick thinks that this supposition can hardly be correct, as none of the emblems of the patron saint are shown. As stated in Murray, it is more likely to be a figure of Our Lord in His Majesty, the right hand being raised in dispensing grace, and the left hand holding a volume or book dispensing knowledge. Against this theory, however, was the fact, says Mr. Brodrick, that there is no nimbus, but this may have been destroyed. Attention was directed to the triplet window which has been inserted in the south transept, the date being about 1220, and to the corbel table, in which are some very interesting figures carved in the Norman period. Inside the Church there is an extremely handsome font of the Early English period, with clustered columns and stiff ornamental foliage round the bowl. It is in its original state. The massive tower rests on four semi-circular arches which have bold chevron mouldings resting on columns with bold capitals. Of the monuments, perhaps, the most interesting is the tablet on the north wall of the chancel to the memory of Sir Philip Monckton, Bart. Sancton, about two miles from North Newbald, was next visited. The chief feature of the Church is a fine octagonal tower in the Perpendicular style of Architecture. The village is pleasantly situated in a deep valley, and although in itself containing

little of special interest, its surroundings have, to quote Mr. J. G. Hall, proved a prolific source of antiquarian and archaeological research, as almost every field in and around the parish

#### IS RICH IN RELICS

of the Britons, Romans, and Saxons. The food jar of the ancient Briton, with his implements of flint and stone; the cinerary of the Imperial Roman, with coins of that people; the bronze arms and substantial pottery of the Anglo-Saxon, with coins of the Heptarchy, and down to the time of Elizabeth, have all been found in the neighbourhood. The Church of All Saints', North Cave, was next inspected. It is an ancient building, and a great part of the exterior is covered with ivy. The oldest part of the Church is the tower arch, the responds to which are of Norman character. Following this is the arcade, which is in the very Early English style. The fabric, according to the explanation of Mr. Brodrick, was originally, no doubt, an aisleless Norman Church. The aisles were added in Early Decorated times, about 1320, the windows being examples of the simplest yet graceful form of tracery. The windows on the north side are smaller than those on the south side. The chancel arch is of similar date to other work in the Church, but has apparently been rebuilt—why in such an unsightly shape people of the present day cannot imagine. The clerestory was added in Late Perpendicular times. At the same period the upper part of the tower was built, and the west window inserted. In recesses on either side of the chancel are alabaster recumbent figures to the memory of members of the Metham family, former owners of the manor.

#### HOSPITAL ACCOMMODATION IN NORWICH.

THE annual report upon the sanitary condition of Norwich, for the year 1896, has just been issued by Mr. H. Cooper Pattin, Medical Officer of Health. Dr. Pattin says: "The system of scavenging adopted by the Sanitary Committee in October, 1894, works well, and with continuously increasing efficiency. At the same time, I think it well to point out that the scavenging costs some £6000 a year, and with an increasing population is tolerably certain to cost more—albeit, I know that it is carried out with every possible economy—and I suggest for the consideration of the Council that it would prove a prudent economy to do what other towns have done (e.g., Sheffield and Leicester), pay a portion of the

#### COST OF CONVERTING 'BINS,'

&c., into water closets, looking for and finding recoupment not only in lessened scavenging charges, but in what is infinitely more important, improved healthiness in the citizens, and a heightened appreciation of the decencies of associated life. A movement which, if it do nothing more than stimulate a healthy public opinion, cannot fail to be most helpful to the Sanitary Committee, has been recently inaugurated in the city in the shape of a 'Sanitary Aid Association.' This association proposes to aid the Sanitary Authority by bringing (through a Central Committee) under its notice any insanitary conditions which its individual members may become acquainted with in Norwich; and if it succeed, as I fervently hope it may, in creating a public opinion which cannot be other than a source of strength to the Sanitary Authority in dealing with insanitary property, &c., the possibilities of its usefulness are practically unlimited. Representative clergy of all creeds have joined this newly-formed Sanitary Aid Association (doubtless feeling that it is of little use to propound the moralities until you have provided the decencies of life), as well as influential laymen; so that the representations of its Central Committee will command the respect as well as receive the prompt attention of the Sanitary Authority." Under the head of "Fever Hospital" Dr. Pattin says:— "However gratifying from our point of view the anxiety to share in the benefits conferred by the hospital may be, from another aspect it

becomes very disheartening to those responsible for the administration of the institution, and in particular to its medical superintendent; we have to

#### CAMPAIGN AGAINST INFECTIVE AILMENTS

with such inadequate forces. We ought to have beds provided in the proportion of 1 per 1000 of the population—as a matter of fact we have only one bed to every 2250 of the people—the mere statement of which fact enables the reflective to at once realise our situation. That we made the fullest use of our restricted resources is very certain; and that the hospital is so highly appreciated by the people remains a source of great satisfaction; and makes all associated with it desirous of seeing its possible usefulness afforded every possible opportunity of development. The lack of hospital accommodation was responsible for quite forty per cent. of the cases of scarlet fever which occurred during the latter part of the year; our being unable to remove the first case from a dwelling constantly led to the occurrence of more cases in the family or immediate neighbourhood." The doctor once again speaks strongly of the inadequacy of the Fever Hospital accommodation, even in non-epidemic times. "The administrative block is, in particular," he says, "altogether too small for our requirements. As matters stand at present I am obliged to use one of the wards in the central pavilion as a sleeping-room for the ward-maids and another for a discharging-room, so that one-half of the said central block cannot be used for patients at all. Now, when our severely restricted ward accommodation is considered, it will be seen that this means a wasteful and altogether

#### UNDESIRABLE STATE OF AFFAIRS,

and one which, in the interests of economical administration, should be promptly remedied. Even if no additional ward accommodation were provided, the suitable enlargement of the administration block, and the provision of a properly arranged discharging ward would enable us to treat a dozen additional patients. But to meet the requirements of the city, the population of which it should be remembered increases at the rate of more than 1000 a year, I am of opinion that (a) an enlargement on the ground floor of the administrative block, with additional bedrooms on the first floor, and the construction of a second floor over both old and new portions (which the existing walls will easily support) so as to provide separate bedrooms for at least twelve nurses, and a large common room for the servants; (b) the erection of a porter's lodge, to which should be attached a small properly constructed 'discharging room'; (c) a new pavilion providing accommodation for twenty-four patients, with a play-ward for the convalescent children at right angles to the wards, and over the entrance, bath and duty rooms of the new pavilion (the provision of a play-room would, indeed, be a boon, particularly in wet weather); and (d) an extension and improvement of the laundry accommodation are requisite. Towns with lesser populations than that of Norwich provide much more ample accommodation, e.g., Huddersfield and Southampton, the Council of which latter borough has recently determined to spend some £30,000 in providing fever hospital accommodation."

#### IMPORTANT NOTICE.

In consequence of the difficulty in circulating the next issue of the BUILDERS' JOURNAL on the day of the Jubilee celebrations, it has been decided to publish one day earlier, so that there may be no delay in obtaining copies in the country.

A REFUGE has just been erected on the west slope of Néouvielle. It is built of stone at a height of about 7500ft., and contains a number of necessities. Keys are deposited in the hotels of the neighbourhood.

THE scheme for the erection of a municipal grain silo at the Salford Docks has collapsed. The site originally agreed upon by the Salford authorities and the Canal Company was found to be unsuitable.

## THE CONSTRUCTION OF JUBILEE STANDS.

By R. J. GIFFORD READ.

(Continued from page 1xx.)

AS an example of a stand with one tier on the ground may be mentioned that on the green facing Parliament Street, Westminster. It is on level ground, and, except that the plan of the front is octagonal, is about as simple a form as could be devised. A general cross-section of it is shown in Fig. 1, and the whole stand is a repetition of such a section with the principals placed about 6ft. apart. It will be seen that the posts stand at the intersection of two sets of 11in. by 3in. sills placed at right angles across each other, and simply resting on the grass lawn. The back posts, which are about 18ft. high, are 9in. by 9in., and the shorter ones 6in. by 6in., placed about 7ft. apart, and cross-braced both ways with 8in. by 3in. The sloping beams which support the steps are 11in. by 3in., halved into the tops of the posts, and immediately below them are 9in. by 3in. horizontal collar beams, bolted to the posts, which lend a further support to the sloping beams.

The steps supporting the seats are about 2ft. 4in. wide by 9½in. rise, formed with triangular chocks nailed to the slopes, and covered with 3in. planking. The seats consist of small stools built on the front edge of each step, and continued throughout the length of each bay. Access is gained to the stand by two staircases at the back, and two gangways are cut through the stools for access to the seats. The front portion of the stand abuts against the iron railings of the green, which are protected with a close boarded fence.

Other examples of this type are to be seen in front of the National Gallery, in front of St. Paul's, and a vast range on the south side of Constitution Hill, built for H.M. Office of Works by Messrs. Mowlem and Co. Another very large one is that occupying the churchyard to the east of St. Martin's Church. This varies in height from a few feet in front to 35ft. at the back, and carries thirty-eight rows of steps. These vary in width from 3ft. in front to 2ft. 3in. on the upper portion at back. The posts supporting it vary from 9in. by 9in. at back to 6in. by 6in. in front, cross-braced both ways by 8in. by 3in. Also, on account of the uncertainty of the foundations from vaults and graves in the churchyard, it was deemed advisable to spread the weight on each post, which was about six tons, over as wide an area as possible. This was done by putting four spurs or struts to the base of each post and butting them on to cross sills, which were packed up by planking on the pavement; by

FIG. 2.

this means the pressure was reduced from about 1½ tons to 6cwts. per square foot of bearing surface.

The stands above mentioned are of the simplest character, but there is another type of one tier stand where the conditions of the site require the stand to be set up a considerable height above the base, in order to look over some obstacle. An example of this is given in Fig. 2, which is one erected on the south side of Westminster Bridge. Here the base of the stand is situated on the wharf just above high water, and consists of a series of large trestles cross-braced both ways, and of sufficient height to raise the stand above the parapets of the bridge. The stand itself consists of triangular trusses, framed up complete and resting on the trestle work below, and is,

therefore, of a different character to those before mentioned, where the sloping beams are supported by independent props resting on the ground. It will be noticed also in Fig. 2 that the seats are formed of benches with backs to them of a very simple character, and are fixed at the back of each step, not on the front as in the previous case.

Another example of this type is that in Trafalgar Square, where the base of the structure is on the low level, and the stand had to be raised up about 12ft. in order to look over the balustrade on the high level.

Fig. 3 shows a section of a stand raised up above the wall fronting Devonshire House, Piccadilly. The strutting is cleverly arranged, and it will be noticed that the steps are carried on stools resting on longitudinal bearers or

A CROSS SECTION OF STAND

FIG. 1.

FIG. 3. AT DEVONSHIRE HOUSE, PICCADILLY.

purlins, and not on the sloping beams like those above.

An example of a stand with two tiers is shown in Fig. 4, which is one being erected at the Church of St. George the Martyr, Borough, from designs of Mr. Waring, C.E. The foundations in the graveyard being very uncertain, it was considered advisable to support the weight of the stand on large timber baulks laid crosswise on the soil. By this means not only is the weight distributed, and the pressure reduced to a minimum on the soil, but any weak spot is bridged over by the timbers, which are strong enough to support any one post should the ground give way beneath it. It will be seen that the upper tier of this stand is supported by posts front and back and by two rows of posts passing through the seats of the lower tier. The posts are braced with timber trusses both longitudinally and crosswise, and these support the sloping bearers, 11in. by 3in., placed 2ft. apart, which carry the steps for the seats. In this case, as in many others, hired chairs are placed in the steps instead of fixed benches.

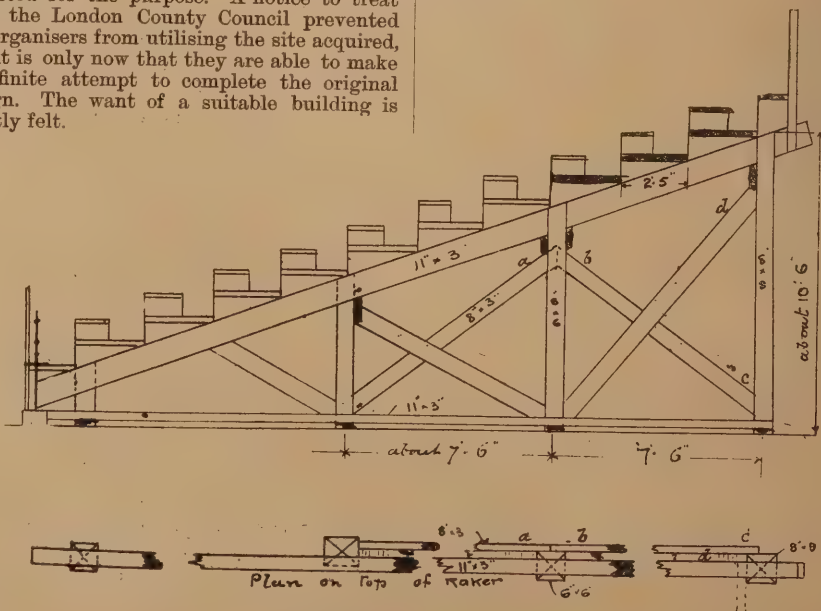

This stand is of considerable depth from back to front, accommodating fifteen rows of seats. Another, somewhat of the same character, is being erected at St. Mary's Church, Strand, but the posts are closer together, and there are no trussed girders. A stand of two tiers, but much narrower, being only of one span in width, is being erected in the front of St. George's Church, and another in the front of St. Martin's Church.

Fig. 5 shows a stand of three tiers, being erected on the south side of the same Church, designed by Mr. F. Verity, Architect. In this, the tiers of seats are carried on sloping beams, supported by a row of posts, front and back. These posts are further tied to each other and back to the wall of the Church by strong cast iron tie rods. Longitudinally, the front of each tier is carried on deep trussed girders, which also form braces between the posts.

Another very large stand of three tiers, in

course of construction, is that opposite the Horse Guards, Whitehall. In principle, it is somewhat similar to that above mentioned, but instead of backing on to a Church it has to stand by itself in the open, a strong buttressing of braced timbers being substituted for the Church. We hope to be able to illustrate this more fully when completed.

Soon after the death of the late Mr. W. H. Smith it was determined to establish in the parish of St. Clement Danes a memorial hall, suitable for a workmen's club, and £2250 was collected for the purpose. A notice to treat from the London County Council prevented the organisers from utilising the site acquired, and it is only now that they are able to make a definite attempt to complete the original design. The want of a suitable building is greatly felt.

AT THE NATIONAL GALLERY.

## SANITARY PLUMBERS' WORK AND SANITATION.\*

By S. S. HELLYER.

(Continued from page 252.)

I KNOW that some authorities still prefer stoneware drains to iron, even for fixing inside a house. I had an argument with one only last year, but "a man convinced against his will is of the same opinion still." I think it would be almost impossible to find anywhere a stoneware drain of any great length inside a house absolutely water-tight from end to end, which has been in use for, say, fifteen years. Even when every precaution has been taken, and a stoneware drain has been very carefully laid, and its joints specially made, one could not be certain how long it would remain perfect. After many years of existence there may only be

### A SLIGHT LEAKAGE IN IT,

but if that occurs inside a house it will be sufficient to create great unrest in the minds of sensitive inhabitants, even if no illness arise from it. And the misfortune in such cases is that such leakage or leakages are generally difficult to repair, and are practically impossible of repair without danger of doing further injury to the drain. I have just had a cast-iron soil drain examined which was fixed inside a house in the City twenty-six or twenty-seven years ago by my firm. The pipe is of water-main strength, and is suspended from the ceiling joists in the basement. Both the pipe and the caulked lead joints were found in excellent condition, nothing having been done to them from the time they were executed, except that in whitewashing the basement the drain had also been whitewashed from time to time. In 1881 I had some manholes built in brick and cement on the first floor of my offices as examples, together with some sanitary fittings, and a specimen length of iron drain. I had a photograph taken of certain parts before their removal last year, and you will see that the iron pipe and the caulked lead joints are quite good, and show no sign of wear, though they were experimented with for fifteen years. Also you will see from the same photograph, that though apparently no action has taken place between the lead and the Portland cement, which connected a piece of lead soil-pipe to the stoneware drain, the cement joint shows that there was no real adhesion of the cement to the glaze of the stoneware socket, and this accounts for the leakage which quickly showed

\* A paper read at the Architectural Association on the 21st May.

FIG. 4.

itself when tested with water. Notwithstanding that many authorities require that even

#### CAST-IRON DRAINS SHOULD BE EMBEDDED IN CONCRETE,

I consider such treatment a wicked waste of money, for with a pipe of proper strength all the support it needs is from its under-side, except in very exceptional cases, and this is best done by brick piers built on concrete bases, with a stone or concrete resting-slab for the pipe to nicely fit in, or by making a continuous bed for the drain in Portland cement concrete. This arrangement readily admits of the removal of the earth surrounding the drains and the joints, for any future examination of the pipe, and for recaulking of the joints when necessary. When such drains are encased in concrete the cost of cutting away the concrete to find out a leakage or to get at the joints would lead to great expense and do damage to the drain. Where practicable, instead of laying an iron drain in the ground, where it is inside a house, it is better that it should be carried on the face of some wall, or be suspended from a floor, or be carried in a subway, or have a tunnel or creeping trench specially built for it, in brick and cement, with openings into it only from the external air, so that the drain may be readily examined, and in the latter case be completely isolated from the house. The many improvements in sanitary plumbers' work which I have brought before you, or to which I have alluded, as well as many others which I have had no time even to mention, have almost entirely been made during the latter half of the long and magnificent reign of Her Majesty, whose Diamond Jubilee we are going to so gloriously celebrate next month. And when dipping my pen into the ink-bottle to write the finishing words of this paper, it occurred to me that instead of attempting any kind of peroration, the better thing to do would be to drop the pen for the pencil, and portray in a sort of transformation piece the progress of

#### PLUMBERS' WORK BETWEEN 1837 AND 1897.

Before showing this set-piece, which my draughtsman has so well got out, I should like to remind you of the great power you possess for raising and maintaining the standard of plumbers' work. Other authorities may desire it, may even expect it; but Architects, from their privileged position as advisers, and as the designers and directors of building works, can demand it, can to a large extent secure it, by providing for it in their specifications, and by being prepared to properly pay for it. And though plumbers may not everywhere throughout the country be equal to the demand for very high-class work, they will be much stimulated by the desire of Architects for such

work. At any rate, more than any other class, more even than medical men—who have so nobly and so disinterestedly done so much for the Craft, for sanitation—can the Architect aid the plumber in making our homes healthy to live in. When the hand-worker—greatly interested in his work—produces with skill and intelligence what was required of him, what was portrayed to him by the head-worker, he is ever so much helped by some appreciative acknowledgment, however slight: and a word of praise to the deserving—how good it is! Like mercy, it is twice blessed. Gentlemen, in your works may it be your privilege to make the workers happy in their work.

—Mr. F. G. H. Hooper, in proposing a vote of thanks to Mr. Hellyer, remarked that he was sure the paper would have an appreciable influence in promoting that work which the author had so much at heart. In this year of jubilation he thought sanitarians could take some credit for the longevity of the Queen. Had Her Majesty's lot in life been cast under conditions similar to those of a great many of her subjects, she would not now be approaching the eightieth anniversary of her birth. It was rather interesting to recall the fact that through the wisdom and foresight of the late Prince Consort, Her Majesty's palaces were in the early part of her reign examined by sanitary

#### ON, SOUTH SIDE ST. MARTIN'S CHURCH

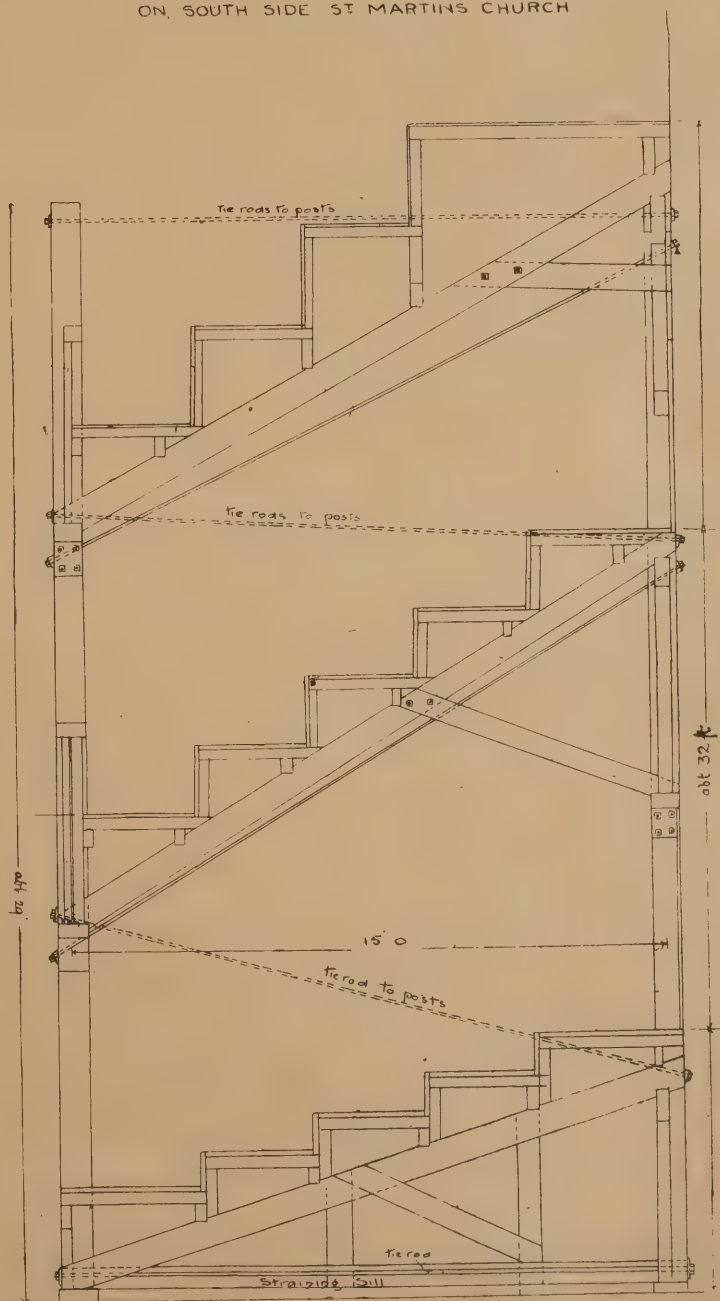

FIG. 5. THE CONSTRUCTION OF JUBILEE STANDS. BY R. J. GIFFORD READ.

experts, and rendered in that degree sanitary and wholesome, with the result they were about to commemorate. Had sanitary improvements been more generally effective, the life of the late Prince Consort might have been spared, and the Prince of Wales might have escaped his serious illness of a few years ago. The speaker proceeded to speak of the shortness of life among the industrial classes, and to express pleasure at Mr. Hellyer having brought forward the question of sanitation so prominently. He thought that the question of ventilation was not half sufficiently thought of in the construction of domestic dwellings, not only those occupied by the lower and middle classes, but also those tenanted by persons of higher rank. And one point he particularly wished to mention, and that was

#### THE VENTILATION OF STAIRCASES.

Many of the troubles so often met with in houses to-day would vanish, he thought, if staircases were properly ventilated. He hoped, therefore, that more attention would be given to this point.—Mr. G. H. Fellowes Prynne

had not previously suggested itself to the speaker, who had great pleasure in supporting the vote of thanks.—Mr. Osborne Smith remarked that he had heard it said in that room that

#### DRAINS WERE NOT ARCHITECTURE.

There was, no doubt, truth in the statement. But then there were a good many matters connected with building, and of importance to the Architect, which were not Architecture, and he thought it was unwise to deprecate a study of drainage matters to Architectural students. Architecture was the designing and the formation and the production of beautiful buildings; but buildings could not be regarded as altogether beautiful and complete and perfect unless they were healthy, and until they had paid attention to that part of the practical work of Architecture which resulted in a building being made healthy, they had not done their duty towards their client, and had not performed what they were paid 5 per cent. for. They had not rightly applied their studies if in their youthful days they had entirely disregarded the subject of sanitary

such as Mr. Hellyer had given then was worth half a dozen of the more ordinary type. Mr. Hellyer was, no doubt, in a state of delight over the Plumbers' Registration Bill, and was hoping that its second reading would be followed by its third reading, and crowned with the Royal sanction as a great national boon. A few years ago they were struck with a sense of finality in connection with sanitary science, and believed that it was coming from complex to simple—in fact, all knowledge passed from complex to simple, and the simple was not arrived at by the first effort of the mind, but by the last. After a variety of complex studies they began to see the simplest truths, and he hoped it would not be long before dense bodies in the country—local boards, with their sanitary inspectors, and also medical officers of health—would see that it was absolutely necessary for them to give some other finality and bring themselves in line—he would not say with the latest, but with the ultimate advance of sanitary science. He thought as an Association they ought to join other bodies in emphasising the necessity for a codification of sanitary bye-laws, and, for instance, bring the

FIG. 6. CONSTRUCTION OF JUBILEE STANDS. BY R. J. GIFFORD READ.

seconded the vote of thanks, remarking that the suburban house was a rich field for defective sanitation and ill-considered ventilation. There was a class springing into existence now known as Sanitary Surveyors, and it had come under his notice that a member of this class, having been intrusted with the carrying out of £1600 worth of repairs, charged his fees at the rate of 15 per cent., explaining to the client that in sanitary work it was usual to pay very much more than in "mere Architecture." Mr. Prynne referred to the sanitation in shipping, and thought some of the ocean liners, especially the smaller ships, were in a very bad state.—Mr. W. E. Bland (Newcastle) said he was sure he was expressing the feelings of sanitarians in the North when he said they thoroughly appreciated the pioneer work which Mr. Hellyer had done in matters connected with plumbing. He had raised a point in his paper which was especially interesting. He had pointed out the advisability of having the water in the basin of a valve-closet separated from the water in the trap, which seemed a very important matter, and yet a matter which

science. He quite agreed that work of this description should not go into the hands of sanitary surveyors. It came well within the province of the Architect, and he regretted that clients often had to complain of the inconvenience occasioned by an Architect's inattention to drainage matters. How often was it that one portion of a building was sacrificed for another portion which came more under the public gaze? They were certainly under a debt of gratitude to Mr. Hellyer for having read so able a paper.—The President (Mr. Beresford Pite) said that if, as had been suggested, genius was the capacity for taking pains—well, they had had a very good lesson that evening in the value of taking pains, and he thought it had come home to them in a very remarkable way that there was a blessedness and beauty in taking pains, and the way in which Mr. Hellyer had managed to inspire a feeling of security and grasp and mastery of detail had been most striking. If they wanted to learn a lesson, they should go to the very best master then could lay their hands upon. One lecture

districts around London into line, and thus find some means of penetrating the ignorance and thick-headedness so often met with with the real facts of sanitary science. Let them remember that a house was a piece of machinery, not a box with ornaments around it. It was a machine in which people had to spend their days and nights, and the Architect had to provide for them in sickness and in health, even to the last moment of life. He congratulated Mr. Hellyer on having got rid of "that abominable landscape basin," and remarked that were they

#### IN THE INTERESTS OF ART

to write their opinion of some of the patterns of closets sent them by the makers, it would possibly have more than a passing influence on the trade.—The vote of thanks was carried, and in returning thanks Mr. Hellyer said he was extremely glad to see that the Architectural Association took so much interest in the question of sanitation. It was the popular privilege of the Architect to see that a house had proper sanitation, but it was more than his privilege

—it was his duty. And they could do a great deal to aid plumbers by studying sanitation up to a certain point. But really he did not know what subjects an Architect ought to include in his training. It took him all his time to get to know a little bit about sanitation, but the Architect—well, he had to know something of *all* the trades.

#### CORPORATIONS AND INSANITARY AREAS.

THE text of the Bradford Sanitary Committee's report dealing with insanitary areas is as follows:—Your sub-committee has visited Birmingham, Liverpool, Manchester, and Salford, and has inspected insanitary areas proposed to be dealt with, and others which have been dealt with by the Corporation of each of those cities. We were informed that in Birmingham, immediately after the passing of the Artisans' and Labourers' Dwellings Act, 1875, an Improvement Committee was appointed by the Corporation, with instructions to receive official representations under the Act from the Medical Officer of Health concerning the unhealthiness of any area, and to prepare for approval draft schemes of improvement. In accordance with this arrangement a large improvement scheme was ultimately adopted. About 45 acres of land in the centre of the town were purchased, and 1200 houses upon it demolished. The report of the Medical Officer shows that the death-rate of this district fell from 26 per thousand in 1885 to 19.3 per thousand in 1893, shortly after the demolition had been effected. Blocks of houses for artisans have been built on the cleared area. Since the completion of this scheme other sanitary improvements, though on a much smaller scale, have been carried out. At the time of our visit we found that the Corporation was engaged in dealing with another insanitary area of considerable magnitude, under the provisions of the Housing of the Working Classes Act, 1890. In Liverpool the Corporation have appointed an Insanitary Property and Artisans' Dwellings Committee to clear insanitary areas. This Corporation has power, under by-laws, to purchase insanitary property, without compensation for forced sale, and to erect dwellings. Presentments are from time to time made by the Medical Officer of Health to this committee under the provisions of the Liverpool Sanitary Amendment Act, 1864, and a Local Improvement Act obtained in 1882. The money required is raised by loan. Insanitary areas of large size have during the past twenty years been dealt with, and further demolition of insanitary property is contemplated. The Housing of the Working Classes Act, 1890, is not used in Liverpool. Clearance of insanitary areas in Manchester is effected under a local Act of Parliament, in accordance with which representations are made to the Sanitary Committee by the Medical Officer of Health. In the event of the committee proclaiming any district an insanitary area, the Corporation have power conferred by their local Act to purchase cottage property for demolition at the rate of £15 per house, the land upon which the houses are situate being still the property of the original owner. The chairman of the committee informed us that this Act worked satisfactorily in regard both to the interests of the Corporation and of property-owners, and that it was not their intention to apply the provisions of the Housing of the Working Classes Act, 1890, to the clearance of insanitary areas in that city.

#### THE PROVISION OF ARTISANS' DWELLINGS.

In consequence of the lack of private enterprise to provide suitable dwellings for the population displaced by their improvement scheme, the Birmingham Corporation sanctioned the erection of twenty-two cottages at an estimated cost of £4000. These dwellings were at once let to respectable tenants at 5s. 6d. per week. Subsequently eighty-two additional artisans' dwellings, at a cost of about £14,000, were erected; these houses were similar to those previously built, their

accommodation consisting of a front living-room, 13ft. by 12ft. 6in.; kitchen, 12ft. by 9ft. 6in.; front bedroom, first floor, 13ft. by 12ft. 6in.; back room, 12ft. by 9ft.; and attic, 13ft. by 13ft.; a separate w.c. being provided for each family. There is an asphalted or concreted yard common to each block, and washhouses in proportion to the number of dwellings. These houses are let at 5s. 6d. per week. Speaking of this property, the Medical Officer of Health for Birmingham says: "The houses are always in great demand, but I think they are too large and too expensive to meet the needs of the very poor." In Liverpool we found that provision for the housing of the working classes had been made by the Corporation directly by the erection of block dwellings, and indirectly by selling land which came into their possession to builders for the erection thereon of

#### SMALL SELF-CONTAINED COTTAGES,

of which 627 had been erected since 1889. We visited two large blocks of dwellings erected by the Corporation, viz., the Victoria Dwellings, which were opened in 1885, and the Juvenal Dwellings, opened in 1890. The whole accommodation thus provided consists of 371 dwellings, of which 66 are single rooms, letting at 2s. to 2s. 9d. per week; 217 are of two rooms, letting at from 3s. 9d. to 5s. 6d. per week; and 88 are of three rooms, letting at 5s. to 5s. 6d. per week. Gas is included in the rents of some of them, but is usually supplied by a penny-in-the-slot meter. The average yearly income obtained during the past ten years from the Victoria Dwellings amounts to £2 11s. 6d. per cent. upon the cost, the average for five years obtained from the Juvenal Buildings is equal to £3 8s. 2d. per cent. upon the cost. The indirect method of providing houses for the working classes, viz., by selling vacant sites to builders upon condition of their being used for the erection of small houses, was not considered by the Corporation to be entirely satisfactory, the houses erected being let at rentals too high for poor persons to pay. The Insanitary Property and Artisans' Dwellings Committee therefore recommend the Corporation to retain some sites in their own hands, when they shall in future become vacant, and erect thereon suitable tenement dwellings or cottages to produce such low rentals as will give a fair return upon the cost of the buildings and value of the land, and provide a sinking fund for the repayment of the moneys borrowed. The Liverpool Corporation now propose to erect labourers' dwellings under the provisions of Part 3 of the Housing of the Working Classes Act, 1890. In Manchester housing for the working classes has been provided by the

#### ERECTION OF BLOCK DWELLINGS,

containing 419 tenements, very similar to those in Liverpool, although not built on quite the same plan. The Oldham Road dwellings consist in the main of two-room tenements, let at 3s. 6d. to 5s. weekly; a few single rooms at 2s. to 2s. 6d. per week. These dwellings have been erected under the powers conferred by the Labouring Classes Lodging Houses Act, 1851, the Labouring Classes Dwelling Houses Acts, 1866 and 1869, and the Housing of the Working Classes Act, 1885, which Acts were adopted by the Manchester Corporation in 1889. In Salford we inspected a block of artisans' dwellings, which had been erected by the Corporation for housing some of the population displaced by an improvement scheme carried out under the Housing of the Working Classes Act, 1890. This block we considered to be an improvement on those we had already seen in that it was only three stories in height, and therefore did not lead to so large an accumulation of population on a limited area as those consisting of five stories. The rent charged was 4s. 9d. per week for a tenement of two rooms. The arrangement of the out-offices met with our especial approval. The total cost of the block amounted to £10,953, or an average of £65 per house, exclusive of land.

#### RECOMMENDATIONS.

Whilst admitting that a large amount of good sanitary work has been accomplished by dealing with insanitary districts in the past,

we think that as Bradford increases in size and population other areas become insanitary and require vigilant attention in order to keep the town in a healthy condition. There are three districts which at the present time we consider are urgently in need of improvement, viz., Longlands Street and Longcroft Place, the district of Wapping, and many of the streets on the south side of Leeds Road. We recommend the Council to deal with the above three districts under the provisions contained in Part 2 of the Housing of the Working Classes Act, 1890.

#### THE PROPER POSITION FOR THE CHOIR AND ORGAN IN CHURCHES.\*

WRITING on the above subject, Mr. F. J. Cestr says:—

As is well known, the dominant fashion is to place organ and choir at the east end, even in small district churches, and to do this as a matter of course with little or no discrimination, forgetting that—to quote Sir John Stainer—"it is most difficult to lay down any general law as to the proper position of organs in churches, because so much must depend upon (a) the shape and ground plan of the church, (b) its size, (c) its acoustical properties, and (d) the character of its services." That both the importance and many-sidedness of the question have been already recognised will be seen if I can be permitted to quote rather copiously from a valuable document, for the use of which I am indebted to Sir Walter Parratt's kindness. Some years ago he served on a committee, jointly nominated by the Royal Institute of British Architects and by the College of Organists, to consider musical requirements and arrangements in churches. Unfortunately, their report did not reach the final stage, and was therefore lost to the public; but I learn that there was substantial agreement upon the principles and recommendations contained in the draft report, from which the following extracts are taken. I cannot but think that, if this draft could be placed at the disposal of the York Committee, their work would be much more than half done, and done under particularly advantageous conditions:

After a careful review of the arrangements which are now usually made for the accommodation of the choir and organ, the committee desire to record the following observations:—

(a) That the arrangements are generally defective.

(b) That there is much misconception as to the best positions for the choir and organ in their relation to each other and the congregation.

(c) That the space allowed for the modern organ is often insufficient.

(d) That on musical grounds the old position at the west end for both organ and choir is, in general, the best.

(e) That although for ritual purposes (following the ancient English Cathedral and Collegiate arrangements) a vested choir is placed in the chancel, yet, that where there is a chancel arch, central lantern, or transepts, the sound becomes intercepted instead of passing into the body of the Church; moreover, where the chancel is narrow, antiphonal singing cannot produce its proper effects.

(f) That when the placing of the choir in the chancel (according to recent custom) has involved the removal of the organ also, it has usually resulted in cramping the organ within some confined space, or "chamber," by which the tone has been damaged, and its beautiful qualities and real efficiency impaired.

(g) That the arrangement alluded to above is not the most advantageous for the support and encouragement of congregational singing.

(h) That these defects are more or less the result of adapting new customs and requirements to old buildings, and are not always to be avoided.

(i) That, as a result of the general improvement in knowledge and taste, the increased facilities for the musical rendering of the

\* Extracts from a letter appearing in the "Times."

services, and the more frequent bringing together of large bodies of singers and instrumentalists, the provision of better accommodation for them is a problem which must be considered.

#### AS TO NEW CHURCHES.

The main object of this committee is to promote the improvement and development of the arrangements of new churches, and they have taken as their basis the musical requirements of a large town church; these requirements would necessarily be modified for small town or country churches. There would appear to be but five positions in which the choir can be conveniently placed in a church:—

1. At the west end of the nave.

It is commonly admitted by musicians that the most effective position for the organ is at the west end; but this position is not always advisable if the choir be retained in the chancel.

2. In galleries facing each other in the nave.

The advantages claimed for seating the choir in galleries (similar to the ancient "minstrel galleries") on the north and south sides of the nave are as follows:—(a) The better support of congregational singing; and (b) the opportunities afforded for antiphonal effects. [All "galleries" are subject to special conditions.]

3. Immediately outside the chancel screens.

4. In the chancel aisles.

5. In the chancel.

With regard to these latter positions, it is advisable, in planning a new building, in order to obtain the openness and space requisite for the sound to reach all parts of the building, that a "chancel arch" should be avoided, and the choir thus placed under the same roof as the congregation. This will enable the clergy as well as the choir to be properly heard.

In churches exceeding 150ft. in internal length, the plan of placing the main choir at the west end, and a "ritual choir" in the chancel may be adopted.

#### AS TO EXISTING MODERN AND ANCIENT CHURCHES.

In dealing with existing churches, whether ancient or modern, the principles set forth in the "Recommendations" should, as far as possible, be observed; but each case should be individually considered. In those places, for example, where there remain a western organ and gallery of interest, at a distance of not more than 50ft. from the choir seats in the chancel, it is desirable that such should be retained *in situ* and used; and where the distance is more than 50ft., a small additional eastern organ to support the choir is recommended.

#### RECOMMENDATIONS.

No. 8.—That the term "organ place" be adopted, because it is more comprehensive (including gallery, &c.), and because the term "organ chamber" is misleading, inasmuch as a chamber (or enclosed place) has been determined to be not suitable for an organ.

No. 13.—That the organ should never be placed between the choir and congregation.

No. 14.—That the sound of the organ should not have to pass over one-half of the choir to reach the other.

No. 15.—That when possible the organ should be equi-distant from both halves of the choir.

No. 16.—That the choir be placed on raised floors, or in low projecting galleries architecturally treated.

That Sir Walter Parratt is still of the same mind is shown in recent letters from which I am allowed to quote. Thus, he writes:—"Personally, I favour the west-end position for the organ, and I should place the choir halfway up the nave on each side. Many churches have narrow chancels, from which neither organ nor voices can be heard, and the congregation finds itself without encouragement to sing, and without support and control if it makes the attempt. I am, of course, well aware that considerations of space and ritual make the removal of the choir difficult, and even distasteful to many people. But I am convinced that in many churches congregational singing is ruined by the present arrangement." It is noteworthy that both Sir John Stainer and Sir Walter

Parratt look forward to a time when Architects will be less conservative, and have the courage to adopt more suitable arrangements for musical purposes. They both think that "the experience of our modern wants shows the superiority of the Greek cross as a ground plan." Sir John remarks that "music is not the only thing which would gain by a fundamental change in our ideas of 'propriety' and 'respectability' in church plans."

I wish I could give extracts from other weighty and independent opinions, all much to the same effect.

#### SAW AND CUTTER SHARPENING MACHINES.

By J. L. CRATHORNE.

IN these days of keen competition anything which tends to reduce the cost of production, or improves the quality of the output, must of necessity be of the highest importance. Although of comparatively modern origin, the use of emery wheels and discs, as applied to the sharpening of saws and cutting irons, is undoubtedly superior to the old-fashioned plan of filing. Not very many years ago there was a strong prejudice against emery when used for these purposes, probably arising from the wheels not being suited to the work. Now, however, they may be obtained in a variety of shapes and sizes, and of varying hardness, according to the use to which they are to be put. The advantages of these wheels when properly used are obvious, the work turned out being much greater and of better quality than when files are employed. Take the case of saw sharpening. Using a hand-file, the angles of the teeth often vary considerably, the depths of gullets are unequal, and sometimes teeth of different length result, thus giving an unequal amount of work to each when cutting. Then there is the total saving in files. In saw-sharpening machines of the most approved type the emery wheels are mounted on steel spindles running in centres, a separate spindle being usually employed for each wheel to save time when changing. The spindle is mounted in a swinging frame counter-balanced by a weight, and pivots on centres. It is pulled down to the work by handles at the end of the frame, and works in a quadrant, being fixed at any required angle by thumb-screws.

#### THE MAIN FRAMING

of the machine should preferably be cast in one piece of box pattern. An arrangement may also be fitted to regulate the depth of gullet and pitch of teeth. When a frame or mill saw is being sharpened, it is clamped in a vice attached to the machine, and can be moved laterally and transversely by means of a rack and pinion or screw. If a circular saw is to be sharpened, it is mounted on a pin attached to a vertical vice or cramp, which is adjustable vertically according to the diameter of the saw. For frame or mill saws a vice with long jaws is provided. Where a great number of saws have to be sharpened, the machine can be arranged to bring the teeth under the operation of the wheel in succession automatically. As the emery wheel has to be driven at a high speed, a counter-shaft is necessary. This is usually placed at the back of the machine. A narrow, endless belt passing over two idler pulleys and a pulley on the counter-shaft drives the wheel spindle. A moderately soft wheel should be used for saw sharpening, being less liable to heat the saw teeth and render them crumbly on the edge than one of a hard composition. Soft wheels also cut more quickly, and do not glaze so rapidly. Care should be taken to use light pressure when bringing the wheel down on the teeth, otherwise they will be rendered blue or even red-hot. A guard should always be fitted over the emery wheel in case of the latter flying to pieces. Many serious accidents have resulted from this precaution being neglected. The causes which lead to a wheel flying may be summarised as follows:—

1. Running wheel too fast.
2. Too tight a fit on spindle, causing cracks at hole when expanded by heat.

3. Being pinched too tightly between side washers.
4. A blow, wheel warped, unsound, or out of balance.
5. Wheel heated owing to work being forced too hard.

The proper speed of the wheels lies between 4500ft. and 5500ft. per minute at the periphery, according to the use to which they are put. A good speed for wheels of the sizes usually employed for saw sharpening lies midway between these two figures—say 4000ft. per minute on the edge of wheel. In mounting the wheel large washers—say one-third the diameter of the disc—should be used, the inside faces being turned very slightly concave, and a thin piece of rubber or leather inserted between each washer and the wheel. Moderate pressure should be used in tightening up the washers, and should be applied evenly. The bore of the wheel should be an easy fit on the spindle to allow for

#### EXPANSION FROM HEAT.

All wheels should be carefully examined, and if any flaws or cracks are discovered, however slight, the wheel should be discarded. Warped discs also must not be used. The spindle should revolve without vibration in its bearings, which latter should be kept well supplied with oil. For saw sharpening, discs of about 12in. diameter by  $\frac{1}{2}$ in. to  $\frac{3}{4}$ in. thick are generally used, and for deep gulleting should be of fairly coarse grit, whilst for topping and finishing the teeth, fine grit wheels are used. If the wheel becomes glazed on the face it must be dressed to present a fresh cutting surface, and for this purpose, especially with the larger wheels, a diamond pointed tool is perhaps the most suitable. A little tool for the same purpose is on the market, consisting of little star-shaped pieces of steel on a small spindle, which is free to revolve in bearings at the end of the holder. These are held in contact with the revolving emery wheel, and, chipping minute pieces out, expose a fresh surface. A simpler form of dresser may be made from a piece of thin sheet iron, which, if held to vibrate against the face of the wheel, will soon remove the glaze. If an emery-wheel has been employed on greasy work it may be cleaned with kerosine. Turning to emery wheels, as applied to plane and moulding iron grinding, two types of machine are used. One, in which wheels of various widths and profiles are mounted on a spindle running in suitable bearings, and having a rest for the tools along one side. This arrangement is used for moulding irons and narrow plane irons. The second machine consists of a hollow emery-drum with one solid end through which a spindle protrudes, the drum being held firmly against a collar on this spindle by means of a nut and washer. The plane iron to be sharpened is held in an angling rest and is moved automatically across the end of the emery-drum by a screw or rack spinion. The fence being adjustable, the irons can be ground to any angle, according to the nature of the wood they have to cut. With this machine it is possible to grind cutters of any length with perfect accuracy, and the action of the machine being automatic, no further attention is required from the time the iron is fixed in the rest to the completion of the grinding. A pair of narrow emery wheels with rests mounted on a continuation of the main emery-drum spindle will be found a very useful adjunct for roughing out moulding irons. For cleaning up castings, polishing, and a variety of other uses, emery wheels will also be found extremely valuable, showing a great saving over hand labour.

ALTHOUGH the imports of timber have been heavier this year, the stocks at many of the large ports have met a demand sufficient to make them less than a year ago. Of some kinds of pitch pine, the stocks at Liverpool are only about one-half of what they were a year ago; and other classes of timber show corresponding reductions. Heavy imports, however, are anticipated of Baltic timbers this month.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
June 16th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

"The subject of restoration," writes Mr. Thackeray Turner, secretary of the Society for the Protection of Ancient Buildings, "is, if we may judge by the communications addressed to the Society for the Protection of Ancient Buildings upon the subject of Canterbury Cathedral, now exercising many minds, and my committee, therefore, hopes you will allow it to give a brief description of the work which has been and is being done at that Cathedral. In doing so it has no desire to criticise the professional ability of Sir Arthur Blomfield, and would only remark that however much the public may appreciate work done under his influence, it is questionable whether they are willing to lose original Mediæval work to make way for it. Upon entering the Chapter House, everything which meets the eye gives the impression of newness, with the exception of the existing flooring, which is made up of monumental slabs and plain red tiles, and this we understand is to be entirely replaced by a stone pavement. As one of our informants said: 'It is entirely like entering a brand new building.' All the Mediæval painting upon the ancient oak ceiling has been covered over by new painting in imitation of the old. The smallest fracture or other defect—in other words, the scars of time—have throughout the building been 'made good,' and then the whole has been painted in many colours. No, not quite the whole, for the back of the Prior's seat and the roundels in the canopy over, represents literally the only surface of original work which now remains to be seen. Many new Purbeck shafts, highly polished and glistening, have been introduced, and the ancient shafts have been polished up to match. We believe this to be a brief and accurate account of what has been done, and your readers will judge for themselves whether this is how they desire our ancient buildings to be treated."

ARCHÆOLOGISTS will be glad to hear that some interesting discoveries have just been made at the ancient parish Church of St. Mary the Virgin, Chatham. To facilitate the work of restoration it was found necessary to remove the porch on the south side, and this revealed portions of the original Norman structure. It is found that the present west wall is in reality part of the chancel of the old Norman Church, and in the porch taken down were the remains of an ancient structure, showing that an altar once stood near the spot. Two old Norman windows, one in the porch, and one in the staircase close by, have been laid bare, whilst a Greek slab, adorned with the figure of the goddess Euphrosyne, has been discovered, built in the masonry. It is conjectured that the latter was an importation, and was originally inserted in that position in order to preserve it. Sir Arthur Blomfield, the Architect for the restoration, has reluctantly come to the conclusion that it will not be possible to save the old Norman work found in the porch, owing to the extensive cracks and fissures existing; but the fine doorway, which manifestly belongs to a date anterior to the erection

of the present Church, will be carefully preserved.

LAUDERDALE HOUSE, which in the last century was divided and became numbers 59 and 60, Aldersgate Street, is on the point of being pulled down, to allow for the erection of buildings for a well-known ink manufacturer. After the Lauderdale family migrated from the City, the grand old mansion became the residence of a distiller, then of a draper, who split it up into two houses; but the interior fittings have never been disturbed, and the same windows, staircase, drawing-room, dining-room, and bedrooms still remain in the Diamond Jubilee year of Queen Victoria, exactly as they were in the reign of Charles II. Pepys speaks in his diary of a visit he paid to the Earl of Lauderdale in the year 1666, but Lauderdale is perhaps best remembered by the fact that the initial letter of his name formed the last one of the "Cabal" of the Restoration period.

An interesting paper was read dealing with the Coronation Stone at Westminster at the monthly meeting of the Royal Archaeological Institute of Great Britain and Ireland. Treating it purely from the archaeological point of view, Mr. James Hilton explained that there existed in early times a belief that the stone was originally taken from Palestine to Egypt, and thence to Scotland, and that its removal from that resting-place would be fraught with danger to the succession of the Scottish Kings. Geological investigations, however, showed without doubt that the stone was from Scottish quarries. At Dunstaffnage it was used in connection with ancient coronation ceremonies, but there was no very clear or distinct evidence as to when or how it found its way to Argyllshire. In 834 the stone was removed to Scone for protection, and remained there until 1296, when Edward I. brought it to Westminster, together with the ancient coronation chair and regalia.

THERE are rumours and reports as to a big scheme which would alter the railway map of London. The talk of the Stock Exchange is to the effect that the Midland Railway Company is to pay five millions sterling to buy up the Foundling Hospital and its surrounding estate. The site would provide the Midland with a station just west of Gray's Inn Road, about half-way between Holborn and St. Pancras. Of course, on the face of it, the scheme is too big for the Midland alone, but the idea is to invite the co-operation of the other great railways, so as to provide London with a general junction from which railway facilities would radiate all over its area.

ARCHÆOLOGICAL researches among the ruins of the old Abbey of Villers, in Belgium, have led to an interesting discovery consisting of five slate sheets on which most minute and complete instructions are engraved for the use of the sacristan in regulating the "clepsydra," or water clock, of the Abbey. The sheets bear the date 1270. A Belgian scientist, M. Shéridan, has now translated the instructions, and we learn therefrom that at the above-named date the day began at six o'clock in the evening, and was divided into three major parts of eight "hours" each. These three parts were sub-divided into twenty-four minor parts corresponding with the twenty-four letters of the Mediæval alphabet.

MR. WATTS'S "Time, Death, and Judgment," one of the pictures which he intends to bequeath to the nation, has been hung in St. Paul's Cathedral. It forms a most effective addition to the decoration of the building, and its presence there establishes a precedent which, it is to be hoped, will be followed in the right spirit. No worthier place than the Cathedral could be imagined for the display of such great pictorial allegories as Mr. Watts has spent his life in producing.

MR. M. H. SPIELMANN, in the course of a lengthy letter to the "Times" on the subject of the danger of fire at South Kensington Museum, says: "It is obvious that the Office of Works

is to a great extent responsible for the many wooden and otherwise unsuitable buildings that have been erected, and for the ancient tenements that have been pressed into the service of the Science and Art Department. But the whole system is to blame, and at the root of it is the exemption from the Building Act enjoyed until 1864, and still enjoyed by the Commissioners of 1851, by virtue of which the galleries rented from them to the west of the Exhibition Road are at the present moment, I believe, the only buildings of the kind in London now uncontrolled by the District Surveyor or the County Council. The result is that the Western Gallery—an upper story containing the unequalled Indian collections and leased from the Commissioners for £800 per annum—is constantly in a position of alarming danger. The museum authorities have no knowledge of, and no control over, the contents of the gallery beneath—the great corridor belonging to the Imperial Institute—which may, for all they know, contain the most inflammable materials, handled by the most reckless persons. Immediately to the north of this gallery is the large temporary wooden building of the Royal College of Music, and to the south—in direct and complete contact—the great concert-hall of the Imperial Institute. This dangerous structure is of wood throughout—floor, sides, and roof—and is probably as inflammable as the bazaar of the Rue Jean-Goujon; yet under the very floor of it are the furnaces and boilers that serve the electric light of the surrounding buildings, while through its roof pass the chimney-stacks of those same furnaces and the summer kitchen of the Imperial Institute! Apart from these boilers and furnaces are many others used for lighting, heating, and chemical requirements, not concentrated in any one safe and detached building, but sprinkled about the museum buildings proper."

A RECENT sale of old Chinese enamelled whole coloured and Nankin blue and white porcelain at Messrs. Christie's included a Nankin cylindrical vase, with bands of dragons in white on blue ground, 11in. high, 20gs.; a pair of hexagonal shaped bottles, of famille verte, enamelled, with ladies, &c., in panels, 11in. high, £27; a pair of green and gold French porcelain vases, painted with classical subjects and flowers, 17in. high, £30; and an ancient Damascus oviform pottery jar, with design composed of carnations, tulips, and conventional flowers in brilliant blue, 20in. high, 40gs. The pictures sold on Friday week by the same firm included a view of a lake, with figures and a stream in the foreground, by T. Creswick, 86gs.; and a portrait of the Marquise de Gange, in red and blue dress, by Mignard, 155gs.

THE Summer Exhibition of the Dudley Gallery Art Society at the Egyptian Hall, Piccadilly, is now open. Figure, as might be expected, is the weakest section; insecure draughtsmanship is more apparent in that than in landscape, or even than in Architecture, when would-be impressionism is adopted, and this prevails now among the unequipped. Between real impressionism, or merely rapid sketches, which may be so fresh and expressive, and the sloppiness which does duty as "impression" with those who have never learnt the grammar of Art, there is a great gulf fixed, but of this it seems as though some exhibitors at the Dudley are unaware. Still, as in most affairs, there is a minority to be considered, and of it there is some creditable work, judged, maybe, from a not very exalted standard.

ONE of the most striking street improvements effected in recent years at Bristol is the widening of the greater portion of Wine Street. For several years the necessity of setting back one side of the street was a frequent topic of discussion in the Town Council. Recently it has been acquiring premises on the Council House side of the street for widening purposes, and the result is that a very desirable improvement has already been brought about. The scheme has involved the destruction of the old Pithay, where dwellings of the

Elizabethan period, with their quaint gabled roofs, formerly stood. It was reached by an alley running from the middle of Wine Street, and the reputation of the neighbourhood in years gone by was such that no respectable citizen would venture along its tortuous courts without police protection. Taylor, in his book concerning Bristol and its environs, speaks of the Pithay as a sort of "local Seven Dials." Latterly it became more respectable, and was noted as a lodging-house quarter, the name of the locality ceasing to be a reproach as in olden times. The Corporation bought the property, and lost no time in getting rid of the tenants, some of whom had inhabited houses in the unsavoury spot for upwards of half a century. The Wine Street shops which had the Pithay for an abutment have been pulled down, rebuilt, and set back considerably, and not only has the character of the thoroughfare been immensely improved, but the danger to life and limb arising from the intermingling of pedestrians and vehicles has been greatly lessened. The top end, at the corner of Union Street, remains to be dealt with, but as it is reported that the Corporation Improvement Committee has come to terms with the owners for setting back the premises, the work is not likely to be long delayed.

THE time fixed for the completion of the Memorial Chapel at Whippingham has passed by, and the sarcophagus has now been finished. No inconsiderable part of the delay which has taken place may be ascribed to the fact of a very considerable amount of marble having been cut up in order to secure, if possible, a piece of stone absolutely without a flaw or mark, and which would be of sufficient size for a statue; but though some hundreds of pounds' worth of material was experimented upon, no piece could be found which would comply with the Royal commands upon the matter. Hence, contrary to intentions, no figure of the late Prince Henry of Battenberg will form a portion of the memorial. The chapel, now practically finished, presents a chaste and elegant appearance, the pure white of the marble and the Portland stone dado being extremely effective. The Queen has taken an active interest in the general design of the memorial, and has made several visits of inspection during its progress towards completion.

APPARENTLY the French draw some of their artistic ability from a prehistoric source. Fresh excavations in the Department of the Dordogne at the grotto of La Mouthe have revealed some remarkable drawings on the walls of the cave. They probably imitate the common animals of the period; a kind of ox, a bison, a reindeer, and two undeterminable beasts. Drawings on bones have been observed in this department before, but these mural decorations seem to be still earlier, the earliest found in France.

THE monument of the Defence of St. Quentin was recently inaugurated by President Faure. The monument is the work of M. Theunissen. There is a two-story pedestal. The upper story is narrow and supports two female figures—one, crowned with towers, representing the fortress town of St. Quentin; the other, which waves a sword, is France. On the lower and wider pedestal stand Admiral Coligny and the Mayor, Varlet de Gibercourt, who organised the defence, and round them notables, common people, and soldiers. One of the notables is made to resemble the late M. Anatole de la Forge, who resisted the Prussians behind a barricade at St. Quentin in 1870. This work of Art has been erected at the cost of £4000.

It is only this week that one begins to realise that London will, on the night of June 22nd, present a marvellously brilliant appearance. Railway stations will be illuminated, clubs will be shining centres of attraction, and banks and insurance offices will vie with each other in the splendour of their equipment. St. Paul's Cathedral will not, according to present advices, be illuminated, and the brilliancy of its dome will not outshine that of less pretentious displays alongside; that is, unless the

Home Secretary's opinion be changed by the report of the experts as to the safety of the proposed scheme of illuminations. And other churches will follow suit, being left dark and dismal when all is bright around.

MR. H. W. SETON-KARR showed at the Royal Institution conversazione a large number of very interesting prehistoric stone implements from the lost flint mines of Egypt lately discovered by him. He also, at the same time, showed a number of stone implements from the Palaeolithic City he has newly discovered in East Africa. Mr. Seton-Karr's discoveries in Egypt and in Somaliland lead him to the idea that man's original home must have been in Africa, or at least in a tropical land, where clothes were unnecessary and food plentiful to hand. The palaeoliths which he found during his last five expeditions into Somaliland are identical in form with those from France and England, thus showing the unity of race throughout the world during the Age of Stone. During one of his expeditions in East Africa, Mr. Seton-Karr came on what he regarded as the headquarters or stronghold of primeval man. Here, he thinks, the Garden of Eden may have been, and the very tools which he discovered may have been made and used by Adam and his numerous descendants. With regard to the discovery of the long-lost flint mines of Egypt, Mr. Seton-Karr came across one day on the hidden cliff plateaus of the Wady Sheik what appeared to be ruined cities of vast extent. He felt convinced that he had at last found the lost mines. Each of the mines was characterised by its own special types of implements, which Professor Flinders Petrie declared to be of the greatest possible interest, and hitherto unknown to science. They consisted of axes, wedges, spear-heads, rings, disks, sickle-shaped knives, and stone truncheons, many of which lay as the workmen had last left them, when they went home to dinner one day, perhaps, thousands of years before Thebes or Memphis were ever dreamed of.

"EATEN with Honour" is the grimly humorous title of an article in the Contemporary, by Mr. Flinders Petrie, to prove that the pyramid builders of ancient Egypt were partial cannibals. In the winter Mr. Petrie cleared away a group of early tombs in an Egyptian cemetery. In the arrangement of the bones, not in one but in several tombs, he saw clear indications to him that the bodies had been cut up, the bones picked and cleansed, separately wrapped up and buried with every care and honour. The eating of the body is supposed to have been part of the customs of the burial, just as in the cases of Australian cannibalism of which we have heard in modern times.

MR. E. A. ABBEY, whose large canvas at Burlington House, "Hamlet," has been named by many as "the picture of the year," is an American who is well known on both sides of the Atlantic. The great work of Mr. Abbey's life, up to the present, is the series of large pictures he executed for the decoration of the Boston Library. These he painted in his country studio, one of the finest in England, at Fairford, in Gloucestershire, and exhibited them in London before taking them across to the States. Both Mr. Sargeant and Mr. Whistler have helped to enrich the Boston Library, the former exhibiting a portion of his work a few years ago at the Academy. Mr. Abbey was commissioned to fill one of the spaces in the Royal Exchange last year; and his work is perhaps at its best when dealing with this form of decoration.

THE ceremony of unveiling the memorial to the late Joseph Thomson, the African explorer, a native of the district of Thornhill, in Scotland, was performed at Thornhill by Sir Clements Markham, president of the Royal Geographical Society. Mr. Charles McBride designed the memorial, which is in the form of an obelisk resting on three steps, and surmounted by a bust in bronze of the distinguished explorer. The four sides are panelled and inscribed with the explorer's name and a record of his expeditions and scenes in Africa.

IN the Clifford Gallery, 21, Haymarket, the members of the Surrey Art Circle, of which Mr. Alfred Gilbert, R.A., is the president, have a small Exhibition. Mr. Montague Smith's "Returning Home" agreeably recalls French methods and colouring, and represents, if we mistake not, some scene in the Pas-de-Calais. The broad, vigorous sketch in oils "In the Meadows" gives a higher idea of the abilities of Mr. Claude Hayes than do his finished works, acceptable as these almost invariably are. It indicates a breadth of handling, a loving intimacy with one of Nature's less amiable moods, which further finish would but obscure. Mr. E. Reginald Frampton's "Sancta Cecilia" is a pretty rhythmic design of the hyper-aesthetic type—an amalgamation of the Burne-Jones and Frank Dicksee styles. The "Glimmering Dawn" of Mr. W. Tatton Winter—an apparently simple yet skilful composed study of upright trees in the early morning light—is marked by a certain tenderness and mystery. A decorative and finely wrought tapestry, designed by Mr. Edward Frampton and executed by Mr. W. Sleath, has "The Annunciation" as its subject. The design is woven in the orthodox fashion, some of the lights and adornments being, however, put in with good effect in bright-coloured silks, though by the same legitimate method of execution. The colouring of the whole is both subtle and brilliant. Mr. Gilbert himself shows a powerful bronze statuette, "Comedy and Tragedy," in the style of the Florentine Quattrocento, and of Donatello in particular.

AT Rosdzin, in the coal district of Silesia, a part of the town, comprising about fifty houses, has been undermined, and is about to collapse. Houses above the mines have shown great cracks in their walls, and only a short time ago a druggist had to give up his house and shop because it threatened to collapse, or to sink into the earth. At last what had long been feared really happened, although a technical commission only lately gave the opinion that no more subsidences would take place. In the afternoon one half of the miners' hospital sank eighteen inches. At one in the morning the other wing of the building followed suit. At the same time walls of neighbouring houses cracked, vaults and ceilings of rooms fell in, and the inmates fled in a panic with only a few necessities to the market place. Landslips are spreading in the neighbourhood, and more houses are threatened.

DEPTFORD now boasts a third public recreation ground. Deptford Park, as it is henceforth to be called, consists of a central playground, surrounded by a broad promenade bordered by trees. Seventeen acres in extent, it lies on the delta of the Ravensbourne, to the north of the Grand Surrey Canal, and has its principal entrance in Deptford Lower Road. The land originally belonged to the Evelyn Estate, and was cultivated until recently as a market garden. It was purchased for £36,000, towards which the County Council has contributed £24,000, the Greenwich District Board of Works £8000, Mr. W. J. Evelyn, the lord of the manor, £2000, and the trustees of the London Parochial Charities £800, whilst private subscriptions have been raised in the district to the amount of between £900 and £1000. The laying-out and fencing of the park has cost £7500.

DURING the Parliamentary inquiry concerning the proposed "Westminster Improvement" schemes, an excellent suggestion was made, which it is to be hoped will not be lost sight of. It was to the effect that Dover House, Whitehall, should be secured as the future official residence for the Prime Minister of England. There are many arguments to be advanced in favour of this proposal, says Mr. H. W. Brewer. In the first place the situation of Dover House, between the Treasury buildings to the north, and the Horse Guards to the south, with the Admiralty close at hand, the Foreign Office equally near, and the site for the proposed War Office opposite, renders all these public offices easily accessible. Then, also, as Dover House was erected to serve the purposes of a town mansion, it is far better suited for

such an object than for a public office. Architecturally it is certainly a building which should not be allowed to disappear, because it is decidedly handsome, especially so as to its portico and dome-capped entrance-hall, staircase, &c. The apartments, also, are well-proportioned and excellently calculated for the kind of receptions which are held by a Minister of State. Your readers have no doubt often noticed the well-designed Ionic portico which projects over the pavement, between the Treasury buildings and the Horse Guards. This graceful adjunct to Dover House was added by the Duke of York, who purchased Dover House in 1789, and from whom, for some years, it used to be called "York House." The earlier portions of the building, which are at the back, consist of the reception and dwelling rooms, while the roof is seen rising over the dome which covers the entrance hall (also an addition made by the Duke). The house was designed by an Architect of the name of Payne for Sir Matthew Fetherstonehaugh, who, according to Mr. Walford ("Old and New London"), sold it to the first Lord Melbourne, father of the late Premier. Subsequently it came into the hands of the Hon. George Agar-Ellis, Lord Dover, from whom it receives its present appellation of Dover House. It is almost the last of the eighteenth-century mansions left standing in Whitehall, and is regarded by Architects and architectural writers as an excellent example of a domestic building of that period.

At Bridgwater it has been decided to commemorate the forthcoming Jubilee by erecting a statue or memorial to Admiral Blake, who was born in that place close upon three hundred years ago. The only existing memorials of Blake are a window in St. Margaret's, Westminster, and a bust in the Shire Hall, Taunton, and the committee believes that there are many in Great Britain who would be willing to assist in perpetuating the memory of a man who contributed so largely to the preservation of our national greatness and prosperity by the erection of a statue in his native town.

THE Corporation of London has given a commission to Mr. A. C. Gow, R.A., for a painting of Her Majesty's visit to the City on the 22nd inst., and which, when completed, will be deposited in the Guildhall Art Gallery. The point which has been determined upon for the picture is the Queen's arrival in front of St. Paul's Cathedral, the background being occupied by the edifice itself and by the assembled clergy.

In an appeal for funds to carry out works of restoration, the Rector of Whitechurch, Edgware, Middlesex, states:—"The Church of Little Stanmore, otherwise Whitechurch, was erected in the reign of Henry VIII., and almost entirely rebuilt in 1715 by the munificent Duke of Chandos, who fitted it up after the model of a Royal Chapel, and caused the walls and ceilings to be decorated with paintings by two French Artists—Verrio and Laguerre. The Church also contains paintings by Bellucci, and notably one on the ceiling of the west gallery, being a copy of the Transfiguration by Raphael. It is at this Church also that during the years 1718-1721 the immortal Handel was organist, and William Powell, the "Harmonious Blacksmith," who was parish clerk at the same time, is buried in the churchyard. The Church is now in great need of repair, and, unless a great effort is soon made to stop the dilapidation going on, will soon be in danger of serious injury. Handel's organ stands behind the altar, and is only approached by a dark and almost inaccessible passage, yet is visited by many hundreds of people each year. Therefore it is with confidence that we appeal to all lovers of Handel's music to help us to raise £1000 for the restoration of the Church and the erection of a proper organ-chamber worthy of the memory of that immortal composer as a suitable commemoration of the Diamond Jubilee of our good Queen Victoria."

## DISINFECTION.\*

### PHYSICAL, CHEMICAL, AND MECHANICAL.

By W. NOBLE TWELVETREES.

COUNTLESS ages ago, when this world was in a state of incandescence, it may safely be assumed there was no need of disinfection nor of disinfecting apparatus. If ordinarily accepted theories as to the future be correct, equally sanitary conditions will ultimately prevail. The intermediate period is one in which the once molten and vaporised elements have become transformed into myriad forms of animal and vegetable life. Man, representing the highest type of earthly life, finds in his world some things pleasant and good, others pleasant, but perhaps not good, and many neither one nor the other. In the last category may be placed the products, organic and inorganic, which are appropriately dealt with by disinfection.

#### HISTORY.

The practice of disinfection has been traced back to very remote times. There is ample evidence showing that primitive man endeavoured, not only to hide evil odours by the agency of perfumes, but to destroy direct causes of infection by chemical substances. Public worship in the earliest days was attended by practices based on an intelligent perception of the value of disinfection. So far, indeed, were habits of cleanliness inculcated, that hygiene formed an important part of the various religions of the world. The most remarkable instance of this alliance between "Cleanliness and Godliness" is to be found in the Mosaic laws, framed about the year 1600 B.C., which contain precise hygienic regulations for the person, dwelling, and camp. These laws also direct the avoidance of blood and unclean meat as articles of diet, and the isolation of those suffering from contagious disease. Blood is well known to be the most putrescible constituent of meat, and the flesh of the pig is extremely apt to harbour parasites—a tendency not lessened by the very cosmopolitan palate possessed by this familiar but thoughtless animal. There is no doubt that the Levitical laws have proved a most important factor in maintaining the permanency of the Jewish race. The ancient Greeks were well acquainted with the uses of sulphur as a disinfectant, and the ancient Romans thoroughly appreciated the advantages of good ventilation, water supply, and drainage. Their practical good sense was also evinced by the appointment of State physicians in their towns and cities. It is disappointing to find that after the advent of Christianity the civilised world suffered a relapse with regard to this branch of social science. Owing to monkish superstition, epidemics and diseases came to be regarded as dispensations of Providence, which it would be sinful to combat save by prayer and penance. As a consequence the people became far less cleanly in their modes of life than the Jews and heathen. The state of London in Mediæval times cannot have been particularly agreeable, from a modern point of view, considering the absence of proper drainage, of ventilation, and of pure water. During the eighteenth century some improvements were effected, but these advances in the direction of sanitation were made without precipitate haste, and in such a manner as to cause no violent shock to the feelings of the most conservative. In 1832 an outbreak of cholera in London directed attention to questions of Sanitation and Disinfection, resulting in the first of a series of measures which have done so much to render London one of the healthiest amongst the cities of the world. Up to the middle of the present century disinfection in the proper sense of the word was hardly considered. In fact, the well-known dictionary of Dr. Johnson, published in 1785, neither contains the word "disinfect" nor any of its deriva-

tives. The nearest approach is the word "fumigate," to perfume by smoke or vapour. Prior to the universal acceptance of the germ theory, the word disinfectant was used chiefly to denote substances with the power of absorbing effluvia, or of "masking" noxious odours by other odours of more powerful and sometimes of less unpleasant character. The labours of a devoted band of scientists have during recent years given to the world, not only the germ theory, but the practical science of bacteriology. In the light of their discoveries it will be seen that a true disinfectant should go directly to the root of the evil, and absolutely kill the organisms causing putrefaction or producing disease. It is, however, convenient to retain the use of the word disinfectant as a generic term, including true disinfectants (or sterilisers), deodorants, and antiseptics.

#### MODES OF DISINFECTION.

Disinfection may be effected in any of the following modes:—First, by establishing physical conditions unfavourable to the existence of germs; second, by the employment of agents causing chemical changes in germs and volatile substances contained in the air; third, by the use of mechanical disinfectants which absorb substances of injurious character. Natural and artificial filtration are included in the latter class, although their effect is exclusion rather than destruction of germs. The various modes of disinfectants and their practical application will be referred to later, but first it will be useful to consider briefly the constitution and characteristics of the germs which have to be dealt with, and the conditions unfavourable to their production. Bacteria or microbes, as they are popularly termed, are minute unicellular organisms, the cells being transparent and colourless, with an enveloping membrane. The contents are protoplasmic, and there is no nucleus. Microbes occupy so low a position in the system of evolution that it is difficult to locate them with certainty in either the animal or vegetable kingdom. Some authorities boldly describe them as plants, others speak of them as "living creatures," but cautious writers more generally use the safe and non-committal term "micro-organism." Micro-organisms are variously classified as follows: Sapro-phytes—growing on dead substances; Parasites—on living bodies. Parasites are divided into Obligate Parasites—incapable of existence apart from the body; Facultative Parasites—capable of life both on and apart from the body. Further, micro-organisms are spoken of as Ectogenous—only occurring outside the body; Endogenous—only existing inside; Ambigenous—existing either outside or inside. Another classification divides these organisms into (1) Aerobes—unable to live without oxygen. (2) Obligate Anaerobes—unable to live with oxygen. (3) Facultative Anaerobes—able to live with or without. The latter are naturally the most troublesome to extirpate. The multiplication of bacteria takes place either by fission or by formation of spores. In the case of fission, the individual cell, when of full size, splits in the centre, and, if the "daughter cells" do not break away, a group is formed. In spore formation, the greater part of the contents collects at one point, forming the spore. The remaining portion of the cell perishes, and the mature spore remains. Spores have remarkable powers of resisting chemical agents, heat, cold, hunger, and thirst. The process of multiplication is extremely rapid; generation succeeds generation within periods of time measured by minutes. The number of bacteria theoretically developed in forty-eight hours from a single specimen is no less than 280 billions. It is fortunate various circumstances tend to limit so reckless a tendency to over-population. As a class, micro-organisms are distinctly unpopular. In fact, it is probably not exaggerating matters to say that the self-respecting citizen has no better opinion of a microbe than an ordinary police magistrate has of a cyclist. Microbes suffer in public estimation owing to mischievous results on the part of a small proportion of their number, known as disease-producing varieties.

(To be continued.)

\* A paper read before the members of the Civil and Mechanical Engineers Society.

## ENGINEERING SCHEME AT SCARBOROUGH.

**D**URING the past few weeks active preparations have been made at Scarborough for commencing the construction of a road and marine drive round the foot of Castle Hill. It is proverbially useless to argue on matters of æsthetic taste, and as little heed has been paid to the growls of the antiquaries, and of the Artists who have delighted to sketch the old Castle Hill and red-roofed houses which nestle at its base, as to the protests made a year or two ago regarding the railway to the summit of Snowdon. But the Scarborough Corporation has one important point to urge in favour of this road, over and above mere utilitarian views. The base of the Castle Cliff is mainly

COMPOSED OF CLAY SHALE,

with occasional sandstone, and erosion by tidal action has been considerable, especially on the north and east sides. Serious slips of the upper cliff have taken place within the present century, and the date when the Castle Yard itself may be jeopardised is not so remote as some persons who talk of the "everlasting hills" imagine. The new sea wall, it is anticipated, will effectually check this invasion of the sea, and though in the process of construction the Castle Hill will have to be scarfed down in places, it is confidently believed that the end of the damage will then have been reached. The Corporation is negotiating with the Woods and Forests Commissioners to remove the firing and other military operations from the Castle Hill to a site outside the town, and it is hoped, by laying out the hill slopes as a pleasure ground, that there will be no offence to the eye, even of the Artist, when once the wall has lost its "new" aspect. The extent of the present operations may be judged from the fact that the contract with Messrs. Cooke and Co. is for £69,270, and this does not include the asphalted of the road, the erection of toll-houses, or the provision of an approach from the South Foreshore Road. It is estimated that in all £100,000 will be required for this scheme—which is the third and final act for providing Scarborough with a fine long drive by the sea-front. As far back as 1882 the Corporation took the matter up, and the late Sir John Coode, one of the first experts on marine work, was consulted. He visited Scarborough in the following year, and surveyed the ground, and presented a long report, in which he declared that the scheme presented no

## INSUPERABLE ENGINEERING DIFFICULTIES.

He held that, provided the wall was constructed thick enough in the exposed portions, it would be perfectly safe. Nor did he share the view that the road would increase the danger to craft entering the harbour in a gale by creating what is called a "backwash." Sir John Coode suggested that if the whole scheme was regarded as too huge to embark upon at one time, it might be divided into two parts, and the less dangerous and costly half—the Marine Drive, on the North Side—taken in hand first. This suggestion was acted on, and what is called the Royal Albert Drive—stretching from the north end of the Castle Hill, along the North Bay—was constructed at a cost of over £50,000, and opened in June, 1890, by the late Duke of Clarence. It was soon realised, however, that the work could not end here, for Scarborough had now a fine promenade on the south side, and an even finer drive on the north side; but the Castle Hill isolated the one from the other, and greatly reduced their value, especially to visitors. In 1889 the Scarborough Corporation obtained in a Local Improvement Act power to spend £70,000 on the construction of a road round the Castle Hill; but many delays occurred, and it was not until last year that definite steps were taken to obtain estimates for the work, and to appoint a resident engineer, Mr. J. E. Everett, of Totton, Southampton, to superintend the construction. Then a further hindrance arose, the town having to be again polled to get sanction to the spending of more than the £70,000 authorised by the Improvement Act,

and there were also negotiations with the Harbour Commissioners, and their engineer, Mr. Philip Messent, as to the best form for the wall, and its junction near the outer pier, so as to send the waves which run along the wall outwards from instead of on to the pier. All these difficulties have, however, been now adjusted, and in the hands of Messrs. Cooke and Co., who have had great experience in Brighton, Eastbourne, and other towns, of marine work, the speedy construction of the wall is expected. The

## LENGTH OF THE NEW WALL,

from its junction with the East Pier to its junction with the Royal Albert Drive, is 4,100ft., and in form it will be a flat hollow curve. The face of the wall will be of concrete blocks throughout, and the height will vary from 13ft. to 19ft. above high water at ordinary spring tides. The foundations of the wall will be carried into the shale bottom, and the wall will vary in thickness according to the degree of exposure to the action of the tide, from 17ft. at the base, and 6ft. at the top, to 30ft. at the base and 10ft. at the top, while the concrete blocks to be used range from 1½ tons to 10 tons in weight. The space between the wall and the mainland will be filled in with rubble and cement, a promenade being provided 20ft. wide, and a carriage-way 40ft. in width. As already indicated, it will be necessary to scarf down the cliff in places, where the overhanging rocks appear dangerous, but this work will be done with a sparing hand, and possible accidents guarded against by the construction of a catch-pit on the mainland side, to receive any falling earth or rock, while effective drainage will also be provided to secure the return of any water or spray which may come over the most exposed parts of the drive during an exceptionally high tide.

## METROPOLITAN STREET IMPROVEMENTS.

**A** LIST of the street improvements in the metropolis, contemplated by the Improvement Committee during the present year, has been presented to the London County Council. The localities of the suggested improvements are Rosemary Branch Bridge, Hackney and Shoreditch, Roehampton Street, Westminster, Albert Embankment, Lambeth, and York Road, Battersea and Wandsworth. In the first case it is proposed to rebuild the Rosemary Branch Bridge over the Regent's canal. The total cost of the work is estimated at £6800, towards which the vestries of Shoreditch and Hackney are each to be asked to contribute. The estimated net cost to the Council, after deducting contributions, will, if the scheme is carried out as suggested, be £4100. The proposed improvement in Roehampton Street, Westminster, is in the nature of a continuation of the thoroughfare, in order to afford additional communication to the new streets proposed to be laid out by the Council on the Millbank prison site. The estimated net cost of the work, including the acquisition of property, is £5700. The Vestry of St. Margaret and St. John, Westminster, has offered to contribute £500, but the Committee thinks this an insufficient amount, and recommends the Council only to carry out the work on the local authority agreeing to contribute one-fourth the net cost. An improvement of considerable magnitude is suggested

## AT THE ALBERT EMBANKMENT,

Vauxhall. The proposal is that the Council should undertake, as a county improvement, the widening of part of the Albert Embankment formerly called High Street, Vauxhall, between Vauxhall Walk and Kennington Lane. The matter has several times been before the Council, and repeated attempts have been made to secure a contribution from the local authority. This has been persistently refused, but it has been pointed out that the construction of the Albert Embankment was carried out as a county improvement, that the present proposal is a continuation of that improvement, and that the cost should therefore be paid out of the county fund. The Committee

feels that there is much force in that argument, and has decided to recommend the Council to carry out the work without a contribution from the local authority. The present width of the road, which runs north and south, varies from about 40ft. to 60ft., and it is proposed to increase this to 60ft. throughout by setting back the eastern side. The estimated net cost of the paving and other works is £3700, and of the property, after deducting recoupment, £30,300, making together £34,000. The fourth suggested improvement is the widening of York Road, Battersea, between Falcon Road and Wandsworth Station. In July, 1891, the Committee brought up a report recommending the Council to undertake the widening of this road, subject to contributions being made towards the cost. The report

## INCLUDED NINE LARGE IMPROVEMENTS,

estimated to cost in all £2,097,625 net, and the Council referred it to the Committee to bring up those of the nine improvements, which it considered to be of the greatest urgency, with the result that the York Road widening had to stand aside for other improvements which, at the time, were even more urgent. Recently, however, it has become more and more apparent that the widening of York Road is a work which cannot be longer postponed without grave inconvenience, and the Committee has, therefore, had plans prepared with a view to recommending the Council to carry out some portion of the improvement. The proposed scheme embraces the widening of the portion of York Road, within the parish of Battersea, commencing near Falcon Road and terminating at John Street, and the widening of the portion of York Road, within the parish of Wandsworth, commencing at John Street and terminating at Wandsworth Station. The total net cost of the complete scheme is estimated at £80,150, and of that amount the local authorities are to contribute one-fourth. Nearly the whole of the property to be acquired for the improvement consists of fore-courts, and the estimates of the cost have been prepared on the assumption that Parliament will grant the Council power to acquire, where necessary, the fore-courts only, instead of being compelled to purchase the houses as well. In fact, the Committee considers the granting of this power should be a condition of the carrying out of the improvement, as otherwise the

## COST OF THE PROPERTY

would be prohibitive. It will accordingly be necessary for the Council to ask Parliament to exempt it from section 92 of the Lands Clauses Consolidation Act, 1845, which provides that where the promoters of a public undertaking, acting under statute, require to take part of a house, the owner shall have the right of calling upon them to take the whole. The estimated net cost of the four suggested improvements, without deducting contributions, is £126,650; and after deducting contributions £102,487; the annual charge on the rates for interest on and the repayment of debt, calculated on the net cost, is £4,270, equal to '028d. in the pound and the annual charge decreases each year by £42.

A LARGE reading room is to be added to the Kensington Library, which will be closed for a month during the progress of the structural alterations.

MR. ROBERT SNODGRASS, Architect, has just died at his residence, Prospect Hill, Beith, at the age of 58 years. Mr. Snodgrass was well known throughout North Ayrshire, and had an extensive business as an Architect.

The following return has been compiled by Messrs. C. Isler and Co., of Southwark, who have just sunk an artesian bored tube well to the depth of 450ft. at Islington Baths for the Hornsey Vestry:—Made ground, 1ft. 6in.; brown clay, 23ft. 6in.; London clay, 81ft. 6in.; mottled clay, 25ft.; conglomerate pebble beds, 3ft. 3in.; green sands, 35ft. 9in.; running sands, 5ft.; green sands, 17ft.; chalk, 258ft.; total, 450ft. The water level stands at 165ft. from the surface.

## Professional Items.

**ABERDEEN.**—The Plans Committee of the Town Council has had before it a plan of a warehouse proposed to be built by Mr. John Edwards upon the west side of Bridge Street, adjoining the steps leading to Crown Terrace. The buildings will extend back to Crown Terrace, and it will be necessary to erect a retaining wall on the side next the terrace. The burgh surveyor is of opinion that this wall will require to be 10ft. 6in. broad at the base, and as this will curtail the size of some of the rooms in the proposed buildings, the sub-committee suggest that, as part of the arrangement after-mentioned, Mr. Edwards should, in so far as the Town Council is concerned, be allowed to erect a portion of the retaining wall under Crown Terrace, representing an area of twenty-five square yards. The retaining wall would be 10ft. below the surface of Crown Terrace, and therefore would not interfere with the laying of drains and sewers, or gas, water, or electric mains. Mr. Edwards's property projects slightly beyond the building line of Bridge Street, from the Crown Terrace steps southwards, and by the removal of the old building at the south boundary of the property, an opportunity would be afforded of adding part of the site to the street. The Committee resolved to recommend that the Council should (1) approve of the plan; (2) allow Mr. Edwards, in so far as the Town Council is concerned, to erect the portion of the retaining wall under Crown Terrace as suggested; (3) acquire from Mr. Edwards, for the purpose of being added to the street, (a) the ground in Bridge Street tinted yellow on the plan; (b) the verge in Bridge Street which projects beyond the present building line of the street; and (c) a verge 1ft. wide along the front of the property to Crown Terrace, for the purpose of preserving the present building line of the terrace—in all fifty-seven square yards—upon the understanding that the question of the amount of compensation to be paid by the Council to Mr. Edwards is to be referred to Mr. R. G. Wilson, Architect, as sole arbitrator.

**ACTON.**—The foundation-stone of a cottage hospital at Acton, to be erected in commemoration of the Queen's reign, was laid on the 9th inst. by Lady Rothschild. The cost of the building will be £2500, which has been provided by Mr. Passmore Edwards, while the site in Gunnersbury Lane has been given by Lord and Mr. Leopold de Rothschild. The building, which has been designed by Mr. C. Bell, will consist chiefly of a ground-floor story. The main wards are at each side, one for males and one for females, each containing four beds and a cot, and there will be a room for convalescents, an operating room, hospital dispensary, accommodation for matron and nurses, and administrative offices. Above will be seven rooms, available as bedrooms or as special rooms for patients.

**BALLATER.**—The Commissioners of Ballater have recently been taking steps in various ways for the improvement of the burgh. Formerly the water supply of Ballater was drawn from the Gairn, at a point near the Mill of Gairn, fully a mile and a half from the Square of the burgh, and was conveyed in 4in. cast-iron pipes. The new scheme consists of the laying of an additional cast-iron pipe, 9in. in diameter, from a point about three-quarters of a mile further up the Gairn than the old intake, alongside the existing pipe to near the Square of Ballater. The intake of the new pipe, as already stated, is about three-quarters of a mile above the old one, at a place known as Ballachrosk; and whereas the intake of the old pipe is in the mill-lade at Mill of Gairn, the new intake is by a sub-soil branch along the bank of the stream. The water, certified otherwise as of excellent quality, is thereby filtered to a certain extent before entering the pipe. After passing into the pipe the water is conveyed through the existing reservoir near the Gairn, and thence again, in the new pipe, the supply is conveyed to the burgh. The total cost of the new works

has been about £1600. Messrs. Jenkins and Marr, Aberdeen, who were engineers for the original system, are the engineers; the contractor being Mr. Thomas Mitchell, plumber, Ballater.

**BRIGHTON.**—The whole of the wrought-iron entrance gates, forecourt railings, stair railings, &c., in connection with the New Municipal Technical School, Brighton, have been supplied and fixed by Messrs. Thos. Brawn and Co., Birmingham, who also have lately fixed the wrought-iron entrance gates, and those now in course of erection at Kingston Hall, Notts—a residence of Lord Belper.

**CAMBRIDGE.**—The Mill Road branch of the Cambridge Free Library has been opened. The design is carried out in red brickwork, red terra cotta, and red Mansfield stone, with a slate roof. The elevations are relieved by pilasters with terra cotta caps, sunk and moulded panels and string courses, embellished with carving. The building consists of one large room, 107ft. long by 24ft. wide, divided into a lending department and a reading room. On the north side there are eight large windows, which have stone mullions, transoms and heads, in which clear glass is fixed, the top portion being arranged to open; and, in addition, there is a lantern with glazed sides and end light running the whole length of the building. The roof, which is of semi-circular construction, is carried on eight semi-circular steel principals, which spring from the stone caps of the piers. Over the entrance there is a gable, in the centre of which is carved "1897," with the Crown above, and the rose, shamrock, and thistle beneath. On each side of the gable a lion on a pedestal in red Mansfield stone, supporting a shield with the Borough Arms, is fixed as a terminal. In the centre of the lantern in the roof is worked an octagon cupola, which is glazed with amber glass, and has a cheerful appearance; permanent ventilation has been arranged for in the cupola. The end facing Mill Road is designed to mask the roof, and has panels of moulded brickwork, and three fluted pilasters finishing with a carved pediment, in which the words "Free Library" are worked. The hot water and gas fittings were supplied by Messrs. Macintosh and Sons, the centre lights being from designs supplied by the Coalbrookdale Company. Mr. Frank Waters, of Sidney Street, Cambridge, was the Architect, and Messrs. Coulson and Lofts, of East Road, were the builders. Mr. Wren acted as clerk of the works.

**CARDIFF.**—The laying out of Cathays Park was recently considered by the Town Hall Committee of the Cardiff Corporation, and a resolution moved that the new Town Hall and law courts should be placed at the southern end of the western side of the park. It was stated that the Corporation should first of all select its own site, and after that it would be open to other authorities to apply for sites.—Mr. David Jones did not think that the Town Hall and the law courts should be under the same roof, but, at any rate, they should be close together. He would like to see the whole of the municipal buildings in a cluster.—The resolution was put to the meeting, and carried by seven votes to two.—It was then resolved that advertisements should be inserted inviting designs for the new Town Hall and law courts, and that prizes of £500, £300, and £200 be offered for the three best designs, the prize of the competitor whose design was adopted being merged in his commission as Architect.—A proposal was made that an expert should be engaged to report and advise the committee as to the best way of laying out Cathays Park as a public park, reserving room for the new Town Hall, law courts, a museum, a national museum, offices of the university, and other public buildings; but Mr. Jones pointed out that this was premature, because they did not know how much land would be required.

**CHELMSFORD.**—The foundation-stones of the new Wesleyan Chapel in High Street were laid recently. Messrs. Gordon, Lowther, & Gunton, Finsbury House, London, prepared plans

showing a building with the main entrance in High Street, and under a finely proportioned archway with a six-light mullioned window and flanked by an octagonal tower. The interior of the chapel will consist of nave, two transepts, chancel, and an organ-chamber, and accommodation will be provided for about 600 or 700. Over the nave there will be a gallery. In addition to the chapel, there will be Sunday schools, vestries, &c., these being erected at the rear of the chapel. The schools will be approached by corridors from the chapel. The style of the building is Late Decorated throughout. The walls are to be faced with red bricks, with stone dressings, and the roofs will be covered with Broseley tiles.

**CLAPHAM, S.W.**—At a recent meeting of the Building Committee of the Schools of St. John the Divine, it was decided to build new boys' and girls' schools in place of the existing ones, and Mr. Philip A. Robson, A.R.I.B.A., of Bridge Street, Westminster, was authorised to prepare plans at the earliest possible date. The building is intended as a commemoration of the Jubilee, and the new site, which is next the present infant school, is at the corner of Union Road and Gaskell Street.

**CROSBY RAVENSWORTH.**—A new reredos has just been erected in the Parish Church. The centre panel of the reredos is a copy in oak of the well-known picture by Leonardo da Vinci, representing the Last Supper. It was carved by Mr. Kirkbride, Barbon. This part of the carving is covered by a canopy, which gives great dignity to the appearance of the reredos, and the whole is surmounted by a finely carved cross.

**DUNDEE.**—Plans and sections of proposed new buildings, &c., in Dundee, have been lodged with Mr. William Mackison, F.R.I.B.A., &c., Burgh Engineer, as follows:—Cleghorn Street and Benzie Road, shops and dwelling-houses for John Wilson; Coupar Street and Gordon Street, shop and dwelling-houses for David Lowe; Edward Street, batching-house and jute warehouse for John N. Kyd and Co.; High Street, Lochee, organ chamber for the Committee of St. Luke's Parish Church; Hilltown; addition to property for James McCormack; Lochee Road and Gardner's Lane, alterations on property for Mrs. J. A. Bruce; Mains Road, alteration on warehouse for J. and A. D. Grimond, Limited; Melville Terrace, double villa for William Scott; Perth Road, addition to building for Alexander Henderson; Rankine Street, double villa for George A. Harris; Scott Street, tenement for James Cook; Urquhart Street, dwelling-houses for Very Rev. Joseph, Canon Holder; Westfield Lane, stable, &c., for Agnes Wilkie; 6, Windsor Street, wash-house, &c., for Mrs. Young; Tay Foundry, evaporative condenser for Whyte and Mair.

**GAINSBOROUGH.**—The John Robinson Memorial Church at Gainsborough, the stone of which was laid last year by Mr. Bayard, then Ambassador of the United States, was opened on the 9th inst. The cost has been £7000, £4000 of which has been raised. The Church accommodates 600, and has a school, hall, church parlour, and vestry. It is designed as a memorial to John Robinson, of Gainsborough, pastor of Leyden Church, originally founded in Gainsborough; and the source of American Congregationalism, through John Robinson, the father of the Independents.

**HUDDERSFIELD.**—A new infant school in connection with St. Thomas's Church, Manchester Road, Huddersfield, was recently opened. The school has been built at a cost of £850. Accommodation will be afforded for 125 children.

**HULL.**—A scheme for providing an Art Gallery for the town in commemoration of Her Majesty's Jubilee has been prepared. It is proposed to construct an Art Gallery, 73ft. by 25ft. 6in., immediately over the present Museum, having a vestibule 29ft. by 11ft. 6in., with cloak-room and other offices adjacent. The site is valued at £2000.

**LLANBRADACH, CARDIFF.**—A new Church at Llanbradach has just been opened. The Church is situate close to the Rhymney line, and has been erected from designs by Mr. Bruce Vaughan, the Architect of St. James's, Cardiff. The style of the building is English Gothic of the 13th century. It is built of the native stone. The nave inside measures 61ft. long and 26ft. wide, flanked on either side by aisles 13ft. wide. The chancel is to be built at a future time. The Church accommodates about 500 persons, and will cost about £3000. Messrs. Williams and Thomas, of Cardiff, are the contractors.

**LYNN.**—The opening of St. Mary's Church recently took place. The former Church, which stood on practically the same site—in London Road, at the corner of North Everard Street—and which was erected in or about 1844, was considered to be so unsafe that last year it was pulled down. The style of the new Church is curvilinear Decorated Gothic, treated somewhat severely. The walls are faced with Carr stone, with Bath stone dressings. The roof is of open timber work covered with slates. A stone turret flanks the great gable next London Road, surmounted by an oak open-framed top, covered with red tiles, and with a lofty lead-coloured spire with cross. The plan comprises nave, chancel, altar, and the special shrine of our Lady of Walsingham, which will be an exact copy of the Holy House of Nazareth now at Loretto, Walsingham being within the limits of the King's Lynn Mission. The area of the Lady Chapel is 18ft. by 7ft., and in extension of the length of it will be an ante-chapel 10ft. long; while there is space upon which another aisle can be erected hereafter. The Architect is Mr. W. Lunn, of Great Malvern, and Mr. W. Hubbard, jun., of Dereham, is the builder. The estimated cost is £2000.

**MANCHESTER.**—The Manchester Corporation having applied to the Local Government Board for sanction to borrow £130,000 for the purpose of extending the electric lighting works and system, Colonel J. T. Marsh, R.E., recently held an inquiry for the purpose of taking evidence. One of the witnesses examined was Alderman Higginbottom, who explained the electric lighting scheme in detail, mentioning that Manchester was the first city in the United Kingdom to adopt the five-wire system. The area of supply had gradually increased, and in order to cope with the increased demand for electricity for lighting and motive power, it was absolutely necessary that the plant should be enlarged at once. Dealing with the varying capacity of the plant, he said that in 1893 it was 40,000 eight-candle lamps, that in 1894 it was increased by 16,000 lamps, and that in 1895 and 1896, up to March, 1897, it was increased by 72,000 lamps, making a total of 128,000 lamps. Another side of the progress was shown as follows: In 1893 there were 289 consumers, and 32,716 lamps; in December, 1894, the consumers were 624 and the lamps 60,298; in December, 1895, the consumers were 1018, and the lamps connected 93,290; in December, 1896, the consumers were 1466, and the lamps 133,504; and in May of this year the consumers were 1620, and the lamps connected 147,068. There were also awaiting connection 52 consumers and 14,526 lamps, making the total number of consumers connected and awaiting connection 1876, and the number of lamps connected and awaiting connection was 161,594.

**MIDDLESBROUGH.**—Estimates prepared by Mr. Baker, Borough Engineer, for three schemes of street improvement in connection with the tramways extension have been submitted to the Corporation. The streets named are Ferry Road, Durham Street, Cleveland Street, Queen's Square, Albert Bridge, Exchange Place, Albert Road, Grange Road, Linthorpe Road, Linthorpe Avenue, Linthorpe Crescent, Bridge Street East, Dock Street, Zetland Road, Marton Road, Corporation Road, Newport Road (including re-laying sett paving), Parliament Road, Calvert Street, Oxford Road, and North Ormesby Road. The first estimate is for paving across the whole width scoria

bricks on concrete, with new channels, re-laying kerbs, new kerbs and gullies where required—dedicated streets, £23,933; undedicated streets, £3071—total, £27,004. Estimate No. 2: For macadam, with new channels, re-laying kerbs, new kerbs and gullies where required—dedicated streets, £9729; undedicated streets, £1233—total, £10,963. Estimate No. 3: Ordinary macadam, with new channels, re-laying kerbs, and gullies where required—dedicated streets, £7146; undedicated streets, £899—total, £8,046.

**NOTTINGHAM.**—The parish buildings recently erected at the corner of Station Street and London Road, Nottingham, have been opened. The site upon which it stands was the only available one, but distinctly appropriate for the particular character of the premises, which are of red brick, and have practically reached completion. In the basement are two spacious class-rooms, with partitions, capable of being thrown into one, and adding to the accommodation of a large hall which directly adjoins them, and can seat between five and six hundred persons. On the same floor a kitchen, lavatories, and storage rooms are included, and extensive cellarage has also been built. On the second floor are two more large class-rooms. The building is heated upon most approved principles, and the whole structure has entailed an expense of over £4000.

**RHOSLLANERCHRUGOG.**—The new Welsh Congregational Chapel was opened a few days ago in Bank-street, Ponkey. The chapel is built of red Ruabon facing bricks and terra cotta, part of the façade being of Cefn freestone. The size of the chapel is about 48ft. by 36ft., and the vestry is 20ft. by 15ft. There is also a boiler room measuring 12ft. by 10ft., and the chapel has seating accommodation for about 230. The cost is about £1100; the Architect is Mr. Gummow, Wrexham, and the builder Mr. J. Davies, Ruabon.

**ROSEHEARTY.**—The design prepared by Mr. Victor Mitchell, Architect, Aberdeen, has been adopted for the fountain which is to be erected at Roseheart in commemoration of the Diamond Jubilee. The structure is to be entirely of granite, and will stand over 10ft. in height. The lower base will be square, and the die will be circular and of polished Rubislaw stone, with turned base and pedimented cap of the same material, and having the following inscription cut in sunk and gilded letters:—"Victoria Regina, 1837, sixty years, 1897." The pillar and capital will be of Peterhead granite, polished, and the whole will be surmounted by an imperial crown, also of Peterhead granite, finely finished. Two of the pediments are to be enriched with coats-of-arms cut in relief. The burgh arms are to be cut on the front pediment, and on the opposite pediment will be the arms of Mr. Dingwall-Fordyce of Brucklay. There will be two drinking basins of Peterhead stone, and also a trough for horses and a couple of dog drinking basins. Messrs. Smith and Taylor, Ashvale Place, Aberdeen, are the contractors for the work.

**SMETHWICK.**—A new Wesleyan Church, which has been erected in Waterloo Road, Smethwick, was opened a few days ago. The Church is built upon a site fronting Waterloo and Sycamore Roads, and is in the Early English Gothic style of Architecture. It is constructed of brickwork, with stone dressings, the interior walls being finished with plaster (coloured a neutral tint) and stone, the window reveals being finished with parian cement and the roofs covered with red tiles. The main entrance-porch faces Waterloo Road, and consists of a moulded stone archway with stone columns having moulded caps and bases, and a stone carved pediment. A similar and separate entrance situated in the tower, and immediately adjoining, gives access to the gallery by a conveniently-arranged staircase. The plan of the Church consists of nave, with lean-to aisles and chancel, in which seats are arranged for the choir. The organ-chamber is placed on one side of the chancel, and the ministers' vestry upon the opposite side; also

the choir vestry. The Church is about 90ft. in length, 45ft. in width (inclusive of aisles), and 31ft. high. The seating accommodation is for about 650 persons. The building is well lighted by side aisle windows, and on each side of the nave above the arcading are arranged clerestory windows, while over the gallery are arranged two three-light windows, with moulded stone mullions and tracery, with wheel-tracery window above the same. The oak pulpit is octagonal on plan, and has rich tracery panels. A leading feature of the exterior is a graceful stone spire springing from a tower situated next the main entrance, and rising to about 80ft. in height. The interior woodwork is of pitchpine and red deal, stained and varnished; the roofs of nave, aisles, and chancel, all of which are open-framed, being oil-stained. The ventilation is efficient, and the heating, upon the low-pressure system, is by Messrs. Hoden and Son. The wrought-iron fencing and gasfittings have been carried out by Mr. Edwin Glover, of Dudley Road. The stained glass throughout has been supplied by Mr. T. H. Yates, of High Street, Smethwick. The builders were Messrs. J. Harley and Son, of Rolfe Street, Smethwick; and the Architects are Messrs. Ewen and J. Alfred Harper, of Colmore Row, Birmingham. The cost of the structure is about £3500.

**YEOVIL.**—The foundation stone of the Catholic Church of the Holy Ghost, which is now in course of erection, was recently laid. The edifice is being built within the walls which enclose the Presbytery, the Avenue, Higher Kingston, and is estimated, when completed, to seat between 250 and 300 people. The Rev. Canon Scoles, the rector of the Church, is also Founder and Architect.

When the Liverpool Stock Exchange was built, the Architect, Mr. Henry Sumner, and members of the organisation, endeavoured unsuccessfully to secure the strip of property running along the east side of Exchange Street East. They have at length acquired this valuable frontage, and the existing property is already in course of demolition.

The premiated drawings of the Royal Institute of British Architects selected for exhibition in the provinces have just been on view at the School of Art, Princess Square, Plymouth, under the auspices of the Three Towns branch of the Devon and Exeter Architectural Society. The collection has been further augmented by twenty-five sheets of studies submitted by candidates for admission to the Institute examinations 1896. These include seven sheets by Mr. H. L. Anderson for the intermediate examination, and five sheets respectively by Messrs. A. G. Bond and G. W. Fraser, and eight sheets by Mr. C. S. F. Palmer for the final examination.

The New Brighton Tower Company opened its grounds to the public on Whit-Monday. The general scheme is by no means completed. The leading feature is the colossal Eiffel Tower, which will be 600 feet in height. The basement will be occupied by a vast circus ring, around which 3000 seats for spectators will be placed. Upon the next floor will be the large ballroom, with a floor to accommodate 4000 people. Above this, the next floor will be devoted to gardens and ferneries, and here the main lifts will start for the top of the tower, being served from the basement by nine other lifts for the conveyance of passengers to the ballroom and roof gardens.

The idea of connecting the Great Northern station at Finsbury Park with the City by means of an underground electric railway to Moorgate Street was brought forward with the strong approval of the Great Northern Company in 1894, but owing to the death of the contractor, Mr. Williams, the scheme fell through. Now, however, Sir W. Pearson, Bart., M.P.; the constructor of the Blackwall Tunnel, has agreed to take the contract, and to accept in part payment the whole of the deferred shares amounting to £750,000. A Select Committee of the House of Commons has passed the preamble of the amended Bill granting the company an extension of time to June, 1902, for the acquisition of land and the completion of the works.

## Enquiry Department.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—An Architect gave me five days to make a perspective in pen and ink of three small villas of fanciful design and plan, stating he wanted to submit to the Royal Academy. My information comprised a ground plan and front elevation of villa No. 1, and the same for villa No. 2, and plans and elevations of villa No. 3, which was to be slightly altered and reversed on plan as shown by a photo also provided of it. I had no site plan, no roof plan of any of them, and no side elevations of Nos. 1 and 2. He declines to pay my account, stating the perspective is incorrect and inaccurate. He also states he gave me instructions to show a view directly opposite to what I have given him, which is not true. I enclose correspondence for reference, also a preliminary sketch of the drawing referred to on a smaller scale, also the specimen of my design and draughtsmanship submitted to him in my letter of terms, testimonials, &c. His first communication referred to competitions at Folkestone and at Dudley, which came to nothing as far as I am concerned.—I am, yours faithfully, F. O. F.

We have carefully examined the correspondence submitted to us. It is always a pity to be obliged to take such matters into Court, and we think arbitration by the Editor of a professional paper preferable. Before doing this, it would be necessary to have the facts of the case agreed to by both parties, in order to present to him a definite issue. The issue in this case would seem to rest, first, on certain facts which should be capable of proof, viz.: (1) Does your perspective agree with the drawings supplied to you as far as they go? (2) Were sufficient drawings supplied to you to make a complete perspective? (3) Were definite instructions given to you as to the point of view required? Secondly, this issue would seem to rest on a matter of professional custom, viz.: What licence is usually allowed to a draughtsman in such cases and under such circumstances? There would seem to be no dispute as to the artistic value of your work, or as to the amount you charge, but simply as to whether your perspective is an accurate representation of the buildings. On the first point, no one could arrive at a decision without seeing the perspective and the drawings supplied to you. On the second point we consider that a ground plan and front elevation alone are not sufficient information from which to make a perspective of a building of this class, and we see no contradiction in the correspondence of your statement that this was all you had to work from. On the third point we see no instructions in the letter as to the point of view. But the letter of instructions dated March 19th is incomplete, and such instruction may have been in the missing half. However we see no contradiction of your statement that you received no such instructions, so the presumption is that you did not. With regard to the matter of professional custom, we are of opinion that, considering the purpose for which the drawing was intended, and the short time in which it had to be done, that you were justified in interpreting the drawings to the best of your ability. But had there been plenty of time, you should have written for further particulars and more definite instructions. As a general rule, what is wanted in drawings for this purpose is more a pleasing picture than an exact representation of every feature as it is. As you had so little information, the presumption is that such was required in this case; had more been required, more information should have been given. This is a matter, however, on which the arbitrator would have to use his own judgment, taking all the circumstances into consideration, and judging the case on its merits. If you have both agreed, as seems to be the case, to submit the matter to arbitration, the important thing would be to also agree as to the exact number of drawings you received to work from, so that they could be submitted to the arbitrator with the perspective as a fact about which there is no dispute. He would then have some-

thing definite to work on. If you are prepared to substantiate your statements, and are also confident that your perspective is reasonably correct, we should advise you to proceed to arbitration at once, for so far as we are able to judge from the correspondence you have a clear case; as it must not be forgotten that in engaging the services of a professional man his charges have to be paid, though his work prove unsatisfactory—of course, within reasonable limits. In this case your correspondent himself would expect to be paid his charges on these houses, even though his client complained that they were absurd and not according to his instructions. We think that the fact of your drawing not being acknowledged, or your letters answered for three weeks, weakens your opponent's case, particularly as the date of this acknowledgement is after the rejections from the Academy Exhibition are announced.—ED.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would you kindly inform me, through your Enquiry Department, the best method of preserving pencil sketches.—I remain, yours, &c., A. M.

The best method of preserving pencil sketches is to use "Fixative," which is a colourless medium sold by all artists' colourmen. A spray is provided as a rule with the "Fixative," and full instructions given. By using this medium the pencil or crayon will not rub, and the drawing is in no way injured.—ED.

J. ARMITAGE.—The reply to your enquiry has been sent you by post.

CLERICUS.—This enquiry is held over until next issue.

## SOCIETY MEETINGS.

### British Archaeological Association.

An interesting ceremony took place at the last Council Meeting of this Association for the session 1896-97, the occasion being the presentation to Dr. W. de Gray Birch of an address and testimonial from some of the members and friends on his retirement from the post of hon. secretary and Editor of the Journal of the Association. The Marquis of Bute, vice-president, occupied the chair, and in a few well-chosen and appropriate words, expressive of his interest in the science of archaeology and his long friendship with and appreciation of Dr. Birch, handed him the gift, which took the form of a handsome gold demi-hunter watch. Dr. Birch suitably replied. It may be interesting to mention that Dr. Birch has laboured with the British Archaeological Association for upwards of twenty-two years, being a most indefatigable hon. secretary and untiring editor of the Journal, which may be said to comprise, in twenty-two volumes, which mark his period of service, notice of all that has in a prominent form transpired in archaeology. At the evening meeting, Mr. Thos. Blashill, hon. treasurer, in the chair, a large collection of rare and beautiful miniatures was exhibited by Mr. B. Nathan, many of which were of historical interest. A paper was read by Mr. Patrick, hon. secretary, in the absence of the author, Mr. T. Cann Hughes, on notes from North Lancashire, in which the ancient charters of Lancaster and the borough seals were described, and the fairs which were formerly held there and other local customs, some of which are now obsolete, were related. The earliest existent document is that of John Earl of Morton, dated 1193. The Mayor's seal of the borough is believed to be of the reign of Henry IV. or V., and bears in its centre three towers, each triple turreted, with a lion passant and gaudant crowned with a fleur-de-lis. The ancient stocks of the town are preserved at the Town Clerk's office, together with an interesting series of ale and spirit measures, which are said to have been made from guns captured from the Spanish Armada. There are very many ancient door-heads in and about Lancaster, some of them having various de-

signs of fish and other emblems. The Rev. H. J. Dukinfield Astley, M.A., the newly-appointed hon. secretary and editor, was introduced to the meeting.

### Glasgow Architectural Association.

The annual business meeting of this association was held in the rooms, 187, Pitt Street, Mr. Wm. Tait Conner, president, in the chair. The secretary's and treasurer's reports were read and unanimously approved. The following were elected office-bearers for the ensuing session: Mr. Jas. A. Morris, hon. president; Mr. Wm. Tait Conner, hon. president; Mr. John Fairweather and Mr. Geo. S. Hill, vice-presidents; Mr. Chas. E. Whitelaw and Mr. Jas. Salmon, hon. joint secretaries; Mr. Robert J. Walker, hon. treasurer; Mr. Hugh Dale, hon. librarian; general committee, Mr. John Arthur, Mr. Walter Tucker, Mr. Alex. Wingate, and Mr. Alex. McGibbon. The travelling studentship prize for 1896-97 was awarded to Mr. George Edward Walker.

### Northern Architectural Association.

The directors of the Leeds Steel Works, Limited, having invited the members and practising associates of the Northern Architectural Association to visit their works in order to view the manufacture of steel in its various processes from the ore to the finished girder, a large number of Architects accepted the invitation. The Leeds Steel Works received its present title and was registered as a limited company in 1888, but previously was known as "The Airedale Iron and Steel Works." Mr. Walter Scott, of Newcastle-on-Tyne, has purchased from time to time the property of the other partners, and he may now be practically termed owner of the works. The company has agents in all the principal cities of the kingdom, and forwards goods throughout Great Britain, to the British colonies, South America, India, Egypt, &c. The works cover an area of twenty-five acres; the yearly output is 70,000 tons of steel, and the wage roll amounts to £70,000 per annum. The stocking ground is commanded by a 10-ton travelling crane, which has a span of nearly 100ft. The sheds and yards are intersected by railway lines, on which six locomotive engines and eight steam travelling cranes are continuously at work. The electric light is in full use throughout the night. Among those present were:—Messrs. H. G. Badenoch, E. Bowman, P. L. Browne, J. Bruce, J. T. Cackett, C. S. Errington, E. J. Hansom, W. E. Fenwick, W. S. Hicks, W. H. Knowles, E. F. W. Liddle, C. T. Marshall, J. Oswald, S. Piper, F. W. Rich (president), J. W. Rounthwaite, and A. B. Plummer (hon. sec.).

### Association of Municipal and County Engineers.

The annual North Wales district meeting of this Association was held on Saturday, June 12th, at Llandudno, the President (Mr. Francis J. C. May, Brighton) presiding. The proceedings were commenced at eleven a.m. in the Masonic Hall, where an official reception was given the Association by the Chairman of the Urban District Council and acknowledged by Mr. May. A paper on "Llandudno Municipal Works" was then read by Mr. E. Paley Stephenson, engineer to the Council. The past, present, and contemplated works of water supply, sewerage, roads, scavenging, lighting, &c., were dealt with in the paper in an interesting and useful form, and at its close a discussion followed, in which the President and Messrs. Boulnois, Liverpool, and Platt, Rochdale, took part. The members afterwards proceeded in brakes, *via* Conway, to Penmaenmawr, on a visit of inspection to the famous granite quarries of Messrs. Darbishire's, Limited. Under the lead of the principal of the firm, Mr. Charles H. Darbishire, the visitors were shown over these very extensive works, commencing at the lower end—the point of delivery by rail and sea—*via* the stone breaking mills, and finishing at the summit where a large blast displacing some 1500 tons was witnessed. A sumptuous luncheon, provided by Mr. Darbishire, at Plas Mawr, was afterwards partaken of.

We hear that Mr. F. C. Penrose has resigned his position as Surveyor of St. Paul's Cathedral.

## Trade and Craft.

### TUNNELLING ST. GEORGE'S CHANNEL.

Belfast Chamber of Commerce is asking for a Parliamentary inquiry as to the practicability and usefulness of a tunnel between Great Britain and Ireland. It is contended that the methods of boring have been so cheapened of late years as to bring this old project within the bounds of financial possibility, if the Government will assist it with a guarantee of, say, 2 per cent. per annum. The cost has been estimated by a number of engineers at from six to eight millions sterling, and if this be doubled, by way of providing against emergencies, the Treasury, on the basis suggested, would have to provide £240,000 a year if the undertaking did not yield any profit. It seems to have been advised that the tunnel should run between Larne, in county Antrim, and Portpatrick, in Wigtownshire, a distance of 22½ miles. Whether any engineer has examined the strata of the sea bottom here we do not know; but the levels at all events are easy. Another 10 miles of approach tunnels would need, however, to be constructed; and if the boring were done at the rate achieved in the Arlberg Tunnel, it must occupy, at the very shortest, more than 13 years. This duration, great as it is, might be extended to a generation if adverse conditions were encountered.

### THE LONGEST TUNNEL IN THE WORLD.

Two gangs of workmen recently started digging in Colorado the longest tunnel which it has ever been attempted to construct. The main bore will be twenty miles long, and connecting with this are subsidiary tunnels with a total length of thirty miles. The starting point of the main tunnel is at the foot of the mountain leading up to Pike's Peak, near the old town of Colorado City. This point is but a short distance from the railroads which span the country between Colorado Springs and Manitou. From here it runs almost due south-west. The further end of the tunnel is at the edge of the mountains at Four Mile Creek, over in Freemont County, Col., six miles south of Cripple Creek, and near the little town of Sunol. The main tunnel will pass directly under the cone of Pike's Peak at a depth of nearly 7000ft., and 2700ft. beneath the town of Victor. Its average depth from the surface will be 2800ft., and it is designed to test the mineral deposits of the territory at these great depths. Thirty miles of laterals are contemplated, and these will pass underneath all the Cripple Creek district at an average depth of 2800ft. A thousand mines are to be made tributary to this vast system. Under present circumstances the distance, the shortest way, from Colorado Springs to Cripple Creek is fifty-four miles. By way of the tunnel the two cities will only be sixteen miles apart. The total probable expense of digging the tunnel and its subsidiary branches is 20,520,000 dols.

### A NEW SYSTEM OF ROCK-BLASTING.

A successful experiment in blasting has been made with a new system of rock drilling. Mr. Alexander, the road surveyor to the County Council of the Lower District of Renfrewshire, was present, accompanied by a number of surveyors interested in the test. The quarries are situated at Craigenfeoch, at the base of Gleniffer Braes, and the new patent boring machinery had drilled about a dozen holes in the rock to the depth of 14ft., all of which were electrically connected. At a distance of 300ft. Mr. Alexander made the electrical connection, and an instantaneous explosion was the result. On examination the operation was pronounced a decided success, and it was estimated that about 2000 tons of rock had been dislodged.

### THE ELECTRIC LIGHT AT CROYDON.

To meet the large and constantly increasing demands for electric light at Croydon, the Corporation has decided to extend the present plant and stations. The number of

lamps connected at present is equivalent to about 6600 of eight-candle power, and there are about 4000 further applications, making a total of 10,600. It is estimated that by December next the number of lamps will be increased to 12,000, and that at the end of 1898 there will be 10,000 more lamps to supply than at the end of the present year. Meanwhile, the Council has decided to apply to the Local Government Board for sanction to borrow a further loan of £5500, in order to cope with the public demand for the light.

### A NOVELTY IN ELECTRIC LIGHTING.

A feature of the Royal Palace Hotel extension, to the opening of which we referred in a recent issue, is a novelty in electric lighting in the banquet hall. This very pleasing innovation has been carried out by Messrs. Donison, Berlyn, Sillem and Co., of 116, Great Portland Street, W., to the specification of Mr. Adrian Collins. Some hundreds of 16-candle power lamps are completely hidden under the cornice, and the light is reflected on to the ceiling, and from thence thrown off into the room, the result being very beautiful, as a daylight effect is obtained without its being seen from whence it comes. We understand that the same firm has already received instructions to carry out a similar treatment in a mansion in the West End of London.

The Croydon Corporation is about to apply to the Local Government Board for sanction to borrow the sum of £32,000 for the construction of new waterworks at Waddon, where boring operations have recently been carried on with great success.

A new bridge connecting Norfolk and Lincolnshire has been erected over the River Nene, at Sutton Bridge, near Spalding, by the Midland and Great Northern Joint Railways. It is an iron swing bridge for both road and railway traffic, and, with contingent alterations at Sutton Bridge, will cost the railway companies a sum approaching £100,000.

While a landowner of Sens, in France, was superintending the digging of a trench, a large number of vases, sarcophagi, and very fine mosaics were discovered. Half a dozen urns filled with gold and silver coins, all bearing the effigy of the Emperor Constantine, were also brought to light. Just fifty-four years ago a similar discovery was made in this district.

## TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

**BRIDGNORTH.**—For erecting new schools, Highley, for the Highley School Board. Messrs. R. Scrivener and Sons, Architects. — £2,500 0 T. Morris £2,250 0 W. Swain 2,450 0 J. Sheppard & Son, 2,287 0 H. Farmer 2,447 0 Stourport\* 2,287 0 R. Thompson 2,462 10 Bradney and Lloyd 2,198 0 H. Smith 2,370 0  
\* Accepted subject to the approval of the Education Department.

**BRENTWOOD.**—For alterations and additions to "The Essex Arms Hotel," Brentwood, for Mr. Mersham. Mr. J. E. Pinder, Architect, Bridge House, South Tottenham, N. — £1,590 Green and Smith £1,539 G. E. Todd 1,543 H. Knight and Son 1,543

**BRIGHTON.**—For wood paving, &c., New-road and part of North-street, for the Town Council. Mr. F. J. C. May, C.E., Town Hall, Brighton:—

	Providing and laying 9in. by 3in. Jarrah wood blocks on 7in. Portland cement concrete foundation, including excavation, running-in joints, covering, &c., the whole complete.	Providing and laying 9in. by 3in. Karri wood blocks on 7in. Portland cement concrete foundation, including excavation, running-in joints, covering, &c., the whole complete.	Providing and laying 9in. by 3in. Swedish deal wood blocks on 7in. Portland cement concrete foundation, including excavation, running-in joints, covering, &c., the whole complete.	Providing and laying 9in. by 3in. Swedish deal creosoted wood blocks, on 7in. Portland cement concrete foundation, including excavation, running-in joints, covering, &c., the whole complete.	Supplying and laying extra concrete, composed of one Port and cement to six clean shingle, including excavation for same.	For any other kind of wood.

## CONTRACTS OPEN.

### HACKNEY UNION.

#### ALTERATIONS AND EXTENSIONS TO THE MASTER'S OFFICE.

The Guardians of this Union invite TENDERS for making certain ALTERATIONS AND EXTENSIONS to the MASTER'S OFFICE at the Hackney Union Work-house, situate at Homerton, in the County of London.

Persons desirous of Tendering may inspect the Premises, and obtain specification, conditions of contract, and form of Tender, by applying to me between the hours of TEN in the forenoon and TWELVE noon. No Quantities. The Contractor will be required to give approved security for the due performance of the contract.

Sealed Tenders, endorsed "Extension of Master's Office," must be delivered at my office not later than TEN a.m. on WEDNESDAY, JUNE 23rd, 1897.

The Guardians do not bind themselves to accept the lowest or any Tender.

By order,

FRANK R. COLES,

Clerk to the Guardians.

Clerk's Offices, Hackney Union,  
Homerton, N.E., June 9th, 1897.

### TO BUILDERS and CONTRACTORS.

Persons desirous of TENDERING for the various works required in the ERECTION of new KITCHEN WING, CLASS-ROOMS, DRAINAGE, &c., at the Grammar School, Pocklington, are requested to send in their names to the Architects, Messrs. DEMAIN and BRIERLEY, 13, Lendal, York, on or before JUNE 22nd, when bills of quantities will be ready.

THOMAS ROBSON,

Pocklington, Clerk to the Governors,  
June 8th, 1897.

## TWEEKSBURY RURAL DISTRICT COUNCIL.

### PARISH OF BREDON.

#### TO CONTRACTORS AND OTHERS.

The above Council invite TENDERS for the following WORKS and MATERIALS:—

1. For Excavating, Laying, and Jointing about 3881 yards of 12in., 9in., and 6in. Pipe Sewers. For Constructing the necessary Manhole and Inspection Chambers.
2. For Providing and Delivering the Glazed Stone-ware Pipes to be used in the above works.
3. For Laying and Jointing about 4,384 yards of 3in. Water Main, and Fixing the requisite Fire-cocks, Sluice Valves, &c.
4. For Providing the Cast-Iron Water Mains for the above work.
5. For Providing the Firecocks, Sluice Valves, and Fittings.
6. For Constructing the two Covered Reservoirs.

Plans, specifications, and conditions may be seen on application to the Engineer, Mr. JAMES VILLAR, 1A, Cambray, Cheltenham, and copies of quantities obtained on deposit of £2 2s. for each copy, to be returned on receipt of a bona-fide Tender.

The Council do not bind themselves to accept the lowest or any Tender.

Each contractor will have to enter into a bond with two approved sureties, or an approved guarantee society, in such a sum as the Council shall decide, for the due performance of his contract.

Tenders must be sent to me, the undersigned, on or before JUNE 28th, and to be endorsed "Bredon Tender."

H. A. BADHAM,

Tewkesbury, Clerk to the Council.

June 2nd, 1897.

## WORKHOUSE PLANNING.

(Continued from page liv.)

By GEORGE H. BIBBY, F.R.I.B.A.

### No. V.—WARDS FOR IMBECILES.

THE building requirements of the Local Government Board as regards accommodation for lunatics and imbeciles in workhouses are far less exacting than those of the Commissioners in Lunacy for patients in county asylums: the result is that patients, being maintained at a less cost in workhouse lunatic wards, are not infrequently permanently kept there, whereas they would be better provided for in a county asylum. This appears to be particularly evident in Ireland, as may be seen from the reports of the Irish Inspectors of Lunatics.

The buildings for pauper lunatics, until fifty

made for the simultaneous accommodation of persons of both sexes, with their attendants. In large workhouses provision for the reception of short-period lunatics may in some cases be suitably provided in connection with the wards already set apart for lunatics; but in the smaller workhouses it may usually suffice to so arrange two wards and an attendant's-room with padded-room, that one of the wards may, if necessary, be entirely shut off from the other portion for the joint use of a patient and attendant.

The wards should be large enough for at least two beds, to enable a person in charge to be in constant attendance, and the amount of space allowed should not be less than 100ft. superficial and 1200 cubic feet for each bed; all sharp projecting angles should be avoided, the floors should be of wood; ledges, architraves of doors, internal window sills and the like should be avoided; no brackets, pegs, or nails, &c., should be fixed to the walls; door handles

tion and all arrangements for the comfort of the occupants, they should be regarded and treated as sick wards.

The requisite minimum space per head for this class of inmate, is, in the dormitories, 5ft. of wall space (irrespective of doors and fireplaces); 50ft. of floor area, 10ft. in height, and 500 cubic feet are required. In these arrangements generally the requirements of the Local Government Board are below the standards of the Commissioners in Lunacy, and of the corresponding authorities in Scotland and Ireland; but for this difference there does not appear to be a satisfactory justification, the inmates of county asylums and of workhouse lunatic wards being alike dependent upon the ratepayers. Due provision must be made for securing cleanliness of person, and for the supply of hot and cold water; but in many cases a portable bath used in the ward would be a suitable provision.

In some workhouse establishments the

Fig. 6.

years ago, were usually inadequate for the purpose, both as regards construction and number, and vastly different in every way (and particularly as to management) to those now provided in the British Isles.

There can be no doubt that the local authorities had a great objection to all such institutions, as only causes of expense to the ratepayers, and frequently permitted the insane to dwell where they could.

In the planning of wards for harmless lunatics, and imbeciles under workhouse control, there are various points to which the Local Government Board have directed attention. In the first place, it must be borne in mind that in a large workhouse there must be some accommodation for "short-period" lunatics, and provision should be made in workhouses for the accommodation of persons who are alleged to be, or who are, lunatics, and who are removed to the workhouse under the provisions of section 20 or 21 of the Lunacy Act, 1890. The extent of this accommodation will depend upon the requirements of the particular union; but arrangements should be

should be sunk flush, and doors arranged so as to open outwards. For wards of this kind strong window frames with vertical swing sashes 6in. wide, extending for nearly the whole height of the window, glazed with small panes of stout plate-glass, and working on pivots at top and bottom, are suitable. Artificial light should be furnished from the adjoining attendant's room through a fanlight glazed with  $\frac{1}{2}$ in. plate, and under the control of the attendant, whose room should command a view of the whole ward by a small window of similar strength. Ventilation and warmth should be provided in wards of this kind by an air-chambered grate in the attendant's room, passing fresh-warmed air into the wards. Air-bricks should be fixed also in suitable positions in addition to the opposite external windows, which are indispensable in each ward. The wards for imbeciles should provide for the ready sub-division of the patients, according to their habits and condition, and should be so arranged as to afford the utmost facility for the constant supervision of the patients. And as respects ventila-

changes of nurses and attendants are not unfrequently caused by insufficient, unsuitable, or uncomfortable arrangements made for their residence, it is therefore desirable that every reasonable provision should be made by the workhouse Architect for the comfort and accommodation of the nurses and attendants, whether these be housed in the main asylum, near the wards, or in detached cottages.

Many of the workhouse lunatics and imbeciles are frequently very noisy at night, and unless the buildings be well planned, the attendants and nurses off duty are apt to suffer from loss of sleep; there is obviously less reason in a large workhouse, with spacious apartments for lunatics and imbeciles, than in a moderate or small-sized one, why the attendants should suffer in this respect, as special wards in the former instance are frequently provided for violent and noisy patients, whereas in smaller institutions all classes of officers, attendants, and patients are frequently brought into close contact.

It is desirable in all buildings set apart for the use of officials, attendants, and nurses that

the staircases should be constructed in a similar manner to those intended for the use of pauper inmates—that is, the flights should not exceed ten steps, there should be no “winders,” there should be a central newel-wall or other protection to prevent inmates from falling over, and there should be handrails on both sides, the possibility being borne in mind that a patient might wander from his ward and attempt suicide by throwing himself from the upper levels of the staircase, therefore there should be no open well-holes to the staircases, or otherwise railings should be carried up to the ceilings, even in the buildings for officials.

In many workhouses the accommodation for both officials and patients is still very defective and insufficient, yet matters in the “short period lunatic” wards, and in the imbeciles’ wards in workhouses, appear to compare very unfavourably with asylum accommodation generally, particularly as regards the floor spaces, heights, and cubic space permitted by the instructions of the Local Government Board, which allow in the day rooms a floor space of 20ft., a height of 10ft., and a cubic space of 200ft. for each inmate; whereas the Commissioners in Lunacy demand that the day rooms, of which there should be at least one to each ward, should afford not less than 40ft. superficial for each patient, not reckoning corridors of less width than 10ft. In ordinary asylums, where corridors of that or any greater width exist, the day rooms may afford only 20ft. superficial for each patient, it being understood that a space equal to 40ft. superficial be provided for each patient in the day rooms and such corridors combined. Mere passages of communication are not to be considered as corridors. In other respects, the constructional arrangements for imbeciles and short period lunatics are similar in most respects to those required for county asylums.

The requirements and suggestions of the Local Government Board state that the padded room may be most suitably fixed inside the attendant’s room, against an external wall, and in any case should be entered directly from that room. The padded room should have an area of about 63ft., exclusive of the space occupied by the padding. The padding (which may be of cocoa-fibre or other suitable material, and at least 4in. in thickness, covered with india-rubber or painted canvas) should extend to a height of at least 7ft. 6in. from the floor, and be capped with a strong slope fixed with screws, and sloping at an angle of about 30deg. from the wall, in order to afford no hold to a destructive occupant. The floor should be padded with cork chips, covered with india-rubber or painted canvas, so laid as to be thoroughly water-tight and washable, being commonly used. It is desirable to bed the floor on concrete or similar material to prevent damage either by vermin or dry-rot. Light may be provided by a small window of  $\frac{1}{2}$ in. plate-glass, fixed high up in the external wall. It should be furnished with a shutter either on the inside or outer side, so arranged as to lock into a recess when not in use. For artificial light a fanlight should be provided. The gas jet should be on a jointed bracket to turn away, and so as to be wholly out of sight of the occupant of the padded room when necessary. Ventilation may be provided for by air-bricks near to the wall plate, and by a strong grating in the lower 3in. of the door below the padding. When the padded room is wholly within the attendant’s room, the partition may stop about 2in. below the ceiling. Warmth in a padded room is a specially important matter, as inmates of this class are frequently inclined to strip themselves. When the padded room is not so situated as to share the warmth of the attendant’s apartment, means should be provided for passing into it warmed air either from a coil of hot pipes or from a chamber behind the grate in the attendant’s room, and through air bricks in the wall at a suitable height above the padding. A roomy approach, free from awkward angles and projections, is a most important desideratum for a padded room; the door, which should usually be about 3ft. wide, should open outwards to its fullest extent, so that the padding on it may not

diminish the clearway; the door should be so hung as to prevent any danger of crushing a hand or foot in the hinges when the door is being closed, and the fastening of the door should be by means of a snap-lock, with bolts near to the top and bottom respectively, and commanded by a single handle, and it may be desirable to arrange a supplemental drop-bolt in such a manner as to allow of a partial opening of the door for ventilation and inspection; two inspection slits, the upper one vertical and the lower horizontal (being for a lantern to light the floor where the gas jet may fail to illuminate it), should be provided in the door; these should be protected by strong plate glass, sunk so as to be beyond reach of a blow from the occupant.

In Fig. 6 is given the ground plan of a ward-block for imbeciles, &c. A is the entrance from the covered corridors leading to the main buildings, B passage leading to the imbeciles’ airing court, C a store closet, D a padded room which is approached through the attendant’s room at E; the day room is shown at F, and has a central fireplace at G; three wards or single rooms for noisy cases are provided at H H H, at J is another storeroom, K lavatory, L exits to yard and ventilating space, M panic stairs from dormitory on floor above, and w.c.’s.

Of all the improvements in the planning of workhouse wards for imbeciles and lunatics, none are so desirable as those which provide for buildings in which it is practicable for the officials to give such inmates a maximum of individual attention; large wards, whether in large or small asylums, are necessarily the most economical, but, at the same time, the least efficient means for the housing of the insane. By reducing the number of inmates of the wards, the troubles, occasioned by the noisy or violent, necessarily discomfort a reduced number of persons; if an imbecile patient be of filthy or objectionable habits, it is obviously desirable that he should be seen as little as possible by others than the officials. This question as to whether the workhouse wards for imbeciles and lunatics should be large must continue to be purely a financial matter, as regards institutions for paupers, and it is to be greatly regretted that in spite of the enormous sums expended upon modern workhouses in certain districts, it should remain quite impossible for the inmates in all cases to receive that careful attention which could only be given advantageously in rooms of moderate area, and by an adequate number of officials. The question as to how far it may be desirable for public authorities to take charge of all insane persons, both rich and poor, is one that is not unlikely to attract further attention, and there would appear to be no reason why, in such an event, the accommodation for imbeciles and lunatics in workhouses should be reduced to the lowest limits, and for the most temporary arrangement, and that all such persons should be kept and cared for in asylums where they would receive attention from specialists.

The disadvantages of large asylums or workhouses with large wards include difficulties of the officials connected with obtaining a complete knowledge of the peculiarities, dangers, wishes, and constantly changing conditions of the patients, both as regards their bodily and mental health; for even if the number of attendants and nurses be correspondingly increased with the number of inmates kept in large wards, yet the circumstance of mixing many imbeciles in different conditions of health and temper cannot but tend to militate against the prospects of good management, and to the detriment of those persons who only require quiet and careful observation and treatment in apartments of moderate area to perfect their restoration to mental health.

For those inmates whose mental condition does not prevent them from undertaking employment, one-story workrooms should be provided; but, wherever for sufficient reasons it is necessary that two-story buildings should be used for this purpose, the staircases and exits should be arranged as for other portions occupied by imbeciles and harmless lunatics; that is, every precaution must be adopted to

prevent the inmates from falling or throwing themselves down. Well-holes in such staircases would not be permitted.

(To be continued.)

## SANITATION AT BRISTOL.

IN the course of an exhaustive report on the health of Bristol, Dr. D. S. Davies, Medical Officer of Health, supplies the following information:—Bristol is completely sewered, cesspools are not countenanced, and no dry systems of disposal are in use. The aggregate length of the main sewers is about 150 miles, and the cost of construction, commenced in 1851, amounted to about £161,000. The sewers take all storm-water, which reaches them by way of trapped street gullies; they are without any external openings or special ventilating outlets, and the manholes are all closed down. In the low-level sewers provision has been made for flushing from the Floating Harbour, and double tidal valves are fixed at their outlet. These valves are of cast-iron, oval or circular, and self-acting, hung on chains, and bedded on indiarubber. The sewers are so designed and constructed with regard to capacity, fall, and position, that they may be ultimately

### CONVERGED TO ONE POINT,

from which an outfall sewer may be continued to a suitable point lower down the river, or into the Bristol Channel. The sewage is discharged without treatment into the tidal Avon, and the rapid scour of the tide, which in this channel is of exceptional force, generally results in the removal of the sewage without offence, although in remarkably dry summers, when fresh water is deficient in the river, some nuisance is complained of. These complaints were especially frequent during the exceptionally dry summer of 1896; and on July 23rd the question was referred for exhaustive consideration to a sub-committee. The nuisance is not only felt acutely at those points where the ferries cross, but is complained of in the houses by the residents on the river bank, and in three specific instances the occurrence of disease (one case of enteric fever, and two of septic mischief following parturition, but not notified in either case as puerperal fever) has been attributed to the effluvia from the river. Although there is no general excess of disease in the districts bordering on the New Cut, and although the water of the river is muddy and brackish, and therefore not used for drinking or domestic supply by any town or village within the tidal range, the very definite, persistent, and increasing complaints of nuisance from this cause must be allowed considerable weight. It is an elementary axiom that excremental matter should be removed as completely and as rapidly as possible from centres of population, and it would undoubtedly be more satisfactory to carry the sewage right away at once to the Bristol Channel (unless it can be efficiently and economically purified at some intermediate point before discharge into the river), than to allow it to discharge directly, as at present, into the river as it passes through the city. This must, however, be carried out as a complete scheme, dealing with the entire

### AREA OF LARGER BRISTOL,

and with the sewage of up-river towns; and it must not be forgotten that, when completed, there will possibly occur under certain conditions of temperature some considerable smell from the mud-banks, though freed of sewage, and that in very hot summers some occasional forms of illness may then, as now, be attributed to the condition of the river.—The erection of the permanent hospitals at Nover’s Hill and at Ham Green has made considerable progress. Hospital accommodation for the present city of Bristol will be adequately provided by the erection of 230 beds in permanent buildings, being in the proportion of one bed per 1000 population. Small-pox Hospital: Of these, eighty beds will be provided on the Nover’s Hill site for small-pox cases, together with adequate administration and laundry

buildings for the proper accommodation of a sufficient staff of nurses, and the efficient dealing with the clothes. Sixty beds are already provided, and the administration and laundry buildings are approaching completion; fifty-two of the beds are as yet provided only

IN TEMPORARY WOODEN BUILDINGS  
erected under pressure of the 1893-94 small-pox epidemic, and an isolation block of permanent construction provides for the isolation and observation of eight patients. The administration block and the laundry provide fully for the requirements of the full-bedded site. As these are now all but completed, the difficulties to all concerned in dealing with infectious disease in temporary wards, with imperfect bathing and laundry conveniences, and inadequate accommodation for a sufficient staff, will very shortly disappear. Fever Hospital: The 150 remaining beds for cases other than small-pox are to be provided upon the Ham Green site; together with the administration laundry, stabling and storage accommodation necessary for the efficient working of the hospitals. The administration building, the laundry, and stabling accommodation, and 76 of the 150 beds are already in hand, and when completed will provide, together with those on the Nover's Hill site, good instalments of that sufficient hospital provision in which the city has so long been lacking.

In his annual report on the sanitary condition of the borough, Dr. Wm. Iliffe (medical officer of health for Derby) states that further progress has been made with the condemnation of houses unfit for human habitation. "There are," he says, "hundreds of houses in Derby which are unfit to live in, but, by their simultaneous condemnation, greater difficulties would be created and much more suffering induced than exists under present circumstances." Under these difficulties the medical officer has considered it the wisest and most prudent course to condemn the worst of these wretched dwellings in a gradual, but sure way, so as to cause a minimum of inconvenience and loss to owners and tenants. The only other course that could be adopted, to be successful, would be Mr. Russell's idea of the municipality stepping in, and providing houses for the people who are displaced; and even this course would take time. Houses are required at rentals of from 1s. 6d. to 3s. per week, and such houses can only be erected without loss by "public bodies," who can borrow money at a very low rate of interest. Though no pecuniary profit could be expected, the gain to the general public would nevertheless be great by removing plague-spots, and so improving the health of the people and preventing epidemics of disease.

Surveying and Sanitary Notes.

THE ability of women as sanitary inspectors has been practically demonstrated in St. Pancras, Islington, Kensington, and other metropolitan parishes, where the vestries have deemed it wise and necessary to thus employ females. In a report just issued by the Health Committee of St. Pancras, it is stated that during the twelve months since a local female sanitary inspector was appointed, she has made 3071 inspections and 246 re-inspections. The committee, however, are of opinion that this cannot represent the total number of workshops where female labour is employed in St. Pancras, and believe that as time passes the number of these premises coming under inspection will continue to increase. The sanitary arrangements of shops where women are employed, the Committee advises, should be inspected annually by the female inspector. It further suggests that infants' and girls' schools (especially those conducted privately) should be inspected from time to time, and that this duty should also be undertaken by the female sanitary inspector.

OFFICIAL particulars have just been obtained respecting the discovery of defective drainage at Hounslow Barracks. It appears that the Hounslow District Council has been in communication with the War Office on the subject, with the result that the War Office has issued orders for the construction of an entirely new drainage system at the barracks, at a cost approaching £10,000. A preliminary investigation has disclosed so many defects that it has been found positively dangerous to go on with the works. By the direction of the War Office a board of officers has been convened, and it has reported that the circumstances are of the most serious character. The whole of the patients in the military hospital, numbering over 100, have been removed to huts erected on the west side of the barracks.

In an article on "London Street Scavenging," a contemporary declares that there is no capital in Europe in which the streets are in such a disgraceful condition as in London. The article continues:—"In the City proper, where street cleansing is properly the business of the Corporation, things are in so satisfactory a state that but little remains to be desired. But as soon as we leave the City boundaries and come into residential London we are plunged into anarchy. The worthy citizens, on their way to their business in the morning, have their nostrils offended by all kinds of noxious smells. Quaint-looking men with curious instruments, exaggerated copies of the implements the debt croupiers use at Monte Carlo, are seen hobbling about the roads

raking the mud and street refuse into heaps, which heaps are allowed to rot and fester by the hour under the benevolent germinating influences of the morning sun, until it suits the convenience of the huge open carts, for which our vestries have so great a partiality, to come along and leisurely take them away. In other capitals all this is done at night."

THE Select Committee of the House of Commons, of which Mr. Rankin is chairman, recently resumed consideration of the Bill which the Southwark and Vauxhall Water Company is promoting for power to take some 20,000,000 gallons of water daily in excess of the quantity—viz., 24,500,000 gallons—which they are now entitled to take from the Thames. This additional quantity, it alleges, is absolutely necessary to supply the present needs of their district, and the Company is already abstracting it. An injunction was, however, obtained by the Thames Conservancy Board in January last restricting them to the lesser quantity. In view of the great emergency of the case the Board consented to the suspension of the injunction to enable the Company to obtain the present Act, which was intended merely to carry the Company over till next session, and to leave it quite open for all matters of contention to be discussed. After hearing evidence, the Chairman said: The Committee is of opinion that the Water Company could not possibly carry out the demands of the petitioners in one year, which is the time this Bill would have to run, even if they were able to substantiate their claims, upon which point the Committee gives no opinion. Therefore, the Committee deems it inexpedient to further consider these petitions; and, as the matter is of great emergency, it finds the preamble of the Bill proved, with the condition that both the mode of taking the water from the river Thames and the quantity to be taken are to be treated in next year's Bill. It would suggest that it would be more convenient for the petitioners to raise their various issues upon next year's Bill.

At a recent meeting of the Aldeburgh Town Council another step was made in connection with the proposed sewerage scheme, Alderman Anderson moving that application be made to the Local Government Board for sanction to borrow £11,000 for sewerage works and sewage disposal. Mr. Anderson said it was doubtless in the remembrance of councillors that strong opposition was made to a sewage scheme when it was first introduced, the general impression being that the cesspool system was most suitable; but it had become increasingly obvious that a change was desirable, and that they would have to adopt a system of sewerage on modern principles. With a view of carrying out that idea they consulted Mr. James Mansergh, and he and his partner presented a report condemning the cesspool system.—It was agreed to apply for the loan mentioned.

### Design at the Architectural Association.

THERE has lately been on exhibition at the premises of the Architectural Association in Great Marlborough Street, a collection of drawings which comprehend the work done during the past session in that "School of Design" which the Association has made one of the features of the educational course it inaugurated some five years back. The School in question also concerns itself intimately with the material used in the designs of its classes, the object of the School being to train students of Architecture in the nature and capabilities of the materials with which they have to deal, and their methods of manipulation. To this end classes are held in various workshops, and lectures and actual demonstrations given of the uses and limitations of stone, wood, lead, and plaster, and other materials of the builder's craft. The knowledge thus gained it is intended should be applied in the designs made in the studio. The lines upon which the students are directed are eminently practical. Finished drawings are not required or expected, but there must be plan, section, and elevation, and, however roughly indicated the various parts of the design must be thoroughly worked out, or, to use a phrase of the drawing-office, the designs must "work." The texts or maxims which are accentuated in the School yet further explain and emphasise its scope and intention. They are: *Simplicity of treatment*; *Accuracy of construction*; and *Economy of labour and material*. In viewing the drawings, we were much struck by the subordination, both in amount of work and, indeed, in quality also, of the advanced class to the elementary. Only five students exhibited their designs, and of these not one had attempted all the subjects set during the session. The oak choir screen, the subject set by Mr. Reginald Blomfield, was particularly disappointing. Although all the students who exhibited designs had elected the forms of the Renaissance rather than those of the fourteenth or fifteenth century, there was no inspiration from the City Churches, as might have been expected, nor, it would seem, from anywhere else. Mr. P. B. Chatwin's branch bank, however, shows promise, and we should be glad to see it in actual brick and stone in the High Street of some county town; and Mr. W. A. Waddington, under the criticism of Mr. Ashbee, has produced a bronze font in lines of considerable grace, and he has, moreover, designed in and eulogised the metal, and not adapted from a form conceived in stone, as is so frequent an error; the poise, and the curves, and the details and mouldings proclaim it metal in every part. Mr. G. C. Carter has yet to learn that a man cannot fitly express himself till he has learned a language in which to do it. We hope Mr. Carter will learn to express his ideas some day, because he seems to have ideas. The method in the elementary class of Design has been somewhat different. One subject was set, that of a small Church to seat about one hundred persons, situated upon the rocky slopes of a Westmoreland hill, and the various parts of the building were the subject for separate classes and workshop demonstrations by different visitors. Thus the drawings in this class

consist in but one design, fully detailed in all particulars, and, indeed, in some cases enough working drawings seem to have been made to fully explain the design and direct the various trades. This strikes us as a very happy and ingenious way of utilising the educational possibilities of a School of Design to the full. Among designs executed by very young students, some of them but boys of eighteen or nineteen, and none of more experience than can be acquired with the twenty-third or twenty-fourth year, it is only to be expected that a great deal of the work would be tentative and inept; but what we

remember that the work is done under the intimate criticism and advice of Architects of reputation; but when we notice the latitude—nay, almost *luxury*—of style allowed in the school, we see at once that the instruction tends to inspire rather than mould and restrain, and so it should be. The fault of the designs—and the fault was in degree common to all—was an incomplete mastery of the requirements and environment of such a Church, and a latent intention in the designer to express himself, his pet fads, fancies, and forms, in a Westmoreland mountain Church, rather than to express a Westmoreland

IN CORDOVA. FROM A SKETCH BY A. N. PRENTICE.

remarked was not the preponderance of these tokens of youth and inexperience, but the striking force and conviction of the designs, albeit the drawing was in many cases feeble, and in many more instances the ideas were inadequately expressed. On the whole, however, the work was very promising, and, what is perhaps more inspiring, there were lots of it; the sheets of details were in many cases lavish. Of course we must

remember that the work is done under the intimate criticism and advice of Architects of reputation; but when we notice the latitude—nay, almost *luxury*—of style allowed in the school, we see at once that the instruction tends to inspire rather than mould and restrain, and so it should be. The fault of the designs—and the fault was in degree common to all—was an incomplete mastery of the requirements and environment of such a Church, and a latent intention in the designer to express himself, his pet fads, fancies, and forms, in a Westmoreland mountain Church, rather than to express a Westmoreland

English. Nor is Mr. J. C. Hawes of the soil, though there is a great fitness in his external elevations and his plan for a mountain Church in the abstract. What we object to in this design is Mr. Hawes' interior wood-work. It is inspired, it would seem, from the modern ingle-nook as purchased wholesale, although it is true to say that his proportions and dispositions are good. We saw at the late Arts and Crafts Exhibition a green oak chest with blue panels, and an orange tree (?) with three oranges (?) in each. We think Mr. Hawes saw it too; also a famous piano with garden gates to it. Mr. T. E. Abbott seems a clever young man, but still sowing his Artistic wild oats. His design is inappropriate, but shows a pretty feeling. Mr. C. L. Brierley shows a meretricious design, of considerable restraint and some power. His metal work detail of a hanging lamp also is a good design, and shows a right feeling for design in metal. The emu egg pendant does not strike us as quite appropriate to a Church, nor in particular to a Westmoreland mountain Church. It is somewhat, to borrow from Emerson, "A dragging together of the poles of the universe." We notice that Mr. Brierley has succeeded in placing his perspective of this Church in the Architectural Room at the present Royal Academy Exhibition. Mr. F. N. Reckitt, in our opinion, shows the best design. He has kept consistently to English forms, and shows restraint and a fitness with the sentiments of the environments. Mr. T. F. Green shows careful though unfinished drawings. His design is the most strictly true to tradition—that of the fourteenth century—than any of the other exhibits, and he has held consistently to it. He has worked hard, too, and we hope he will get one of the medals, of which two, a silver and a bronze, are to be awarded.

#### WINCHESTER COLLEGE.

THE memorial buildings at Winchester College were opened last week. The building, of which Mr. Basil Champneys is the much-praised Architect, is a long, low building standing in what used to be called Sickhouse Meads, and so admirably placed that it leaves the beautiful old structure of Sickhouse in clear view. In style it may be described as of the English Renaissance—a fairly comprehensive expression; and the appearance, supported as the main building is by a colonnade, is distinctly pleasing. The main peculiarity is to be found in the outside pillars, rounded, but with numerous square projections, which are so constructed that any active boy can readily climb up to the balconies without going through the formality of entering by the door. At the Sickhouse end is a niche with a statue of William of Wykeham. Then come four medallions showing busts of Grocyen, Ken, Seaton, and the late Earl of Selborne in a full-bottomed wig, and then a niche which holds a statue of the Queen. Part of the object of the authorities appears to have been to promote a taste for archaeological matters and for Classical and Medieval Art. Special attention also has been paid to Architecture, and there is a fine collection of bromide photographs, presented by Mr. Samuel Rawson Gardiner, of pre-Norman and Norman, Early English, and Decorated and Perpendicular buildings. There are also portfolios of photographs of pictures, Venetian and Florentine for the most part, though the English, French, Spanish, German, Dutch, and Flemish schools are not neglected. To Mr. Hardy, one of the masters, has been intrusted the section concerned with Wykehamical antiquities and pictures, which, already interesting, is sure to grow in strength. Below are all sorts of working-rooms. If a word of criticism be called for it is upon the question whether sufficient space has been devoted to the natural history section, having regard to the fact that Winchester and the neighbourhood offer a rich and varied field to the naturalist and the botanist.

#### THE ARCHITECT AS AGENT.

##### IMPORTANT LITIGATION.

AT Sheffield County Court, Judge Waddy recently tried the case of Moorwood, Sons, and Company, Harleston Works, Sheffield, ironfounders, v. George Longden and Son, of Neepsend, builders. It was an action of contract which had been commenced in the High Court of Justice, and had been remitted to be tried in the County Court. The amount sought to be recovered was £54 18s. 3d., a sum made up of various items charged for stoves sold on dates between August 5th and Nov. 12th last year.—Mr. Waugh, for the plaintiffs, said on Sept. 9th, 1895, Messrs. Longden and Son entered into a contract with the chairman and weekly board of the Sheffield Royal Hospital for the erection of certain buildings in the extension of the hospital. The Architects were Messrs. Hadfield, Son, and Garland, and Mr. Hadfield gave the plaintiffs orders to supply stoves, the cost of which was now sued for. It was well known that whenever an Architect ordered goods to be sent to works, he was ordering as agent and not as principal. Before the whole of the goods had been supplied the plaintiffs asked Mr. Hadfield whom they must charge for the stoves, and he replied "Messrs. Longden and Son." Before giving his certificate the Architect saw the defendants, who told him they would pay for the stoves, and on Dec. 23rd, 1896, he made out his certificate for £50 on account. The defendants had not paid.—Mr. Ellison, for the defendants, explained that his first contention was that the defendants were not directly liable for the goods. The order was given by Mr. Hadfield, on behalf of his principals, the weekly board of the hospital, and Mr. Hadfield was liable. It was a very important matter of precedent if a contractor was likely to be sued for things that were ordered by an Architect.—Evidence was taken, and his Honour, in giving judgment, said he had frequently expressed his amazement that contractors and builders could be found nowadays who were so stupid and helpless as to give themselves up with their throats wide open, to be comfortably and happily cut by the Architect. But they did. They made contracts which were the most astonishing it was possible to conceive, and by which they put themselves into the greatest possible difficulty, and his sympathies in those cases were largely indeed with the builders, and very largely indeed—he could not help saying it—against the tyrannical propositions of the Architects. But the Architect's answer to that was that it was the only way in which business could be carried on. They must have some one man invested with unfettered discretion. He (his Honour) was not there to express any opinion of a judicial character with regard to the matter. He did not know what had made the parties quarrel. They had not quite got at it. There was no grit in the machine when Mr. Longden agreed to pay on receipt of the certificate. Mr. Longden knew that if he paid the money he would simply take it from one pocket and get it back into the other from the hospital. His Honour suspected that the history of this action was to be found somewhere in the neighbourhood of the contra account which had been mentioned. The parties had been to law before, there was friction between them, and he thought one side was to blame as much as the other. He was of opinion that the defendants did undertake to pay for the goods, and he should give judgment for the plaintiffs for the full amount.

THE house of Balgriffin Park, between Raheny and Malahide, has been destroyed by fire. It was one of the oldest residences in the northern part of County Dublin, and the woodwork was of exceptionally heavy construction. Balgriffin is historically interesting as the estate conferred by Henry VIII. on Conn Bacach McNeill in 1542, when the King was engaged in an attempt to convert the Irish chiefs into noblemen. The mansion house dated from the time of Queen Elizabeth.

#### ARCHITECTURE AT LIVERPOOL.

THE annual Exhibition of selected works by the students of the City of Liverpool School of Architecture and Applied Arts during the past session was held last week. The exhibits include Architectural drawings and designs by the more advanced students, modelling from the life, designs for fabrics, wall-papers, book-plates, stained glass, posters, &c., and many charming and fanciful sketches submitted for the Sketch Club competitions. There are some specimens of wood-carving, and a few, but excellent, examples of wrought iron work. An example is afforded by what may be called the premier department—that of Architecture, which is under the direction of Professor Simpson, the principal of the schools. The collection of Architectural drawings not only shows good draughtsmanship, but a thorough grip of the practical as well as of the artistic side of Architecture, as evidenced by the treatment of working details. It is interesting to note the several groups of drawings illustrating the treatment of the same subject by different students. The subjects in this instance are a two-story façade in the classical style; a doorway in the same style with arched pediment; and a complete set of drawings and plans for a small country mansion. In regard to the department of modelling and sculpture, the main feature is the prominence given to direct study from the life. There is a modelled bust by Mr. L. Crosfield, showing insight into plastic effect, the work having a strongly marked character. The series of models of a figure adopted for a Telemones, and the half-dozen reliefs of a half-length female figure, a classical study for "Pandora," are instances of healthy emulation upon right lines. The reliefs and modellings of a more purely Architectural character are also interesting. The same practical view is uppermost in the exhibits of the students of decorative design and painting—that is to say, the object of the school as one of applied Art is obviously kept steadily in view by Mr. Anning Bell, since the designs are for friezes, wall-papers, posters, book-covers, cushions, hangings, and illustrations for periodicals and books, and are of a strictly applicable character, whether in black and white or colours. The black and white work predominates, and much of it is of distinctly fine quality. The following is the list of prize winners:—Modelling from the Life (Telemones): 1, A. H. Griffiths; 2, J. H. Morcom. Head from Life: 1, G. Crosfield. Panel Design: 1, A. H. Griffith; 2, W. Webb. Panel Design (special prizes): 1, R. Murray; 2, F. Wescott; extra prize, G. Shaw. Cast: 1, T. Rowan; 2, H. B. Bare. Drawing from the Life (day): 1, L. Crosfield. (Evening): 1, A. Jenks. Drapery: 1, R. Warrington. Set of Designs: 1, C. A. Walker, who also shows some plates, &c., designed and made by her for the Della Robbia Company; 2, E. Jackson. Design (evening): C. E. Prescott. Design of Ornament: 1, M. E. Carine; 2, G. Williams; extra prize, R. Roberts. Wrought Iron: 1, E. Barstow and J. Lowe (equal); 2, H. Vogt. Junior: 1, W. Hawthorne. The prizes in the Architectural department have not been awarded, the session in that subject being still in progress. Some important additions will be made to the classes of the school next session, which commences on Oct. 4. Amongst others, Mr. E. Ll. Rathbone will hold a class in copper and brass work.

THE Jubilee number of the "Newsagents' Chronicle" (William Dawson and Sons, 2d.) makes a useful contribution inside its pretty decorated cover to what may be called the journalistic retrospect of the Victorian era. In a series of special articles it reviews the Newspaper Press of the period, tracing a glorious progression, which, however, would never be interpreted by the magnificence—or lack of magnificence—of the buildings in which the newspapers of to-day are produced. There are, of course, one or two buildings which might be considered exceptions, but on the whole the "glories" of newspaper advancement are strikingly disassociated with Architecture.

## Architectural Epidemics.\*

Illustrated.

By HARRY BARNES, A.R.I.B.A.

QUEEN ANNE is dead, so are the great styles; the former died in 1710, the latter at an earlier date; they all did their duty in the station in which it pleased Providence to place them, and entered into their rest. Here, alack, the resemblance ends. Queen Anne, God rest her soul, sleeps placid and ignored, in death as in life, while the great styles, after the tender oblivion of an age, have been unearthed from their mouldering obscurity with results calamitous and grotesque.

There are few cases in which resurrection seems natural, and fewer still desirable. When that which is young, undeveloped, immature is destroyed, sometimes the wish goes round for the power to recall it from that undefined region into which it has passed; but when youth has become age, and age senility, when promise has become fulfilment, and fulfilment decay, there is no desire to perpetuate an existence which has, by the "unconscionable length of its dying," impaired most of the virtue of its life. To grant another life to a Chatterton, for example, one might feel to be a grateful thing, but to start a Methuselah on a second millennium seems in the face of it rather unnecessary.

And the great styles had their day. No malevolence of society or nature threw a spell across their paths from which they might, like the sleeping princess, wake to life and beauty at the touch of some coming age.

The ideas which bore them, and of which they were the most beautiful expression, passed through that strange inevitable experience of all their kind, in which they appear in turn as the hope and scourge of the world, and by some inexplicable sympathy, subtle as it was sure, the styles revealed the march of these ideas from their acceptance to their rejection, as a face will record the experiences of a soul from the cradle to the grave.

And they passed together, the ideas and the styles; full, round, and complete was the life of both, and also final.

The pagan idea at its best, so convincing of the union of mankind with the great engendering

power of Nature, an idea redolent of woods and fields, running water, and blue sky, so filled with the zest of open-air life, that I can never believe their temples had anything but open roofs, through which the sun and clouds might be seen like a jolly shepherd driving sportive sheep across great fields of blue. An idea, so evidently formed by happy, unconscious creatures, glad in the possession of the good brown earth, finding points of endless affinity between themselves and all the aspects of Nature, in bird, and beast, and flower; that one might well feel sad that such simple joys, and so simple a belief, are not for us; and sadder still, that all this should end in the thousand confusions, and follies, and senseless vices, of the last years of the pagan world. But how fittingly is the early faith expressed in the severity and simple beauty of the best periods of classic Architecture, and how tragically the squalor of its later days in the miserable remains of the later Empire of Rome!

And the Christian idea; with its gloomy consciousness of sin and its forebodings of the future, lightened by marvellous uprisings of faith, how vividly expressed by the cloistered gloom and up-darting shafts and spires of Cathedral and of Church, a fitness of expression maintained till the end, when the hardness, mechanism, and formality of Mediæval Christianity found its best type in the rigidity, perpendicularity, and stiffness of its Architecture.

Closely linked they were—these ideas and these styles—to both of them the vigour of youth, the maturity of manhood, the tranquillity of age, and, finally, the collapse of death.

No resurrection of them was possible—none, indeed, desirable; their work was done, their purpose accomplished, their decease had left the world free for other growth, and to both of them should have been the undisturbed seclusion of the grave.

This has, however, not been the case, for during the last hundred years a great number of persons, well-meaning, doubtless, but sadly misguided, have illustrated the truth of the little hymn, that "Satan finds some mischief still for idle hands to do," by ransacking the sepulchres of the styles, and exposing the world to the contagion of the vast quantity of decomposing remains which they have discovered there, and scattered to the furthest ends of the world.

So extensive and virulent have been the effects of their conduct, that, though in a flash of unconscious humour, the escape from the tombs of the decomposing essences of the styles has been termed a Revival, the true description of the age, and in this I am sure you will all agree with me, is that of an Age of Epidemics.

Fergusson attempts to make a distinction between the Renaissance and the Revivals, but I am not sure that such a distinction can be made, it rather appears to me that the spirit which made the Middle Age turn from its own proper form of expression to build after the manner of the Ancients, as Palladio quaintly puts it, was anything essentially different from any modern epidemic.

It was a first attack, and these are proverbially not so deadly; there were not the facilities for spreading it, and the world still had some remnants of robustness wherewith to throw it off; but it left its mark, and, as the revival of Greek philosophy monopolised some of the best minds of aftertimes in a vicious circle of barren reasoning, to the exclusion of practical science, so the Renaissance in Architecture infested men with an unnatural, unhealthy craving for bygone and effete forms that has ever since prevented the natural development of their ideas.

We can, however, limit ourselves to the present century and our own country, for in the history of its epidemics we have the history of a second Renaissance which may well be considered by itself.

By the end of the last century, the evil effects of the First Renaissance had worn themselves out, and the country was attaining to a healthy barrenness of Architectural form. The tremendous changes brought about by the industrial revolution were engaging the whole attention of the people, and making them happily forgetful of all their Architectural

\* Paper read before the Northern Architectural Association, Newcastle-on-Tyne.

absurdities, while our isolation from the Continent, due to the Napoleonic Wars (which Professor Banister Fletcher, with a curious inappreciation of the requirements of a new Architectural birth, seems to deplore in his recent history of Architecture) had cut us off from the principal, indeed, then, almost the only source of contagion. At this time a hopeful period for the future of English Architecture seemed to have begun.

Unfortunately these conditions did not last. The great increase in the wealth of the country, the growth of a new leisured class, imbibing all the false culture and aping all the extravagances of their predecessors, set the purveyors of Architectural novelties on their mettle to supply the new demands.

But the artistic vision was dimmed (by causes too deep for our time and space to discuss), and nowhere discerned a field in which the spirit of artistic Architecture might operate.

There was nothing for it but to rummage in the dust-heaps of the past, an action ever indicative of poverty, if not indolence. It requires abilities of a certain kind, doubtless, to plan the part of *chiffonnier* to the centuries, but they will scarcely rank with the qualities that, leaving the dead past to keep its dead, can wrest from the grasp of the present, or anticipate from the future the things desired.

I fancy if I were a woman I should not care to wear the necklace from a mummy's neck while there were pearls to be had fresh from the seas.

But in the early days of this century they knew of no "perilous seas" that were not already rifled of their treasures, and if they had, the art of diving was forgotten; there was nothing for it but the tombs. And they dwelt amongst them.

Their industry was remarkable. Not a tomb of note was left unvisited or unspoiled, and exhumation became a Fine Art, and body snatching the recreation of earls; the typical example of which being, of course, the acquisition (this is, I think, a sufficiently euphemistical term) of the Elgin marbles.

At first there was some fastidiousness in the choice of the remains. It must be Greek of a certain period if it was to win the approbation of connoisseurs, but this field was soon worked out, and while it was admitted that the older the remains, the more highly favoured and acceptable they were, yet it was soon felt that after all the main qualification lay in the fact that they were relics of something that had existed in the past. This greatly extended the area of operations. Roman remains were now felt to be worthy of attention, and Egyptian not altogether unprofitable.

For a time the supply of sufficiently decom-

posed Architectural remnants was sufficient to supply the demands of the cultured classes. Suddenly, however, some persons, either not possessing the requisite capital to open up Architectural graves in foreign countries, and envious of their more fortunate contemporaries, or else finding all the claims marked off, woke to the knowledge that there were actually remains in their own country and almost at their own doors. There was evidently even there a latent prejudice in English minds against things "made in Greece" or any other foreign country, and this these worthy gentlemen proceeded to arouse, and with considerable success.

There was a rush at once for this new field, and before long it was covered with busy workers. Every corner of it was ransacked, and for a time the completeness of the Gothic finds more than compensated for the greater age of the classic remains in the estimation of the cultured mind.

Fierce, however, was the rivalry between the two schools of ghouls now formed, and bitter and contemptuous the terms applied to each other. The affluent and travelled favoured the Classic, others the Gothic, and the Battle of the Remains was hotly contested.

At last, however, these two great sources of supply began to lose their hold, and a spirit of individuality in the selection of remains sprang up. The up-to-date young ghoul, I mean Architect, was not content to feast on the remains so long exhumed, but would find some place as yet untouched, and there satisfy himself. So one would go to North Italy, another to Belgium, another to some part of France, another to Spain, and from these places return after busy weeks, in triumph, distinguished from the ruck of their fellows by the novelty of their fare, and their contribution to the great Architectural morgue, now assuming such vast proportions.

It will readily be understood that such meddling with the processes of natural decay as I have described could not escape the consequence, and, as a matter-of-fact, did not, for it is well-known that after each such interference there raged over this country what, as I have already said, was called a revival, but which you, I am sure, now see to have been an epidemic. There was, for instance the great Greek Epidemic, followed by the Gothic, and in our own day many of a milder character,

caused by the individual action to which I have referred. The causes having now been firmly established in our minds, let us regard the symptoms and effects of these visitations.

The chief way in which contagion has spread has always been through books. These passing through the country have carried the dread seeds and planted them in many a young mind that otherwise would never have been contaminated. In later days the illustrated papers have been especially disastrous in this effect, making the attack (which in the early part of this century often only happened once to a provincial practitioner in his lifetime, on his subscribing for a copy of a newly published Architectural work) now of weekly occurrence.

There is also in large centres such as this the personal contagion between old and deeply infested artistic constitutions with those younger ones, so susceptible to disease, placed in their charge.

There is also an atmospheric contagion, independent either of books or personal contact, but perhaps more insidious than either; so that the most robust and unlikely constitutions have been infected (such as that of persons engaged in building who have never seen a book which dealt, or been brought into contact with a person who was acquainted, with the sources of infection—i.e., Architectural remains). The disease showing itself in the introduction by them of rude imitations of Architectural ornament in buildings otherwise admirable for their barrenness.

This form of infection can only be accounted for, I think, by the presence of large numbers of buildings in our midst erected by persons evidently suffering from one kind of Architectural Epidemic or another.

The symptoms of infection are not difficult to detect; they will, if conditions are favourable, be plainly apparent. The most favourable conditions for the development of the epidemic in an individual are a client with a desire for show and the means to gratify such a desire. These conditions into which some unfortunate men are more frequently placed than others, lead to a very rapid development indeed. In such a case the inspection of executed works will be sufficient.

There are, however, many cases to which these conditions do not pertain, and in these the detection is somewhat more difficult. The subscribing to any Architectural paper is strongly presumptive of infection, while the possession of several volumes of Academy Architecture is tantamount to certainty. Perhaps the most certain sign is the appendage of A.R.I.B.A. after the name, for it may be considered an impossibility for any one to go over the ground necessary to secure such a possession without falling a victim to the dire scourge. An F.R.I.B.A. is not exposed to the same danger.

If you are anxious to detect the particular kind of epidemic most prevalent in the country at any time, you cannot do better than visit London during the months of May and August, for then (probably owing to the warm weather) it invariably appears in the form of an eruption

or kind of rash on the walls of a small room in Burlington House.

It will now be interesting to notice the effects of the epidemic upon different characters.

With some men it takes the form of an obsession or mania; this man is usually the victim of one of the great kinds—the Classic or Gothic—and its effect on him is to make him intensely eager in the imitation of some particular style of the past, his microscopical investigation and patient ingenuity in reproduction are wonderful, and after years of suffering he will attain to a skill in imitation equal to those Artists whose business it is to produce in less durable material from the remains of great men imitations for popular inspection in different parts of the country, notably at one place in London, although, I suppose, as these persons imitate remains of a higher class, they will consider themselves Artists of a finer order.

Their skill is sometimes so great that they will erect buildings that can scarcely now be distinguished in point of age from their prototypes, and in the course of a century or two will effectually deceive every antiquarian. This is especially apparent in Ecclesiastical Architecture.

This desire to imitate whatever is placed before it is given by Max Nordan in his brilliant and suggestive book, "Degeneration," as a strongly marked characteristic in one class of degenerates. These, you will recollect, according to his idea, are individuals who have dropped out of their rank in the present position of the march of progress, and fallen back to the standard of more primitive man while this particular characteristic indicates a return to a still more remote ancestry.

Max Nordan's ideas are, however, considered rather far-fetched, and when we remember that this characteristic is strongly evinced in many of the works of some of the most eminent members of our profession, it will, I think, be sufficient to disprove such an assertion to our minds.

The effect of an epidemic on other men is more analogous to measles, mumps, or whooping-cough—it is an effect of a decidedly juvenile character. They seem to enter the "bib and tucker" stage, and to view the parade of Architectural styles brought before them, much as a child gazes on his box of bricks when he holds it for the first time, and with

much the same avidity they clutch at the "pretty bits," and build up on paper or in actuality a building with Gothic windows, Renaissance pilasters, pointed arches, and crenulated towers, anything and everything incoherent, incongruous, and yet daring and breathless as the child's giddy column of bricks. Or sometimes he is haunted by some particular form, as in the case of a recent book, "Suggestions for Architectural Designs." The author of that book is plainly suffering from the "Horseshoe Arch" in one of its most malignant forms.

In other men it breeds the desire to unearth the skeleton of long defunct buildings and perpetuate their uselessness by the erection of dwarf walls to mark their plan. It is amusing to note how from the desire to preserve Notable remains, it is only necessary for a thing to be a "Remains" at all to excite a number of amiable idiots to the effort to preserve it, in the face often of its utter uselessness and sometimes utter nuisance. This desire to keep decaying matter in existence and in evidence, is no very pleasant characteristic, and indicative of no very exalted intellectual position.

Such men are as a rule wealthy amateurs, and are further often affected by a desire to undertake the restoration of ancient remains, and as a rule afford pretty instances of "how not to do it."

The unsatisfactory result of putting new wine into old bottles, and new cloth in old garments, is, however, familiar, and need not be insisted on.

One of the most interesting phases of Architectural Epidemics and their effects, is that of the present complication of minor maladies.

In former days, when a man had either the Greek or Gothic form of ailment, he had contracted something that would in all probability remain with him for life, and was generally incurable. But to-day we have a number of trifling disturbances scarcely to be dignified by the names of epidemics, merely nerve complaints mostly effecting the younger of us, and of a very temporary character, not that the victims are ever free from some of these, but none of them are of a permanent nature.

They are generally started by the visit of some particularly susceptible young man to some obscure region of deceased Architecture. He returns with evidences of his infection in the form of sketches which, on publication, carry the germs of disease to all parts of the country.

A number of victims speedily follow, and the epidemic goes merrily on till the arrival of another young traveller from a new source of infection.

Among the first symptoms of these minor complaints is a fine assumption of artistic superiority over the older men, and a scarcely concealed contempt for those still in the grasp of the last epidemic but one. A drawing for the Academy is perhaps the most effective outlet

"BIG AND TUCKER" ARCHITECTURE.

for these cases, and will frequently quite relieve the victim.

Amongst those who suffer in this way there is usually a great desire for up-to-dateness, as I have been assured that in one case known to my authority, in the preparation of some drawings extended over some six weeks, the elevation was entirely compounded out of the six weekly issues of an Architectural paper; and the only regret expressed at the conclusion was, that the portions chosen from the first week's issue were a little out of date, when the design was finally completed.

These slight attacks sometimes manifest themselves in what may be called scissors and paste-pot Architecture. I know a case in which, with the help of a current number of the BUILDERS' JOURNAL and a piece of tracing paper, the plans and elevation of a church were successfully completed in an afternoon, to the satisfaction of the Church Committee.

Some, however, of the minor epidemics arise from the powerful contagion of personal example. For the moment the Architect of some particular building comes into prominence, and immediately a number of hysterical degenerates are infected with his methods. This year it may be Coll-Cutica, the next Belch-era, the year after perhaps both. They are usually affected by eccentricities in the designs that mean just as much as the butterflies in Mr. Whistler's literary productions. They serve as signatures to the designs. We say we know that is Jones's, that is his porch; or it is Smith's, I recognise his pediment; or it is Robinson's, I know his window. It may be a huge canopy, a sort of cross between an arch and a circular pediment, supported on inadequate corbels, or it may be a disposition of window to imitate a columnar building, with the inter-columniations built up, it doesn't matter, the eccentricity is noted and imitated, and we are surfeited with circular canopy porches, on inadequate corbels until some fresher eccentricity procures us sweet surcease of sorrow.

The great desire of this class is to become affected with some hitherto unknown form of Architectural malady, and if they can achieve this they will parade their condition through the Press with the same squalid joy that characterises the goitred mendicants at a Swiss railway station.

As a fellow sufferer, it is most remote from my intention to censure these victims of epidemics. I would as soon blame a man who was attacked by influenza, or complain of the conduct of a typhoid patient.

Leaving these types and speaking generally, it may be said that the effect upon the average Architect is to produce the conditions of a poet whose wife was once told that her husband had too good a memory ever to be original, for whenever he began to write on any subject, all the best things that had been said on that subject came into his mind, and unconsciously into his work. So with the Architect, he feels his best things have all been said, and the most he can do is to repeat them with as much freshness as possible.

Perhaps the worst result, however, of these epidemics is to be found in the enduring traces they leave on the country. Most English towns look as if they had just returned from a fancy dress ball, in which a pious Methodist chapel had appeared in the guise of a heathen temple, the gas office as a wing from a French palace, the bank as an irresponsible Italian villa, while others appear in that inexpensive, though sometimes striking costume, which may be made out of anything that happens to be left over.

I had intended to illustrate my remarks at this point by views of some of the recently executed work in Sunderland and Newcastle, but I have not had the time and opportunity to prepare them. To an observant man the streets are eloquent of the vicissitudes to which they have been exposed. That long street of houses, each with its ridiculous little Parthenaic porch is a melancholy remnant of the Greek infection, that wire-drawn church with its attenuated doors and windows, whispers of a Gothic craze; and to-day every new building has its tale of the anarchy and chaos that is bred by the constant recurrence of plagues, in

which every man does that which is right in his own eyes, from Dan even unto Beersheba.

This is a limitless subject, and to extend it would only weary you. We have seen the cause of these epidemics, the symptoms and effects, and it now only remains to indicate in what direction, if any, we may look for a cure—for a cure is not impossible.

There is, indeed, one remedy with which I shall deal which we might imitate ourselves, but which I am afraid we have not the courage to adopt.

If I have been correct in pointing out our too intimate connection with the past of Architecture as the cause of all our misfortune, it is evident that our only hope in the future lies in severing the fatal connection.

What we have to secure, if not for ourselves, for the more fortunate ones who shall succeed us, is a clean slate; a *tabula rasa* upon which, with unfettered imagination, they may portray with truth and beauty the expressions and desires of their minds and hearts.

Let us remember, then, that it is barrenness of idea we must cultivate, and as complete an ignorance of Architectural form as may be possible for us. Our predecessors have left us with an Augean stable, and upon us devolves the Herculean, if thankless, task of cleansing it.

We must be careful that the pernicious stream of Architectural literature which is contaminating the minds of our students shall be stemmed, and that, while they are instructed in all the theory and practice of construction, they are not hampered by being compelled to imitate dead and gone styles.

The uselessness of learning a dead language is being openly discussed, and perhaps to those interested the uselessness of learning a dead style may in turn become apparent.

Then we may discourage these individuals and societies that grub among the graves of men and things, if we cannot stop their work, we can at least be too busy to listen to them.

Then we can eliminate from the discussions of this and similar societies any reference to past Architectural forms (except, perhaps, in the way of denunciation) and confine our attention to useful and practical subjects, such as the section and size of drain pipes.

Then we can refuse to have any part or lot in the preservation of any ancient monument. Do you remember that weird story of Edgar Allan Poe, in which he tells how a man in the article of death was mesmerised and kept conscious long past the proper period for decay, until at last the mesmeric power being withdrawn, he passed before the eyes of the spectators into a ghastly, viscous fluid? I always feel that this may be the fate of the objects of the interest of the Society for the Preservation of Ancient Monuments.

In this and other ways we may dissociate ourselves from the past with its baneful influences and leave a virgin inheritance to the future.

But I am afraid that "custom doth lie upon us like a weight," "heavy as frost and deep almost as life," too heavy for us to throw off. We shall not be able to do these things, and yet how reasonable they are.

Why should we be overcome by a false reverence for the past?—"We the heirs of all the ages in the foremost ranks of time." Why should we in the manhood of the world seek to clothe ourselves in the garments it threw aside so long ago? When we were children we thought as children, we played as children; but when we became men some other rule of conduct should apply.

In this reverence for the past, for the lower forms of life from which we have emerged, we exhibit the characteristic of a race undeveloped and immature, and withal we are so illogical about it.

The Egyptians, who were perhaps the greatest Society for the Preservation of Ancient Monuments that ever existed, did, at all events, preserve the highest forms of natural objects; but if you were to ask a member of a modern society why, in his passion for ancient monuments, he does not exhume his own or somebody else's great-great-grandfather and utilise him for a drawing-room ornament, he would either shrink from you in disgust or else say he had no room.

But if this member's estimable, if somewhat long defunct, relative's body may not be allowed to occupy the attention or position needed by others, why, in all reason, should his house, or his church, or his jail have the privilege?

Professor Aitchison, in his opening Academy lecture, speaks very acutely of the insistency of Architectural objects, and emphasises the manner in which they will impress themselves upon those who live near them. Then, to say the least of it, it is positively immodest to allow a building, long after it has ceased to perform any useful function, to continue to monopolise the commanding position assigned to it in its first stage of usefulness, and to occupy a situation required for more deserving, if later, comers.

To use a personal illustration, who can assert for a moment that the function and duties of the County Council are not incomparably more important than those of the Dean and Chapter? And yet in Durham the County Buildings—in which this Association was so graciously pleased to interest itself some short while ago—are left in the retirement of the valley, while the Cathedral and Castle brazen it out from the hill.

Who can estimate the demoralising effect upon the inhabitants of Durham in so confusing the relative importance of these institutions? To me, the idea has sometimes occurred that the age of a building should be fixed by the length of its sinking fund.

Then, again, the perpetuation of ancient monuments by this spirit of false reverence serves most effectually to hamper the present and future, by fixing forms.

Now, forms are always changing, and must always change, if they are not to become a strait-jacket for the race, and anything that tends to make them permanent is inflicting an injury upon society. Like the Chinese women, Architecture goes hobbling to-day because of the bandages fastened upon her feet.

Who that has studied any period of real life and activity, and observed the myriad changing forms that passed across it, can doubt the truth of this? An idea materialises into a form to suit some given conditions of life, these alter, then the form must dissolve, break, and leave the idea free to remould itself in other forms. The mould must be plastic, not durable. We sometimes hear of men building for future generations. It is nonsense. They know nothing of the requirements of the future; they can only build for themselves.

There is a delicious irony, viewed in this light, in the efforts of many good folk to-day to preserve that which the builders, if they lived to-day in these altered times, would be the first to destroy.

I can almost fancy there was a touch of prescience about the builders of Peterborough Cathedral when they filled up the interior of their fair round nave pillars with unbounded random rubble and rubbish. They foresaw that the faith for which they built one day would die, and they did not care that their building should survive it—as why should it? Yes, and I fancy they will cheat these busy-bodies who cringe before their work after all.

And here I am reminded of one person who has been robust enough and sane enough to escape the almost universal infection. Not for him the meretricious forms of dead and decadent Art. In his work a simplicity, nay poverty, nay famine, of Art, and then how well he has grasped the principle of the transience of form, and how devotedly he has followed in the train of Nature, who makes her most lovely creatures out of her most fragile materials. True, rude people sneered at, some even forgot themselves so far as to call him "jerry builder," but what recked he? Secure in the knowledge that his buildings had no foundations, and his walls were tied with laths, he put a knocker on the front door, and an open jointed drain in the backyard, and went his way.

And yet it may be that when the "Artist, the Architect, and the Man" comes from the east and from the west to go into the Architectural heaven, the jerry builder may enter before them, for at least the evil that he does

dies with him, and his buildings are often interred before his bones.

From whence, then, cometh our help? Before answering this question I would invite your attention to the two conditions which made a new style possible after the Classic Age, and conversely the absence of which accounts for the rise of no new style after the collapse of the Gothic.

They are, first, the influx of a set of people, barbarian or foreign, to prevailing notions, not understanding and not appreciating them; and second, the use of a new ethical principle, at variance with established ideas, and directly rejecting them.

These were, you remember, in the case of the Classic Age, the overrunning of the Roman Empire by the Teutonic races, and the rise of Christianity.

Professor Aitchison, in a lecture sometime ago, deprecated the idea that a wave of barbarism was necessary to establish a new style, and instanced the Byzantine Architecture, a product of that portion of the Roman Empire least influenced by barbarism.

But this instance really confirms my idea, for however beautiful the development of Byzantine Architecture, it cannot be compared to those styles which grew up in these countries from which the traces of Roman influence were almost obliterated; indeed, to my mind it is little more than a final flare-up of the Classic Age under Greek influence, and inspired by the new idea just then come into the world.

For Professor Aitchison does not point out that if Byzantine Architecture did not benefit by the rude vigour of the barbaric element introduced into the Classic world, it did come greatly under the influence of the new ideas. And this was a very important one, for whereas the tendency of the barbaric element was to ignore through indifference and ignorance the Classic elements around it, the Christian idea intensified this by deliberately rejecting many of them, and so helped most influentially in the oblivion which gradually wrapped them round, and left the ideas of men free to develop in other directions.

At the collapse of the Gothic period there was, however, no break in the continuity of social or ethical life; the old faith had certainly ceased to hold the upper classes, but no new idea claimed its place, and they simply reverted to Paganism. Since then the social order has moved without any interruption either of its creed or its status—it has been content to retain the old ideas, though it may have but little faith in them.

At the time of the French Revolution it did seem as if a new starting point had come; but it was not so—the inertia of the world was too powerful for that movement, brilliant as it was, to overcome, and after its brief turmoil society subsided into its old routine.

There is, however, a movement in the future, near or far, which will supply these two conditions, and it is to this we shall have to look for any improvement in our parlous state.

This movement, known by various names, and sufficiently familiar to us all, will place in prominence a class of people that, in the sense of being foreign or alien to our existing notions, may well be called barbarians, and will introduce an ethic utterly opposed to almost every principle upon which our present society is based.

It is not from any foreign shore that we may expect this influx. As Macaulay, I think it is, tells us, we are manufacturing our own barbarians, who will in time assume over us the dominance assumed by the Teutons over the Latin races.

The truth of this is, I think, becoming more and more apparent to every observant man. The reins of power are slowly but surely passing into their hands, slightly in Imperial, largely, and in some cases almost entirely, the conduct of local affairs is being undertaken by them.

From our point of view, all this means only one thing, and that is the gradual neglect and disregard of all that we have come to think essential to the Architectural character of a building.

Our personal experience of this class will

confirm this view. We have met them on the committees of charities, as the trustees of Methodist chapels, and sometimes in the larger public bodies.

And their characteristic is always a wholesome common-sense and indifferent, if not contemptuous, regard of our little Architectural embellishments.

"What's this thing?" they ask us, to our confusion, as we try to explain that "that" is what gives our design its Greek or Gothic character, and only succeed in convincing them that we are anxious to waste their money. They have no reverence for the past. Well, it has done little for them, and they can scarcely be expected to love it.

Their delight is in modernity, the future they believe is theirs, and relics are not in their line.

By way of illustration I suppose the only genuinely modern feature of Architecture is the plate glass windows, and consequently the most abhorred by all Artistic Architects. But your barbarian delights in it. I remember how a little while ago, I had been erecting some small street houses in Sunderland while suffering under the influence of Mediæval domestic Architecture, aggravated by traces of Coll-Cutica lingering in my system, and had filled all the windows with small panes. A barbarian bought one of the houses, and contemptuously removed those small panes in which I had joyed and filled his windows with one sheet of plate. I admired him while I writhed.

They object to having their windows placed in out-of-the-way corners of the house, though you plead ever so strongly for a symmetrical front, and in a word are utterly regardless of any of your attempts to persuade them that to masquerade in your house is a distinct sign of culture.

I anticipate that as more and more of the control of affairs becomes theirs, building will grow plainer and plainer, all extraneous and superfluous adornments will be rejected, until at last we are as near the clean slate as even I could desire.

And this for two reasons, with which I will close.

First, because in the future the dominant motive will be to save labour as in the past it has been to save money.

To those who have known the hardships of toil, any useless expenditure of it will be hateful and impossible.

And, lastly, because the new ethic opposed to our present ideas will lead them to reject, as far as may be, everything that can remind them of their former conditions and the past. This, at first, will result in bareness, pure and simple; but, as in the case of the Christian rejection of Pagan Art, it will ultimately stimulate to a new birth in Architecture, that will surpass all others that have been by just as much as the happiness and morality of the future shall be beyond all previous social conditions.

THE new Glasgow City Parish Lunatic Asylum, which has just been erected at Gartcosh at a cost of about £200,000, was formally opened last week.

MR. JAMES GREEN, F.S.I., has been appointed arbitrator by the Local Government Board for the purpose of settling the amount of compensation to be paid by the vestry of the parish of St. George's-in-the-East in respect of claims arising from an improvement scheme made under the Housing of the Working Classes Act, 1890.

SEVERAL workmen engaged in building the new mission Church of St. Clement's, Bank Street, Warrington, experienced a narrow escape of injury by the collapse of the gable end of a house in Mersey Mount, which faced the site of the Mission Church. The men had been clearing out the foundations quite close to the house in question, and it is thought that in this and the removal of a stable, &c., the foundations had been disturbed, with the result that, without any warning, the whole gable end, from foundation to roof, two stories high, collapsed, and fell on to the mission site.

## NOTES ON CONCRETE & CEMENTS.\*

BY JOHN JAMES HENDERSON, DUNDEE.

CONCRETE in the dictionary sense means a combination or union of separate particles into one mass, either by spontaneous or artificial cohesion or adhesion. In our more limited sphere the above meaning is applied to a mixture generally consisting of two parts, one called the aggregate, and the other usually but somewhat improperly designated the matrix, so that in both senses natural stone may be called concrete, and concrete may be termed artificial stone.† The uses to which concrete has been applied are so numerous as to challenge computation, while at the same time they compel our interest and attention. Foundations, garden walls, houses, street pavements, bridges, reservoir dams, wells, kitchen sinks, drinking fountains, gasholder tanks, in fact for any and every purpose in which stone or brick is used, there concrete may be used, and when ornamental forms are being made it is more generally spoken of as artificial stone. It may not be out of place to refer to a few examples of its use more in detail. In the matter of houses and garden walls I have no doubt you have examples of mansions, tenements, and cottages. In a cottage which I saw built some years ago, the walls and partitions were run up in the rough, and afterwards plastered over and lined to imitate courses of stone. Out-and-in band corners were formed of cement and sand in shallow moulds of hard wood, allowed to set, and then cemented into place, the cost of the whole being 25 per cent. under that of stone. Although it may seem too radical to the æsthetic mind, which would like everything to be cut or carved and show the marks of the workman's tools, yet

### GOOD CONCRETE PRESENTS SEVERAL ADVANTAGES

even over honest stone and lime. It can be made to resemble any species of stone, either sandstone or limestone, in the finishing. It is absolutely vermin proof, and can be made quite waterproof, and much more impervious to sound than any other species of walling. To jump from a cottage to the dam of the Liverpool Waterworks at Vyrnwy, in Wales, may seem a marvellous transition, but the main principle of the two examples is practically the same, the details being modified according to circumstances. The dimensions of this dam are gigantic, at central section 117ft. in breadth of base, 129ft. in height, 40ft. of which are below the original surface of the valley. The history of its conception and execution would deserve a lecture to itself, and places it alongside the Forth Bridge, the Eddystone Lighthouse, or the Manchester Canal in national utility and importance. What more immediately concerns us is a comparison of the detail of its construction with that of a house wall. In ordinary housework the concrete is made up with larger aggregate similar to broken road metal or gravel, but in the best class of work the coarser aggregate is omitted, leaving the concrete more resembling mortar, and in that mortar is embedded rough blocks of stone, making the resulting wall not unlike random rubble, but possessing infinitely more strength; in fact, such work now goes by the name of rubble concrete. Of course, the form and strength of these filling-in pieces will vary according to the locality of the work. In this Welsh waterworks dam the large stones vary in size from eight tons downward through all sizes to that of 2in. road metal. For the centre of the work these are dressed flat only on the bed, and any unshapely projections are hammered off. A 2in. bed of concrete mortar is spread over the prepared surface and the stone lowered upon it and hammered until

\* A paper read before the Edinburgh Architectural Society.

† I am not here referring to Ransome's artificial stone, which is obtained by dissolving fluids, and subjecting the resultant paste to chemical action, nor to the new process known as "Owen Stone," a combination of hydraulic lime and sand under a pressure of 80lb. to the square inch, and at a temperature of 250 degrees. From specimens and reports this stone appears to have a great future before it.

the concrete mortar rises up around it. The interstices are filled up with stones according to the size of the space, even the 2in. macadam not being mixed with the mortar, but like every stone throughout the whole monolithic mass hammered into place. By these means voids or air spaces are absolutely impossible, while in a house-wall constructed with frames the hammering cannot be so persistent, and the voids are not so prejudicial, because of the finishing coat of cement plaster or cement painting usually applied. On the face of the dam the stones are squared top, bottom, and sides, and the joints caulked after the manner of caulking the timbers of a wooden ship, but with cement very slightly moistened. In one of his lectures Professor Unwin quotes the remark of a visitor of large experience in masonry—that the Liverpool people have in this dam a piece of masonry not surpassed for solidity by any masonry in the world. The two sections show a portion of a pipe embedded in concrete, laid by the Romans for supply of water to their camp at Lindum or Lincoln about the beginning of the Christian era. The core is a clay pipe unglazed, and the surrounding concrete is of lime and burnt clay or other small-sized hard angular porous aggregate. This lime concrete, though excellent of its kind, and watertight under moderate pressure, does not possess the strength of cement concrete. I should like you to compare with the Roman work a portion of a pipe from the Imperial Stone Company of London made of Portland cement and crushed Thames gravel. This bringing together side by side of the ancient and modern shows us that the Romans knew how to take advantage of the materials around them, while it also marks the

#### GREAT ADVANCE IN THE ART

since their day. The Roman pipe, you will find, has been coated with concrete *in situ*, subjected only to so much pressure as by a maul in the hands of a workman; while this London pipe has been made under mechanical compression of several tons weight. This may be taken as one of the proofs that the pessimists are wrong when they say that work was better done in the olden times than now. The purchaser can still get a good article if he is willing to pay the requisite price. Possibly there was not the keen competition and cutting down of prices among the Romans which obtains in our day. This pipe is said by the makers to be suitable for forming wells. Not long ago I saw a well formed of rough concrete where the excavation had been taken out in hexagonal shape, and the well formed circular inside, the least thickness being about 8in. If a pipe had been used of larger size, say 30in. diameter and 2in. thickness of metal, it would have acted as its own timbering, and have sunk to its position in the gravelly soil while the material was being dug out inside. At the Dundee Royal Infirmary there is a very fine example of the application of concrete to steps or staircases, with the addition of colour, made of granolithic, by Messrs. Stewart and Co. It is an outside stair to the front entrance, and the span is 9ft. 9in. between iron flying stringer beams. In a biscuit factory recently erected in Dundee the floors are of concrete, formed of crushed gas retorts, to obtain a substance absolutely fireproof. At Messrs. Coates' thread mills in Paisley all its six floors are of concrete, the five upper floors being supported on iron columns, rolled iron beams, and cross shallow iron rails. One mill measures 400ft. by 150ft., and the other 200ft. by 96ft., or a total area of between eight and nine thousand square yards, five-sixths of which are hung in air. About eight years ago a tenement of houses built in Dundee was formed with a flat roof of concrete, with the washing-house upon it, and an enclosed ventilated space for drying purposes. Provision was made in the specification that asphalt could be laid above the concrete in case the concrete did not sufficiently resist the atmospheric influences, and the usual expansion and contraction of so large a surface. When I examined it the other day I found that no asphalt had been required, but that some leakage from the washing tubs had repeatedly come through

and spoiled the ceiling of the upper houses, showing that the concrete had answered its original purpose, but that the other artificers had been careless in their manner of carrying out the subsidiary works of pipe-jointing and draining. I have a sketch showing one of the earliest methods of embedding the iron within the concrete, either in floor or roof, so as to shield the iron from the possible action of fire, and the latest application of this method is to construct a bridge or a wall of a series of iron gratings, and bed the concrete all round these. In sea-walls, piers, or breakwaters, the use of concrete in one form or another has been almost universal, and its method, proportion and size as various as the examples themselves. At Dublin you have cubical blocks of 100 tons weight lifted by giant cranes and gently dropped into position. At Wick even larger masses have been formed in position, but on occasion of fierce storms masses of 1300 tons weight have been dislodged from their position by the action of the waves. At other places, such as Aberdeen, it is deposited in bags so as to adapt its shape to that of the rocky bottom. Then in some of the Indian breakwaters it is deposited in blocks of fifty or sixty tons weight, set on edge, so as to be pressed down into the soil or gravel and gradually attain to a firm foundation. Again, in other cases where the bottom is too yielding a mound of loose stones is deposited along the line of pier, and the concrete blocks or bags lowered thereon. The use of concrete for gasholder tank walls or walls of wet docks illustrates the progress made. Formerly there would be a brick or stone facing, with the concrete only used for subordinate positions, such as foundation courses, pockets, or backing. In the next stage the whole wall is formed of concrete, with large-sized aggregate, as at the South London Gasworks; and a further step will be to make the wall of thin slabs with small-sized aggregate, and supported by counterforts, or, as a London gas engineer calls it, the cellular system of walling, which is just Mr. Cunningham's cellular foundation turned on edge. On the London Metropolitan Underground Railway you may see portions of walling constructed with the bare concrete, but I would like you to notice there the unfinished appearance of the work, because the aggregate has not been small enough, and the face appears porous or honeycombed. A coat of cement plaster on the surface would not adhere for any length of time because of climatic and water conditions, and a washing of fluid cement would scarcely suffice to fill up all the pores; in fact, there are very few positions where the coat of plaster will adhere; as you can easily understand, the time that elapses between the erection of the wall and the application of the plaster has formed a skin to a greater or lesser extent, which prevents the adhesion. It is far better to use such aggregate as can be run or pounded close together and form the smooth surface at the first time of asking; which, to be sure, implies the use of smooth boarding or lagging flush-jointed, and any small pores showing on the surface can be readily filled up by washing or painting with fluid cement. Just as you have seen vegetation of a certain kind growing on natural stone by the roots getting into the pores, so similar vegetation will get into the pores of concrete, hence the necessity for attempting to fill up these pores. In building garden walls, it is advisable to form pillars or some other means at short intervals by which to allow for expansion and contraction, because it is not very slightly to see nicely plastered garden walls disfigured by hair-cracks at irregular intervals, and these can only be avoided by doing the work in sections, as is done by the Granolithic Company in its street pavement work. The expansion has been calculated by the late Mr. Cunningham through a series of experiments at 1 in 19·20, or one-eighth of an inch in 20 feet. If any of you happen to visit Blairgowrie; by looking out of the railway carriage window on the west side, just after passing Rosemount station, you will see a most unsightly example of cheap unfinished work in the shape of garden walls and gate pillars, crumbling rough edges, holes, and general disintegration. I recently learned that

concrete is used for ballasting fishing boats. In a description of the loss of a Cellardyke boat, there occur these words: "Being filled with fixed cement for ballast, there would be no chance of the boat floating." On making enquiry, I am told that one boat so fitted was not a success, because the solid run-in floor destroyed the boat's flexibility. In other cases, the concrete is only run in under the cabin, while in the forward part, boulders are used, with boards above the boulders, and fixings or divisions to keep the boards in place. These boulders sometimes shift if the boat is lying much over to one side, and so prevent the boat righting itself, while they are generally removed when the boats are drawn ashore for repairs or cleaning. It seems to me there is here a field for a practical philanthropist to induce the fishermen to use blocks of concrete—loosely fitted to the shape of the boat, loose from each other, and also loose from the boat. This would preserve the flexibility of the boat, and at the same time give more room and a flatter floor inside, while they could easily be removed and replaced when occasion required or necessity demanded.

(To be continued.)

#### Business Premises, Mosley Street, Newcastle-on-Tyne.

OUR Illustration represents a small block of business premises, comprising a ground floor covering the full area of the site, and is partially top-lighted; three upper floors, a basement, and caretaker's apartments. The elevation is built in red Ruabon bricks and red stone. The Architects are Messrs. Armstrong and Knowles, of the same town.

THE temporary dispersal of the collections at South Kensington Museum will soon be put in hand. We believe that it is in contemplation to send the pictures comprising the Chantry bequest to the Tate Gallery. The Peyre collection of wood-work and carving will also be dispersed.

THE Central London Railway Company has officially notified its withdrawal of the Bill deposited by it for the present session for power to acquire certain lands on the north side of Oxford Street, and to alter the position of its station under Oxford-street, near Marylebone Lane.

THE Barton House Estate, South Warwickshire, comprising an original Jacobean mansion, built by Inigo Jones in the year 1615 for Sir James Overbury, with its estate of about 750 acres, has just been sold by Messrs. John D. Wood and Company, of Mount Street, for £27,200, including the valuable timber.

An alarming incident occurred at the Royal Hotel, Ashby-de-la-Zouch, where a fall of stone coping and lead from the roof took place. Several tons of rubbish lay scattered along the front of the hotel. The porch leading to the entrance was greatly damaged, and a gas-pipe severed. The hotel is an old building, and much used by the visitors in connection with the famous Ashby-de-la-Zouch baths.

A NEW bridge across the Spey at Boat of Inch, near Kincaig Station, was formally opened last week by Mr. John Macpherson Grant, Ballindalloch and Invershie. The structure replaces another erected nearly 30 years ago. It cost about £1000, and the contractor was Mr. Roderick Fraser, Inverness. The new bridge is within a few yards of the spot where the Queen and Prince Consort were ferried over in September, 1860, on their tour from Balmoral to Grantown.

THE Municipal Commission on the Paris Metropolitan Railway has considered the objections raised by the Compagnie Générale de Traction against the modifications made in the provisional contract and specifications. The Concessionaire Company asks that it be compelled to establish stations in buildings in line with the houses only in exceptional cases. It declines responsibility for the good condition of the works of infra-structure, and objects to the clause making it incumbent on it to take up a portion of the loan raised by the city for carrying out those works.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
June 23rd, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

If the Architecture of London is disappearing behind unlovely scaffolding, one comfort is that the County Council is diligently providing for the safety of those who will avail themselves of these points of vantage on Jubilee Day. Thanks to the consolidated system of local government now prevailing in the metropolis, and the ample powers vested in the Council, the most stringent regulations can be enforced against those speculators who are providing stands for the public at so much a head. The Architect's department is looking carefully to the solidity of the temporary platforms, a very necessary precaution; and not only is the strength of the supports minutely tested, but the structural plans are required to furnish adequate means of exit in the event of a panic arising.

FROM statistics, somewhat roughly taken it is true, we gather that the erection of stands on Constitution Hill consist of some 12,130 lineal feet. In Grosvenor Place and immediate adjoining spaces some 8,960ft. cubic of timber and over three tons of ironwork have been brought into use. From Hyde Park Corner to St. James's Street accommodation has been arranged for about 3500 occupants. St. James's Street in itself has provided temporary erections for 2500, and from thence to Regent Street will extend a chain of seats 8500ft. in length, most of which will be in double or treble tiers. It is said Charing Cross Station stand will have absorbed in its construction 630 tons of timber and four and a half tons of iron in bolts, nails, nuts, and shoulder-pieces. From the Strand to Cheapside it is computed that 198,525ft. of seating will be erected.

THE last stages of the decoration of the choir of St. Paul's Cathedral have now been reached. All the mosaics are finished, and the gilding of the stone bosses and the decoration of the mouldings of the panels of the choir arches are in hand. This final work is comparatively a small matter, and is now practically finished. Meanwhile, the decoration of the four quarter domes at the intersection of the transepts is being proceeded with. Mr. Richmond has completed his design for the first one, a representation of the Crucifixion; and has selected as subjects for the others the Entombment, the Resurrection, and the Sending Forth of the Apostles.

A STATUE of Mrs. Siddons, which has at last been erected near the grave of the great actress from a design of M. Chavilland and heartily approved of by the late Lord Leighton, was unveiled on Monday, the 14th inst., by Sir Henry Irving. The statue represents Mrs. Siddons as "Tragedy," sitting in a Greek chair similar to the famous marble ones in the "cavea" of the theatre of Dionysus on the slopes of the Acropolis of Athens. The marble selected, one of the hardest and most durable known, is from the Carrara quarries. The statue, which is of one solid block, and is placed on a boldly moulded pedestal of Portland

stone, on a raised platform of the same material, was modelled by M. L. Chavilland.

A STATEMENT with reference to the restoration of Rochester Cathedral has just been issued by Dean Hole. It appears that the total expenditure upon the west front and other works connected therewith was £7358. Besides this, between £600 and £700 has been expended upon the crypt. The old Norman work has been carefully preserved, and the southernmost aisle has been partitioned off into a series of vestries. Of the amount last claimed £500 was contributed by the Dean, as the result of his lecturing tour in the United States. It is now proposed to launch a larger scheme of restoration. It is desired to restore two of the roofs which were spoiled by being lowered in times gone by, and to build a new tower and spire in place of "the present deformity," as the Dean terms the existing tower. The estimated cost of this project is £20,000.

It would be extremely difficult to recall any exhibition of pictures where the whole sentiment of rest and tranquil beauty has been more fully conveyed than in those which are now on view at the Fine Art Gallery. They are the work of Onorato Carlandi, and are in water-colour. Their subject is Rome and the Tiber valley. To many visitors they will reveal a new Italy, seen through the medium of a somewhat melancholy temperament, which has been profoundly impressed by the dead glory of a long-forgotten day. The drawings are nearly all low-toned and of wonderful softness, but the work is direct and simple, untroubled by any working up. A very favourite subject with the Artist is the river, passing along between sandy banks, its colour muddy yellow, but wonderful in its liquidity. The landscape solemn in its solitude and stillness, the few trees leafless, their bare branches making a deeper note of colour.

THE Marquis of Dufferin and Ava laid the inaugural stone of the harbour in course of construction at Hastings last week. The work is promoted by local men, the contract price being £150,000. Some alterations, however, have been necessitated by the discovery of a mud bank, which will involve a further outlay. The acreage of the harbour in the deep part is to be twenty-seven acres. The two arms will be of the total length of 3000ft. The harbour at spring tides will have a draught of 13ft. of water, and the breakwaters will be 10ft. above high tide, the foundation structure being 15ft., and the superstructure 28ft. 6in. It is hoped to complete the western arm this year and to finish the eastern arm next year.

A CORNER of old Paris familiar to every tourist is shortly to be pulled down, but as the threatened buildings are altogether hideous the news will be received without regret. Every visitor to Notre-Dame has been disagreeably struck by the barrack-like erection on the southern side of the arm of the Seine. It is this eyesore, which is an annexe of the old Hôtel-Dieu Hospital, that is to be razed to the ground. With it will vanish the ugly wooden passage crossing the Rue de la Bucherie, which was a continuation of the Pont Saint-Charles, known as the "Bridge of the Dead," because it was traversed by the bodies on their way to the Saint-Julien-le-Pauvre Mortuary. On the space thus obtained the municipality intend erecting schools.

It has now been decided, with the concurrence of the Dean and Chapter, to erect in St. Paul's, where Lord Leighton is buried, a monument in the form of an altar tomb, supported by appropriate emblematic figures. The commission has been intrusted to Mr. Thomas Brock, R.A., who has furnished a design most satisfactory to the sub-committee. At present the total amount subscribed is about £2400.

THE Leeds Art Gallery Sub-committee has decided to recommend the purchase of three works which have been shown in the spring

Exhibition. They consist of two water-colours, "The Old Barn Door" and "Sunlight on the Hills," by G. C. Haité, and a large oil painting by Thomas Millie Dow, entitled "A Village in the Appenines." The Free Public Library Committee confirmed the recommendation, and resolved to purchase, subject to the approval of the City Council, oil paintings by Alfred East, Madame Ronner, R. Vicat Cole, James Clark, Owen Bower, W. L. Llewellyn, and R. C. Robertson, for which offers were made last month. It was, at the same time, decided to buy a metal plaque by G. Bayes, a bronze statuette by Beguina, and a bronze door-knocker by Alfred Stevens.

SEVERAL interesting items were included in the second day's sale, by Messrs. Sotheby, Wilkinson, and Hodge, of works illustrated by George Cruikshank, the property of Mr. W. H. Bruton, of Gloucester. "The Meteor; or, Monthly Censor, a Critical, Satirical, and Literary Magazine," with etched initials by Cruikshank, in 2 vols., fetched £73; "Wit's Magazine and Attic Miscellany," complete with humorous coloured plates, sold for £56; Illustrations to "Punch" and "Judy," the complete series, with plates, fetched £29; W. H. Maxwell's "History of the Irish Rebellion in 1798," in which the Artist has written "First proof, George Cruikshank," £45 10s.; "The Ingoldsby Legends," with proof illustrations, £29; and "The Humorist," a collection of entertaining tales and anecdotes, with coloured plates, first edition, £60.

At the forty-third general meeting of the shareholders of the Suez Canal Company held in Paris, reference was made to a scheme for a commemorative monument of the services rendered to the whole world by Ferdinand de Lesseps. "At Port Said," said Prince d'Arenberg, "there is at the very entrance to the canal a site where the statue of Ferdinand de Lesseps would stand out against the perennial blue sky of Egypt, and no one in days to come could enter the Suez Canal without having before his eyes the image of the man who, by his genius and indomitable energy altered the relations between peoples, and completed the work of nature, by abridging distances to the great benefit of humanity." The cost, amounting approximately to 250,000fr., would be spread over five years. The proposal was adopted unanimously. M. Fremiet, the sculptor who has been commissioned to execute the statue, says the monument will be four times life size. M. de Lesseps will be represented standing with the plans of the canal in one hand, and the other hand pointing towards the entrance. Upon the granite pedestal will be medallions representing in bas-relief the portraits of the three Khedives who encouraged the construction of the canal. It is expected that the statue will be finished and placed in position within two years from now.

At the seventh annual conference of the Council of Church Bell Ringers held at the Church House, Westminster, it was resolved that, having regard to the lamentable condition into which a large proportion of English bells, many of them of historic and priceless value, have been allowed to fall, a return should be prepared of the present state of all the more important peals, with the view of drawing public attention to the matter.

In an out-of-the-way spot on the north-west coast of Spain is a novel memorial which should be of interest to all British as well as Spanish subjects, for it is here that a tablet is erected by the British Admiralty to the memory of those who lost their lives on board the *Serpent* when she was wrecked in the neighbourhood. The tablets are secured to a huge mass of rock, on which the cross stone is supported. The left lower tablet is that of the *Serpent*; it is made of marble, and is let solidly into a recess in the rock. The right lower one is in memory of a Spaniard—D. José Vlanova Y. Vilar; this tablet is of marble, and is let solidly into the rock. Of the upper three, the one to the left is in

memory of the Reina Regente, and the centre one appears to be the official dedication.

THE Old Bell Tavern and Hotel in Holborn, one of the last, if not the very last, of the famous ancient London hostelries that still remain to us in anything like their original shape and form, and which, as previously stated, is shortly to be sold by auction and pulled down, stands in one of the most picturesque parts of Holborn. There are the heavy wooden gates that have swung on their hinges ever since the Old Bell was built on the site of the inn that it is said was there 300 years ago. There, to the left, as you pass them, is the queer little old kitchen of the establishment, and next to it the cosy little private parlour. Then there are the numerous little bedrooms for travellers opening out from the wooden galleries; and on the right is a long row of ghostly-looking little bells that have been rung many and many a time by travellers that have long ceased to travel. Below the bells is the cosy old coffee room, and close at hand the little hotel bar for those who still haunt the old place. All is just as it used to be in the good old days of comfortable inns. As we face towards the back of the house we catch sight of a tiny figure of Napoleon standing in a small niche above the gateway. The present occupier of the premises thinks the brick portion of them was built about 1720. Stowe's survey of 1633, brought up to date of 1720 by Strype, mentions the Bell as one of "several considerable inns very much frequented by wagons, coaches, and horses, from several parts of England, chiefly westwards and northwards." Therefore it is reasonable to allow, as is claimed by those interested in the old place, that in the days when the players were not very well provided with theatres, entertainments were frequently given in the old inn yard.

For some months past the front of the Sun Offices, at the corner of Threadneedle Street and Bartholomew Lane, has been concealed by a huge mass of scaffolding, which has been erected for the purpose of allowing extensive alterations to be made. The original offices of the Company were next to the Old Crown Tavern, in Threadneedle Street, and, together with the tavern, were cleared away for the additions to the Bank of England in 1770. When the Church of St. Bartholomew-by-the-Exchange was removed in 1841, the site at the corner of Bartholomew Lane and Threadneedle Street was secured by the Company for new offices, and Professor C. R. Cockerell, R.A., the Architect, prepared the design for the offices which were erected on that spot. There are several other examples of Cockerell's work in the City, notably the offices of the London and Westminster Bank in Lothbury, which were erected in 1837. The Sun Offices were built of Portland stone, and consisted of a large block, with a ground floor and three upper stories. The top floor was very shallow, with small, low windows, and the roof was supported by a row of stone columns rising from the level of the second floor. In 1893 the old premises situated next to the Sun office were secured by the Company for the extension of its premises, and, with the idea of adding a new floor to the existing offices, plans were prepared for the erection of the new building, which was designed by Mr. F. W. Porter, of Russell Square, to correspond with the proposed alterations in the frontage of the old building. The new offices consist of a ground floor and four upper stories, and, in order to make the whole correspond, the top story of the old building has been raised to range with the new portion, and the extra floor has been continued all round the building. The columns, which originally sprang from the level of the second floor, have been raised a story, and are now placed on pedestals so as to heighten the upper story. This alteration, of course, amounts practically to the destruction of Cockerell's design, and the result, which will be revealed on the removal of the scaffolding, is awaited with considerable interest. The new building is entirely devoted to the needs of the Life staff, whilst it is hoped that the extra story will afford sufficient

accommodation for the Fire staffs. The work of alteration has been one of considerable difficulty, and has necessarily proceeded slowly, as the business of the Company has been transacted in the offices throughout the alterations. It is, however, hoped that before the end of the year the alterations will be completed.

THE loan collection of works of Art which has occupied the walls of the Bradford Corporation Art Gallery in Darley Street for the past few months, closed a few days ago and opened again this week with a collection of works by J. M. W. Turner, R.A. As is well known, Turner left at his death the whole of the artistic contents of his house to the nation, and it is a striking testimony to the industry he displayed that there were among those works no fewer than 19,000 drawings—some being mere pencil notes, but many elaborate paintings in colour. Mr. Ruskin spent a considerable time in going through the vast mass for the National Gallery, and besides the more important works which are hung in the cellars in Trafalgar Square, he selected works to form travelling collections representing Turner's different periods of work. Other collections have since been formed, and five are now in course of circulation through the country, one of them being recently on view in Leeds. The collection to be shown in Bradford is the sixth of the series, and has never yet been exhibited, the fifty-three works composing it having only recently been selected from the great mass of drawings still lying in the National Gallery's strong rooms. In addition to this valuable exhibit, Mr. Merton Russell Cotes, F.R.G.S., of Bournemouth, has lent for exhibition a small collection of works by modern Artists. Many of these are by very well-known Artists, one of the most delightful being a sea piece by the late Henry Moore, A.R.A.; and Mr. Marcus Stone, R.A., Mr. E. Long, R.A., Mr. Erskine Nicol, R.A., Mr. J. McWhirter, A.R.A., Mr. Colin Hunter, A.R.A., the late G. B. O'Neill, Mr. C. W. Wyllie, Mr. W. Denby Sadler, and others are represented.

OCTOBER will probably witness, in the laying of the foundation stone, the first public ceremony connected with the removal of Christ's Hospital from its home in the City to the country estate that has been purchased at Horsham. That the decision of the almoners was the reverse of a wise one we are fully convinced, but now that the step has been irretrievably taken it is useless to further protest, and all that remains to be done is to strain every nerve to minimize the disadvantages and utilise to the full the advantages associated with the change. The Council has a hard battle before it, and it will need the united assistance of all who take an interest in the hospital, and we earnestly hope that its success in the future will rival its glorious traditions. Only by a united effort indeed will it be possible to avert the fate that so many fear is certain to follow in the wake of the sudden breaking away from old associations.

THE rival Paris Salons are drawing to a close, and in a few days they will be numbered with the past. Neither of them, perhaps, contained anything so remarkable as the four pastels which Rosa Bonheur exhibits in the gallery of Georges Petit, and to which all lovers of Art should pay a visit. The Artist is now in her seventy-fifth year of age. Her reputation dates from a long time back, and those who have not seen her works would be able to form some opinion of her talent by going to the Luxembourg, where they would find her "Labourage Nivernais," which was exhibited in the Salon of 1849, and bought by the State for 20,000 francs. The first painting of Rosa Bonheur appeared in 1840, and represented two rabbits nibbling some carrots and turnips. She continued to contribute to the Salon up to 1865, when, on the request of the Empress Eugénie, she was decorated with the Red Ribbon of the Legion of Honour. The pastels she now exhibits were completed in a year. One of them represents a number of stags wandering in a forest at moonlight; another shows us a drove of bisons in the snow; while a third portrays a flock of sheep

sleeping under the trees. They are all admirable for their wonderful fidelity to Nature.

DR. HUNTER-SELKIRK, of Braidwood, has presented the whole of his unique antiquarian and geological collection to Kilmarnock Museum. Dr. Hunter-Selkirk's museum, which is henceforth to be incorporated with that of Kilmarnock, is well-known as one of the most valuable and extensive in the possession of any private individual in the kingdom. Among its treasures are 30,000 old coins, mostly British, but including many rare foreign specimens. Old swords and guns, relics of Drumclog, Bothwell Bridge, and other Covenanting battles, are numerous, as are also articles illustrative of civilisation in the past, and curiosities in the shape of old watches, watch-keys, snuff boxes, &c. One of the finest sections of the collection is the old pottery, which includes many examples of rare Wedgwood ware.

THE Archaeological section of the Birmingham and Midland Institute recently visited The Nash, the seat of Sir Richard Temple, Bart. The Nash presents the appearance of a delightful Elizabethan manor house, and the greater part of it would be correctly so described. But the original mansion must be of much earlier date, as may be seen by the enormous thickness of the walls in certain places—capacious closets being actually ensconced in them. Several of the rooms are of great interest, being practically unchanged since the days of Shakespeare and of good Queen Bess. In this respect the dining-room is conspicuous. The old Elizabethan oak panelling, which, after being painted most of the colours of the rainbow, has been carefully restored to its original simplicity by the present owner, is yet more recent than the singularly fine ceiling in elaborate plaster work; and the hooks for supporting the tapestry, which the wainscot replaced, were discovered in the course of recent renovations. The overmantel is an elaborate and beautiful religious subject, apparently Italian. The hall is also a very fine room, and there are peculiarities in the domed ceilings of two apartments and in other internal arrangements which are deserving of careful study. The bedrooms are quaint, unexpected in shape, prodigal of unlooked-for corners, and suggestive of perfect comfort. The walls are covered with the paintings of three generations, among which the vivid depictions of Indian scenery by Sir Richard Temple himself are conspicuous. Rare prints, choice furniture of all ages, from Tudor times to the Sheraton period, decorative paintings on marble, attributed to Angelica Kauffman, a well-arranged and most attractive library, medals, miniatures, old china, priceless autographs, collections of Indian arms, fine overmantles, trophies of the chase, and family portraits, are everywhere in bewildering profusion.

A PUBLIC meeting, presided over by Lord Russell of Killowen, was recently held in the Hackney Town Hall to consider the steps to be taken for the establishment of a Technical Institute for the locality. The meeting was convened by the Hackney Vestry and the Technical Education Board of the London County Council. Lord Russell said the object of the meeting was to secure the establishment in Hackney of a fully-equipped technical institute, with allied trade classes, in order that the inhabitants of this working-class community might have the benefit of the most modern applications of Art and Science to the handicrafts of every-day life. The last attempt, made in 1891-2, to establish such an Institute proved unsuccessful, though funds in the hands of the Commissioners of the City Parochial Charities were available. It was proposed that the existing Sandringham Road School of Art and the North-East London Institute, which did not meet the requirements of the district, should be amalgamated, so as to form part of the proposed polytechnic. £5000 had already been secured from the Sir John Cass Foundation Funds. If the local support was freely given in this matter, assistance would be received from the Technical Education Board of the London County Council

—a body which had the administration of a large sum of money every year for the furtherance of technical education. These polytechnic institutions were rapidly increasing in numbers in the country, and, as far as the metropolis was concerned, when Woolwich, for instance, was able to obtain £5000 a year, Hackney ought, by bestirring itself, to secure increased educational advantages. He was willing to contribute £100 towards the sum to be raised by subscriptions on condition that £1000 was subscribed by Hackney.

THE Emperor William has caused a small barrack to be erected for him in the garden of the garrison hospital in Heligoland. The barrack is about 30 metres long by 15 wide, and is in the shape of an octagonal. On one of its sides is a small closed verandah. The interior of the barrack is divided into two parts by a passage. On one side are the Emperor's study and bedchamber, on the other side a bathroom and servants' room. The little edifice is painted grey-green outside, and inside white with brown and gilt ornamentation. In the latter the Prussian eagle plays a principal part.

At the annual Congress of Archaeological Societies, which will be held at Burlington House in the course of the present month, progress will be made with the scheme discussed last year for compiling a general catalogue of historical portraits throughout the country.\* Although it obviously involves some difficult and delicate questions, the idea is so excellent that one must wish it all success. Would it not be possible to utilise such a catalogue—possessing, as it will, an authoritative character—for deciding some of the points that arise under the Finance Act? There is, perhaps, no more eloquent testimony to the cruel strain the new death duties are inflicting on the old landed houses, already crippled by agricultural depression, than the way in which some of them are now being forced to sell their family portraits.

"THE Bishop of Chester has called attention in your columns to a very important question of Church planning," writes Mr. W. D. Caröe to the Times, "one which has been the subject of much anxious consideration upon the part of all thoughtful workers in Ecclesiastical Architecture. The document from which the Bishop quotes is a very familiar one, but the cloudiness of its conclusions and the absolute impossibility of their application in many instances render it comparatively useless except as a basis for further discussion. Neither does this document nor the Bishop's letter touch upon one aspect of the question to which, in these days, a great many of the surrounding difficulties may be traced; I allude to the frequent "monstrosity" of the modern organ, using the term in its fullest sense. It is more often than not that the organist and organ-builder can think of nothing but the magnifying each of his office, and the result is a prodigious erection quite incommensurate with the musical needs of the Church, out of harmony and scale with its proportions. Too frequently it is planted down to hide from view, if not actually to destroy, some object of beauty or antiquarian interest—a burden not only upon the edifice which it defaces, but upon the parishioners who have to pay for it. The sufficiency of the 8ft. harmonic pipe cannot be sufficiently urged instead of the 16ft. open; such a disastrous introduction into most Churches of moderate dimensions not originally constructed for it. If the York Committee will give its attention to the size of organs as well as to their disposition, and circulate some authoritative statement tending to curb the exaggerated notions of organists, they will be helping 'the adoption of more suitable arrangements for musical purposes' not a little, and secure the avoidance of much needless injury to many an ancient edifice. Even if commensurate in size to its surroundings, the organ is one of the most important, as it must be one of the most prominent, of Church fittings. Its construction is such that it can adapt itself readily to the highest and best of

artistic treatments—that of suitability and fitness not only to its environment, but to a proper expression of itself and its uses. Yet in most cases it succeeds in being the most ill-designed and generally the most vulgar erection imaginable. One point may be mentioned in reference to the much-abused organ-chamber. If the organ is too powerful for the Church, or too raw and blatant in tone, the best thing that can be done with it is to put it away in a properly-designed chamber, which, after all, is only after the manner of a swell-box in another form. The construction of the organ-chamber or 'place,' if the term be preferred, is thus also deserving of the York Committee's attention."

WE have already commented on the fortunes being made just now by the builders engaged on the erection of stands. Equally fortunate are the firework manufacturers, who are so inundated with orders that they scarcely know which way to turn, and are compelled to work day and night to cope with the demands made upon them. Prices have gone up to a fabulous extent, and, as the labour involved is small, each increase practically means so much additional profit. Not quite so fortunate, though very nearly so, are the firms that make a special feature of decorations and illuminations. In their case, however, the labour bill is a very costly item. Further, the prices are being "cut," whereas, as regards fireworks, all the trade rests with half-a-dozen firms, and the prices asked are readily accepted.

MR. R. BUTSON, surveyor, of Chancery Lane, forwards a letter in reference to the discussion last week at the meeting of the City of London Tradesmen's Club on the question of the erection of stands inside private houses and shops. Mr. Butson thinks that the protest entered at that meeting against interference with the inside of houses is quite out of the question in a matter so closely affecting the lives and limbs of the general public. He points out that the persons who have let their houses for the erection of stands have, by that very act, turned their rooms into places of public entertainment, and thus confiscated the right of self-control and privacy. If, argues Mr. Butson, the London County Council is right in enforcing its laws for the protection of the people outside the City, the attitude which the Commissioners of Sewers have assumed inside the City, by shutting their eyes to probable danger, is altogether wrong, and, should an accident occur which by ordinary prudent foresight might have been avoided, will at least shatter that confidence which the public should have in the rulers of this grand old City, and spoil the Jubilee celebration.

MESSRS. CHRISTIE, MANSON, AND WOODS sold on Saturday week the collection of pictures of the late Sir W. W. Burrell, and pictures by old masters, the property of Lord Waterpark. The Burrell pictures, eighty-four in number, realised £2200, and included two examples of George Romney, first a sketch in oils of Lady Hamilton, seated, resting her head on her right hand, in white dress, 24in. by 20in., 850 guineas. This portrait, the face of which has obviously been tampered with by either a restorer or cleaner, bears a striking resemblance to the beautiful sketch in the James Price sale of 1895, which realised 2030 guineas. The second Romney was an exceedingly good portrait, well preserved, of John Dunlop, in brown coat and wig, painted in 1778, 30in. by 25in., 125 guineas. The other pictures in this collection included works by J. Van Goyen, Sir T. Lawrence, A. Van der Neer, and J. Ward, R.A. Lord Waterpark's pictures included two portraits of William, fourth Duke of Devonshire, both by Sir Joshua Reynolds, in one of which the Duke is represented with robes and Order of the Garter, holding wand of office in his right hand, 50in. by 40in., 300 guineas. In the second portrait he is in a grey coat, with blue and gold facings, powdered hair, left hand resting on his sword, 50in. by 40in., 240 guineas. Other properties included: Zuccheri, portrait of Queen Elizabeth, in green dress, lace ruff and veil, and jewelled head-

dress, holding a fan in her left hand, 36in. by 27in., 82 guineas; A. Cuyt, "La Pêche au Saumon," a youth showing a salmon to a gentleman on horseback, signed, 42in. by 31in., 145 guineas.

THROUGH the breaking of a dam, brought about by the heavy rains, the town of Voiron, near Grenoble, has been the scene of most serious floods, several lives having been lost. It appears that the small River Morge, on which Voiron is situated, rose suddenly to the height of 18ft., causing a dam just above the town to give way, and the water rushed down in a terrific torrent. Two bridges were washed completely away, others were greatly injured, while several mills and factories have been destroyed, the amount of damage done being estimated at 10,000,000 francs. Voiron, which has a population of 12,000, is now without gas, and as many as 4000 men are thrown out of work by the washing away of the mills and factories which stood on the banks of the river.

FROM further particulars to hand respecting the electric light which is to appear on the central tower of Lincoln Cathedral on the night of the Jubilee, it appears it will be 20,000 candle-power more brilliant than in 1887. Altogether there will be 42 arc lamps, each of 2000 candle-power, or a total blaze of 84,000 candle-power. Thirty-six of the lamps are to be used in surrounding the top of the rood tower, ten appearing on each of the three sides, east, south, and west, and six on the north, the remaining six to be erected on a scaffold in the centre of the tower, 30ft. higher than the 36 others. The arrangement of the lamps is far more effective than in 1887. Six are of a much greater altitude, and every alternate one is to be enclosed in a glass globe, so that the light will not be subject to the variations of wind. Given a clear night, therefore, the glare will be visible for some hundreds of miles. The lights are to be taken from a large dynamo, which has been removed to the Dean's garden, on the north of the Cathedral, where it will be driven by a compound portable steam-engine of about 70 h.p.

CHELSEA sunsets are famous all the world over, and to imitate their glowing colours forms the ambition of hundreds of artists; but when they are accompanied with the unattractive odours which come from heaps of refuse cast indiscriminately on the river when the tide is low, the pictures of the Reach prove much more enjoyable than the reality. Painters are beginning to complain that the disreputable condition of the stretch between Battersea Bridge and Cremorne Tap threatens to deprive residents of these glorious sinking suns and strangers of their counterfeit presentment, because the odours which arise from the mud of the banks prevent the former from leaving their houses to witness them, and drive away the artists who desire to transfer the scene to canvas. The subject was discussed at the meeting of the Chelsea Vestry, and a communication was received from the Thames Conservancy in which it was suggested that the Chelsea Vestry should endeavour to prevent the deposit of refuse in the river, and it was agreed to ask the Commissioner of Police to issue instructions to the constables to deal properly with offenders. With the aid of a few vigilant policemen the sunsets of Chelsea may be expected to regain their old magnificence and charm.

THE place of M. Billotte's landscapes has been taken at the Goupil Gallery by about sixty paintings and drawings by Mr. J. Buxton Knight. Mr. Knight is a devoted student of nature, and his work is said to be done entirely in the open air. He is a lover of broad, rich effects, which he paints with a bold brush and a palette in which reds, browns, and purples predominate. Probably he would call himself a follower rather of Constable than of Turner, and he has many points of contact with the French landscapists of the day, among whom, if we mistake not, he has sometimes worked. It is difficult to select where everything is so sound in intention, but, perhaps, the little pictures of the golf ground of West

Drayton and of the neighbourhood of Charleywood, and the water-colour sketches of Ramsay, Dover, and Worthing are as characteristic as any.

IN one of the best positions in Park Lane the late Mr. Barnato elected to build his house. Some idea of the place can be given by saying that the freehold cost £70,000, the building £41,000 more, and the interior decorations nearly £30,000. It is a five-story structure, built of Portland stone, and commanding one of the finest prospects in London, the Crystal Palace in one direction and Highgate in another. The work of preparing the site for the superb building which now attracts the notice of every passer was begun in October, 1895, the actual building operations not being commenced until a few weeks later, the architect being Mr. T. H. Smith and the builders Messrs. Colls and Son. The house includes a ball-room—a magnificent one, with 2000 square feet of dancing floor—two drawing rooms, a conservatory, winter garden, dining, reception, morning, and billiard rooms, and a splendid hall. The first thing to strike the visitor is the grand marble staircase, with its statuary and ornaments, the wonderful balustrades, and the dadoes in wainscot oak. This staircase is four flights in length, and is lighted by a glass dome in the top of the house. The style of the interior is Renaissance, tinged with the slightly more florid taste of Louis XIV., the characteristics of which are greater freedom of ornamentation, ivory white and gold finishing being everywhere used, with a fine effect of lightness and elegance. Both the inside and the outside of the mansion might be described as a free treatment of the early Italian Renaissance, adapted to modern requirements, the statuary and carving being carried out in harmony with the style of the seventeenth century. All the floors are heated by hot water radiators.

It is probably not generally known that one result of Mr. Tate's new Gallery at Millbank is to be the destruction of the National Gallery, as we know it, at Trafalgar Square. The work has begun already, and the carpenters are now busy in the west wing of the gallery taking down and removing the pictures destined for Millbank. The selection does not seem a very happy one, nor is the principle which guides it quite intelligible. If our National Gallery is to harbour any of our own modern masters—which is surely a desirable arrangement—the collection, though small, says the Daily News, might at least be made representative. There is a great deal we would gladly see relegated to the new building, works that seem a little out of key with their present surroundings, and yet examples of our own school too characteristic to be passed by. One may be glad enough to miss from one gallery and to recover in the other Maclise's "Hamlet," Leslie's "Sancho Panza," Goodall's "Village Holiday," Stanfield's "Zuyder Zee," Webster's "Dame School." Productions of this kind are, as it were, dates in the history of English Art.

THE choice collection of old mezzotint portraits after Sir Joshua Reynolds, formed by the late Mr. Henry Tootal Broadhurst, of Beauchamp Hall, Leamington, came under the hammer at Messrs. Christie, Manson, and Woods' last week. The principal lots were as follows:—Mrs. Abington, as "The Comic Muse," whole length, by J. Watson—150 guineas; Mrs. Beresford, with the Marchioness of Townshend and the Hon. Mrs. Gardiner, by T. Watson—120 guineas; Lady Carlisle, by James Watson—160 guineas; Mrs. Carnac, by J. R. Smith, first published state—265 guineas; Lady Betty Delmé, by Valentine Green—250 guineas; Duchess of Gordon, by W. Dickinson—100 guineas; Lady Jane Halliday, by Valentine Green—150 guineas; Countess of Harrington, by the same—285 guineas; Miss Nelly O'Brien, by J. Watson—195 guineas; Mrs. Pelham Feeding Chickens, by Valentine Green—190 guineas; Countess of Salisbury, by the same—110 guineas; Viscountess Townshend, by the same—130 guineas; and the Ladies Waldegrave, by the same—560 guineas.

The last is said to be the highest price paid at auction for a mezzotint engraving. The sale also included a complete set of Turner's "Liber Studiorum," in two cases, mostly in first states—£130. The day's sale of 117 lots realised nearly £5000.

THESE are a few of the pictures that are now in course of removal. On the same grounds which most of the Landseers are left we are glad that some should be taken, and "Diogenes and Alexander," and the "Maid and the Magpie" seem a very fair choice for transportation. So, too, if a Wilkie is to be taken, "John Knox Preaching" is the one we should part with with least regret. But is it quite right to leave an artist like Müller unrepresented, or inadequately represented? If we send away the "Street in Cairo" might we not at least retain the "Dredging in the Medway"? Neither picture has as yet been removed, but both have been "selected." The National Gallery has three recently-acquired Rossetti's; we are to lose them all. At least an exception might have been made for the exquisite "Annunciation." We may still see in Trafalgar Square two examples of Fred Walker—"The Vagrants" and the beautiful "Haven of Rest." The latter for the moment hangs on a screen in the Turner Gallery, and holds its own among its imaginative surroundings. Here is a work we would be proud to show to any visitor, who, after lingering amongst the Reynolds and Gainsboroughs, might inquire what more recent English art has achieved. Both pictures are starred for removal. Is it too late to suggest that these decisions should be reconsidered?

MR. REGINALD BLOMFIELD has in the press an important book on the influence of the Renaissance upon English Architecture. We understand it is to be a comprehensive and exhaustive work, bringing the history of the movements and changes in Architecture down to the end of the last century, and is to be profusely illustrated with reproductions of drawings by Wren, Inigo Jones, and other great Architects of the period, as well as with many sketches by the author. Messrs. Bell and Sons will publish the book.

THE agitation against the Bill now being promoted by the Dock Board for the construction of a cattle jetty at Bootle appears likely to result in the Liverpool Corporation dealing in an effective manner with the long-standing question of the abattoirs, and providing at the same time a cattle market under municipal control. As to the building of new abattoirs, the Corporation has in view a spacious site in close contiguity to the north central docks, and affording all the necessary facilities for general railway communication. The continuance of the city abattoirs in their present situation in the midst of a crowded part of Liverpool is certainly not probable in any event after the Corporation lease has run out, as it will do in the course of a not very extended period. The suggested new site is free from objection on that ground, being surrounded by manufactories and warehouses, and comparatively close to the river. At a meeting of the Markets Committee of the City Council it was unanimously resolved—"That the Surveyor be requested to inquire and report verbally to a subsequent meeting of this Committee whether a suitable site can be acquired at a reasonable price of sufficient size to enable the Corporation to erect public abattoirs and cold storage premises, particularly with a view to giving accommodation for the Irish and Scotch trade; also whether a suitable site can be acquired for a live cattle market, in view of Stanley Market being closed."

MR. JOHN CASSIDY, of Lincoln Grove, Manchester, has just completed a large statue of the Queen, which is in many respects a highly interesting piece of work. The Queen is represented standing, with an olive branch in her right hand and the sceptre in her left. The dress is of lace, over which fall at either side the royal robes, and on the head is a crown. The features are treated somewhat conventionally, but the pose of the figure is full of

dignity, and the rendering of the lace, with its bold pattern, is clever. When the statue is placed in position, high up on the front of the new buildings at Belfast for which it is designed, this simple but original ornament should produce a rich and pleasing effect, and will at any rate save the statue from the reproach of being monotonous or commonplace, like so much of the sculpture in our streets and squares. The figure is carved out of greyish white Portland stone—a somewhat intractable material that must have added considerably to the difficulty of the task.

THE mace which Messrs. Elkington and Company are preparing for presentation to the City of Birmingham will be completed in about a month's time, and promises to be a fine example of Birmingham Art metal work. It will be of silver gilt, and will weigh between 150oz. and 200oz. The design is by Mr. A. Williams, while the execution is chiefly by Mr. Thomas Spall. The head or bowl portion of the mace is divided into four panels, one of them bearing a bold representation of the city arms, while the others are occupied by emblematical devices, in which figure respectively the rose of England, the thistle of Scotland, and the Irish harp and shamrock. The panels are divided by leafage of oak, emblematical of strength. An open Imperial Crown surmounts the head. This portion of the mace is joined to the stem by graceful brackets, formed out of the figure of Britannia, while the stem, suitably divided by bosses, will have spiral repoussé enrichment of oak and laurel. In the terminal boss will be inserted a crown piece of the present year's coinage.

The thirteenth Centenary Fund for the Restoration of Canterbury Cathedral now amounts to close upon £17,000.

A MARBLE bust of the late Master of Balliol has been placed in the gallery of the Bodleian Library by the Jowett Memorial Committee.

At a recent meeting of the West Bromwich Guardians it was decided to spend £2000 in extending the West Bromwich Workhouse.

WIGAN is commemorating the Jubilee by the erection of a technical college at a cost of £40,000.

MR. EMERSON BAINBRIDGE, M.P., on Wednesday last laid the foundation stone of a new Town Hall at Kirton Lindsey.

SIR BLUNDELL MAPLE, M.P., has erected at Harpenden a Home for the temporarily invalided, and Almshouses or Homes of Rest for the aged.

THE Nottingham Town Council has decided upon purchasing the local tramways. The proprietors' shares are to be acquired at par value, the total cost involved being £80,000.

THE foundation stone of a new Roman Catholic Church was laid at Beverley on the 15th inst., and at Kirby Moorside a Roman Catholic Church, which has recently been erected, was opened for service.

THE Court of Assistants of the Drapers' Company has offered to erect a building, at a cost of £15,000, to accommodate the Radcliffe Library at Oxford University, which has outgrown its accommodation.

ON the report of the Standing Joint Committee, the work of the Worcester County Council has necessitated a considerable enlargement of the county buildings, and it has been decided to add a story to either wing, a tender being accepted for the completion of the work for £3197.

A NEW Free Church has been erected at Craigneuk, Wishaw. The Architecture of the new building is a type of Gothic similar to some of the early Churches. Its interior is plain but comfortably furnished. The Church is seated for fully 500, with a vestry and hall to accommodate 150, and the estimated cost is £2150.

MESSRS. CLEMENT WELER and LOCKER, of Birmingham, announce for sale an interesting collection of pictures, including representative works from the brush of Peter Graham, Sidney Cooper, G. H. Boughton, Charles Jones, B. W. Leader, Frank Holl, John Pettie, McWhirter, H. Pennell, Phil. Morris, Erskine Nicol, and other painters of high repute.

## Professional Items.

**ARBROATH.**—Alterations are at present being carried out by the School Board at Keptie School. These consist of a considerable extension to the school accommodation and various improvements on the school building. The new room will contain 75 places. Besides this classroom several internal alterations are being made in the school. With a view to making some improvements, the infant department has been altered and enlarged. Then the front classroom on the east side has been enlarged by clearing out the female teachers' room, and a new room and lavatory have been formed in the large lobby and coal-house on the east side; a new entrance from the front has also been provided. A new system of heating has been introduced, the whole school now being warmed with hot water instead of open fires. A new entrance for carts is being formed from Keptie Street, and the drainage of the school is being entirely renewed. The following are the contractors:—Mason work, Alexander Reid; joiner, A. M. Soutar; slater, John Mitchell and Sons; plumber, John Rayne; plasterer, Middleton and Donald; painter, W. L. Grant; heating engineer, James Keith—all of Arbroath. Plans have been prepared by Messrs. Carver and Symon, Architects, Arbroath and Forfar, and the work is being carried out under their superintendence.

**BILLINGBOROUGH.**—The Church of St. James's at Aslackby, near Billingborough, which has been undergoing an extensive restoration for some time, has just been reopened. The Church, which possesses architectural features of considerable antiquity, and has for many years been greatly neglected, has now been put into a thorough state of repair. The interior has been almost entirely remodelled to plans prepared by the late Mr. James Fowler, of Louth, and since carried out under the superintendence of his son, Mr. Reg. Fowler. The contractors were Messrs. Walter and Hensman, of Horncastle. Upwards of £800 has been spent on the work.

**BIRMINGHAM.**—The new organ which has been placed in St. Chrysostom's Church, Birmingham, in commemoration of the Queen's long reign, was formally dedicated on the 16th inst. by the Bishop of Worcester. The instrument is a two-manual one, by Eustace Ingram, London. There are thirteen stops on the great organ, eleven on the swell, two on the pedal organ, three couplers, and six composition pedals. The pedal action is pneumatic.

**DORRIDGE.**—The new portion of St. Philip's Church, Dorridge, Knowle, was dedicated on Wednesday last. The committee appointed to carry out the scheme entrusted the work to Mr. J. A. Chatwin, Architect, Birmingham, who designed a new chancel, to be built of stone, with chancel aisle, organ chamber, and vestries. The new buildings have been joined to the old Church. The ultimate intention is to substitute a stone nave, aisles, and tower for the present brick nave. The total cost of the completed edifice will be between £5000 and £6000.

**DUDLEY.**—The alterations and additions to the Guest Hospital, including the provision of an operating room, two small wards on the women's side, increased accommodation in the female wards, new laundry fitted with steam appliances, and the remodelling of the kitchen arrangements, which, with furniture and fittings, have entailed an expenditure of about £4000, are now completed, and will be opened this week.

**ECCLESFIELD.**—The new Wesleyan Chapel, of which the foundation stones were laid recently, has a frontage to the main street, and is being constructed by Messrs. J. Mastin and Son, of Cavendish Street, Sheffield, from the design of Mr. Herbert W. Lockwood, Architect, of Pinstone Street, Sheffield. The building consists of a nave and transepts, with

a large organ and choir gallery, and accommodates on the ground floor and in the gallery, which occupies three sides, 650 people. The work externally is of rock-faced stone, with ashlar dressings, and the style adopted is Renaissance in feeling. In the centre of the front is a large, deeply-recessed double doorway, under a moulded and enriched arch, with stone cornice and balustrade. Over this is a three-light window, flanked by engaged columns, and finished with a segmental pediment. Right and left of a spacious central vestibule are wide stone staircases, leading to the gallery, and forming semi-circular projecting bays, filled in with mullioned windows, and finished with stone cornice and balustrade. The side elevations have arched and mullioned windows. All the windows are to be glazed with leaded lights, in Cathedral tints. The internal woodwork is to be of pitch-pine, varnished. The ceiling is to be panelled and moulded in pitch-pine. The method of heating will be of low-pressure water. The old chapel is to be turned into a school, and the cost of the whole scheme will be about £3000.

**EDINBURGH.**—The reconstruction of the Waverley Station continues to be pushed forward as rapidly as possible. The booking-hall has already been completed. Built from the plans of Messrs. Blyth and Westland, the new booking-hall is alike spacious and handsome, the ornamentation of the interior being of a very elaborate kind. The building is of the French Renaissance style of Architecture, and measures 75ft. square; it rises to a height of 30ft., having a dome in the centre of the roof, surrounded by eight flat cupolas. Prudham stone has been used exclusively in the erection of the hall. The beautiful woodwork of the roof is composed of wainscotted oak, the intervening panels being filled in with Tyne-castle tapestry of pretty design and colour. The large centre cupola is of good design, the frieze being well brought out with semi-relief figures in gold on a coloured ground. The booking-office itself, which is placed in the centre of the hall, is also a handsome structure. It is composed of wainscotted oak, and is richly carved in keeping with the general artistic surroundings. Octagonal in shape, the office, in so far as convenience and suitability for its purpose is concerned, is probably the most complete of its kind in the country, as assuredly the booking-hall is as a whole. The design of the mosaic tile flooring is elaborate. Ferguson's patent Carlisle fire-proof flooring has been used, and the outside protecting cupolas that lie over the flat ones are glazed with Pilkington's patent wired glass. The contractors for the booking-hall are Messrs. G. and R. Cousin, Alloa; the joiners, Messrs. Drysdale and Gilmour, Edinburgh; the tapestry decorations were by Mr. Scott Morton, Tyne-castle Works Company, Edinburgh; while the mosaic tile floor was laid by Messrs. Doulton, London.

**ELGIN.**—A new hall, erected in Greyfriars Street, Elgin, was opened recently. Messrs. Reid and Wittet, who were the Architects, adopted the Scotch baronial style. The mason work is in rubble, rock-faced, with crow-stepped gables, the side wings being relieved at the top with a boldly moulded stone balustrade. The main hall measures 71ft. by 39ft. and is 25ft. high. It has heavy roof principals, of which the laminated ribs and the beams and struts are exposed, supported on artistically cut stone corbels. The main hall will seat 540 people, and the gallery 180. At the north end of the main hall there is a smaller hall measuring 32ft. by 22ft., and 13ft. high, seated to accommodate about 150 people. In the west wing of the building there is a still smaller hall or room, 25ft. by 19ft. and 13ft. high, with accommodation for about seventy people. There are also cloak rooms, lavatories, &c. The heating apparatus has been placed in the basement, the whole building being warmed, when necessary, by low-pressure water-pipes. The contractors were:—Masons, Messrs. Davidson and Hay, Elgin; carpenters, Messrs. A. and W. Dunbar, Elgin; plumber, Mr. James Ross, Elgin; slater,

Mr. George Ogilvie, Elgin; plasterer, Mr. George Gray, Elgin; painter, Mr. William Fordyce, Elgin; heating engineers, Messrs. Mackenzie and Moncur, Edinburgh; iron work, Mr. George Souter, Elgin.

**FINCHLEY.**—The National Hospital for the Paralysed and Epileptic has been able to extend materially its scope by the addition of a new home at Finchley. The house itself is conveniently placed upon an open site acquired from the Ecclesiastical Commissioners. Mr. R. Langton Cole is the Architect, and has built it in bungalow style to accommodate forty patients. It is tastefully furnished throughout, with good provision for the nursing staff. The cost has been £10,000, of which an individual donor, who did not live to see the work completed, gave £3000.

**GLASGOW.**—The new Gartloch Lunatic Asylum, erected at Gartcosh, about seven miles to the north-east of Glasgow, has just been opened. The institution has been erected by the City Parish of Glasgow at a cost, including grounds and furnishing, which will not be far short of £200,000, and it is recognised by the medical faculty as the most complete and most scientifically constructed building of the kind in the United Kingdom. For the erection of the Asylum the estate of Gartloch, extending to 347 acres, was purchased, and the plans of Messrs. Thomson and Sandilands, Architects, Glasgow, having been accepted, the building was commenced in September, 1890, the construction of the institution having thus taken nearly seven years.

**GRANDTULLY.**—A new school was opened at Grandtully on Thursday week, the old building at Ballinluig, Grandtully, having been condemned by H.M. Inspector. The accommodation is for 130 pupils. A dwelling-house for the teacher has been erected near the school. It is a plain, substantial structure, with suitable accommodation. The following is a list of those who have carried out the work, viz.:—Mason work, Charles Robertson, Pitlochry; joiner, W. R. Reid, Aberfeldy; slater, W. M. Dow, Murthly; plumber, A. J. Menzies, Aberfeldy; plaster work, Thomas Stewart, Aberfeldy; bellhanging, John Bryden and Son, Dundee; iron work, P. Murray, Strathay heating, G. H. Nicoll and Company, Dundee; painting, John Simpson, Aberfeldy. The buildings were erected from plans by Mr. William Bell, Architect, Aberfeldy.

**HEELEY.**—Extensive alterations have been made at Heeley Parish Church. A new aisle has been added on the south side, and the Church has been thoroughly renovated. The windows are of cathedral glass, with tinted borders. The heating and lighting apparatus has been remodelled and improved, and in the south transept an opening has been made for a new organ front to face the new aisle. A new oak pulpit, with modelled base of Bath stone, will shortly be completed. The total cost of the improvements and additions to the Church amounts to £1200.

**HETTON-LE-HOLE.**—A new Conservative club building has been erected on a prominent site near the railway station. The frontage is about 48ft., and the depth is nearly 100ft. The building stands about 12ft. back from the highway. The principal entrance is at the middle of the front, and is a wide stone-arched doorway, surmounted by a modelled head of the Queen. The building is of two stories, and contains a billiard room, reading and committee rooms, on the ground floor, divided by a patent sliding and folding partition, so as to make one room when required; a smoke room, also on the ground floor, near the entrance, with a communication to the bar; a caretakers' room; a kitchen and out-buildings in the rear, on a level with the reading and smoke rooms. There are two bedrooms above the kitchen. Mr. Frank Caws, Architect. The contractor is Mr. Stephen Branton.

**HOLMFIRTH.**—Colonel Hasted, R.E., Inspector under the Local Government Board, held an inquiry at Holmfirth on the 16th inst. respecting the application of the Urban District Council for sanction to borrow £19,877 for the purposes of sewerage and sewage disposal.—Mr. Lomax, clerk, stated that the Council had an agreement to purchase ten acres of land at Neilleys from the Earl of Dartmouth for £1500, and the scheme would drain the whole of the district at a cost of £19,877, inclusive of the treatment of partially clarified trade effluents.—Messrs. Beesley and Barraclough, the engineers, explained the scheme.—Mr. Mills opposed on behalf of the Honley Urban District Council, as the scheme proposed to treat the sewage of part of the districts of Thurstonland and Honley, and the whole of the district of Netherthong, and they were not included in the present plans. Honley did not object to the outfall works being placed in their district, but asked to be protected from any nuisance from sludge being deposited.

**HULL.**—The ceremony of laying the foundation stones of new baths for the Eastern Division of Hull was recently performed by the Mayor. The site is in close proximity to the James Reckitt Public Library, on the Holder-ness Road, and the building will be in the Renaissance style, in red brick, with buff terra-cotta facings, making a handsome frontage. A large bath 96ft. by 30ft. will be provided, with a depth of water 6ft. 6in. There will also be a boys' bath 60ft. by 30ft., with a depth of 4ft. 6in., and thirty-one private baths. Very extensive arrangements have been made for the convenience and comfort of bathers. The whole design is by the Borough Engineer (Mr. A. E. White), under whose superintendence the work will be carried out, and the cost, exclusive of land, will be £12,500.

**KIRBYMOORSIDE.**—The new Roman Catholic Church recently opened is on the road from the station to the town, and is erected from plans by Mr. Bernard Smith. It is capable of seating 120 persons, and is of the Early English style of Architecture, which flourished at the beginning of the thirteenth century. It consists of a sanctuary, the internal dimensions of which are 16ft. by 16ft., and 29ft. to the ridge. The nave is 40ft. 1in. by 20ft., and is 31ft. to the ridge. The roof is a groined one. There is a triple-lighted window well up in the east wall, and there is also a triple-lighted window in the south wall of the sanctuary, and in the east wall are a piscina and a recess ornamentally carved. Three steps of white Carrara marble lead from the nave to the altar, and the sanctuary is paved with encaustic tiles to correspond with the surroundings. The nave and vestry are paved with wood blocks. The font is exceedingly handsome, and consists of a polished West Riding stone base, shaft and capital of Abbey Roche magnesian lime-stone, and an octagonal basin of Carrara marble. The roof timbers are of Memel, with trusses springing from moulded corbels, groined and divided into panels. The exterior of the roof is covered with best Welsh slates. The contractor's work has been carried out by Mr. Anthony Lyons, of Norton, Malton.

**KIRKCALDY.**—At a meeting of Kirkcaldy Police Commission, it was moved that the Commissioners entertain the scheme for the formation of a direct carriage road from Victoria Road to Nairn Street by erecting a bridge, which it is estimated would cost £10,000. In the discussion which followed, Councillor Lockhart stated that the money could be more advantageously spent in other parts of the borough, and that this proposed road was not at all necessary. The motion was agreed to without a division.

**LEITH.**—The Leith Dock Commissioners are at present considering the question of erecting a warehouse at the docks for the storage of grain. Messrs. T. Robinson and Sons, Rochdale, have submitted for their inspection a working model of a warehouse on the silo system. The silos are a series of vertical cells

about 10ft. in diameter, from 50ft. to 70ft. in height, partitioned by either timber or thin brick. Each cell is built on an iron hopper-shaped bottom, from which the grain is taken out.

**LEEDS.**—New day schools which have been erected in connection with St. Luke's Church, North Street, Leeds, have been formally opened by Mr. A. T. Lawson. The schools have been built on the central-hall system, with the classrooms arranged on either side. There are four classrooms, each 25ft. by 20ft., and two 28ft. by 20ft. The central hall is 60ft. by 28ft., and at the south end, opposite the entrances, is a raised platform, divided from it by patent swivel partitions, so as to form a teachers' room, or a platform and stage when the central hall is being used for parochial or public purposes. Entrance to the schools is gained by two porches and lavatories, 18ft. by 16ft.; which are built close up to the Skinner Lane frontage. The building is heated by means of hot-water pipes and coils; and it is exceedingly well lighted by lofty mullioned and transomed windows. The lights to the Skinner Lane elevation are contained beneath pressed brick arches, the spandrels being filled in with diaper bricks to special design. The central hall is not only lighted by large windows in the gables, but by clerestory windows at the sides. The whole of the buildings are faced with pressed brickwork, and the playgrounds are concreted. The cost of the building per child is less than half the cost which obtains in the case of the Board Schools in the city. The buildings have been erected from the designs and under the superintendence of Messrs. Smith and Tweedale, Architects, South Parade.

The carrying out of the plan for the covering in of the open space between the blocks and the fish depot at the Leeds Kirkgate Markets has now reached an advanced stage. The Committee decided to put up a lofty roof, in four bays, resting upon high columns of cast iron, and glazed with rough plate glass. One of these bays has been completed. A second bay, or span, will be completed in a fortnight's time, and the work of erecting the two others will be pushed on as rapidly as possible. The estimated total cost will be about £8000. Messrs. Braithwaite, of Swinegate, are the contractors for the whole of the work.

**LISKEARD.**—Matters pertaining to the pulling down of the present dilapidated Church tower at Liskeard, and the rebuilding of a new one, are at this moment very much strained, in consequence of the Chancellor refusing to grant a faculty for the purpose unless the new tower to be erected is built of precisely the same design and height as the present one, and with the old material.

**NEW SPRINGS.**—The new Church of St. John the Baptist has just been completed. The plan of the Church is unusual. There are no nave aisles, but a broad nave, which is drawn to an apsidal ending towards the east. The centre arch of the apse opens into the chancel. The side skew arches open respectively into the north and south chancel aisles. The south chancel aisle is regarded as a chapel for services in which only comparatively few take part; but it is so arranged as that its occupants can conveniently join in the service when the Church is full. Near this chapel is a door. The north chancel aisle, marked off from chancel and nave by arched traceried screens, is divided into clergy and choir vestries and organ chamber. At the west end is a central tower, the lower story of which is four steps above the nave floor, and forms the baptistery. On the north side, near the west end, is the spacious main entrance porch, provided with a narrow side door (in addition to the wide front door), so that in cold weather the inrush of cold air may be checked, and no direct draught be felt by anyone. Looking eastwards from the nave, there is seen the bold chancel arch carried on massive circular pillars, and flanked by the two side arches of the apse. The east window has three lights of unusual width, and

tracery above. Looking west from the chancel steps is seen the lofty arch of the baptistery, with a wide one-light window beyond. The window is filled with glass of soft tints, the main device being a large cross. The east chancel window is of a similar glass in pattern, with symbols and devices. But the centre light, which is 3ft. wide, is filled with fine stained glass, the work of and the gift of Messrs. Heaton, Butler, and Bayne. The fittings generally are of pitch-pine. The work throughout has been designed and superintended by Mr. Medland Taylor, Architect, of Manchester. Mr. C. B. Holmes is the builder.

**NOTTINGHAM.**—The tender of Mr. John Hutchinson for the erection of the new Constitutional Club in Market Street, Nottingham, has been accepted. Mr. Hutchinson's tender, which was the lowest, amounted to £10,652. The contract for the foundations, basement, sub-basement, Conservative offices, ladies' room, &c., was let separately some time ago to Mr. J. W. Woodsend, and he has now completed his portion of the work.

A chancel screen and richly carved choir stalls are being erected at St. Peter's Church. The work is rapidly approaching completion, and it is hoped will be entirely finished before the visit of the Church Congress to Nottingham in October. The work is in the hands of Mr. J. W. Woodsend, of Castle Gate, the designs having been prepared by Messrs. Evans and Son, Architects, of Nottingham, the estimated cost exceeding £1500.

**PAIGNTON.**—A notable pulpit was recently dedicated by the Vicar of Paignton. The stairs and base are of Mansfield stone. Supported on shafts of green Connemara marble is a single piece of the same stone, weighing about 30cwt., which forms the floor of the pulpit. Above this comes an incised course of a light coloured, variegated marble. The panels are red marble, with an inlaid design of green and dark marbles. The coping and battlemented canopies of the niches are of the same marble as the lower course. On the face of the panel over which the preacher would generally look is an alabaster cross with the figure of our Saviour. On the north side of this are three niches and on the south side two. The background of the niches is filled with gold mosaic, of the English kind used in the decoration of St. Paul's Cathedral.

**PETERHEAD.**—The new Parish Home, which it is proposed to erect at Peterhead, will cost a little over £2000. The building will be of granite, two stories high, with projecting wings at either side and in the centre, and a back wing of one story height. It will be built on the same site as the present, running parallel with King Street, and the frontage towards the south. The entire length of frontage will be 108ft., the depth of the main building 30ft., the side wings 55ft. each, and the ground space of the centre and back wings about 70ft. On one side of the entrance lobby, in the centre projecting wing, is to be a committee room, and on the other side the governor and matron's private parlour. The whole space between the committee room and the east projecting wing is set apart as a day room for the male inmates, while on the other side is the women's day room. On the male side there is a dormitory, 21ft. by 17ft., containing eight beds; and another, 17ft. by 16ft., with six beds; while on the other side there is the same amount of accommodation.

**ROTHERHAM.**—New choir seats and chancel screen erected in the Rotherham Parish Church, in commemoration of the blessings of H.R.H. Queen Victoria's reign of sixty years, has been dedicated. The scheme, which also includes the re-hanging of the bells, the renovation of the gas coronas and standards, and other improvements, has been undertaken at a cost of £500. The whole of the woodwork has been carried out by Messrs. Johnson and Appleyards, of Rotherham and Sheffield, from designs by, and under the superintendence of, Mr. James E. Knight, Architect, of Rotherham.

**ST. HELEN'S.**—Colonel D. Gamble has intimated his intention of the erection of a parish room and caretaker's house, in connection with St. Mark's Church, at a total cost of about £1500. Plans for the building, which will be erected on the vacant land between the Church and the Park Hotel, have been prepared by Mr. James Gandy, and the contract for its erection has been let to Mr. Peter Tickle, builder, for the sum of £1400. The new parish room will be in the same style of Architecture as the Church, and the caretaker's house, which will have a handsome bay window erection, will front to North Road.

**SWANSEA.**—The new Swansea Metal Exchange recently opened was designed by Mr. H. W. Wills, and the contract was given to Mr. Thomas Davies, the total cost of the building being £3500. The Exchange is built in Queen Anne style, and carried out in red brickwork, with stone dressings. The main entrance is from Fisher Street, though, perhaps, the most convenient means of ingress will be from Wind Street, through the Cambrian office—a right-of-way having been secured by the members of the Exchange. The principal entrance is both spacious and imposing, large columns being on either side, whilst above there is some excellent carving, with a centre figure allegorical of Swansea. The corridor is tiled, and leads into the large exchange, the inside of which is 50ft. by 40ft., and 20ft. high, and has a carved elliptical roof. It is splendidly lighted by means of large elliptical windows, containing upon them the arms of Swansea. The building also contains two other rooms, arranged in suites for offices, and a notable feature about it is the fact that the members of the Exchange, having a desire to promote the tin-plate industry, had the roof covered with tinplates instead of slate.—At a meeting of the Swansea Harbour Trust, Mr. Griffith Thomas presiding, it was reported that the committee had let the contract for the North Dock new entrance works at £40,024, to Mr. L. P. Nott, of Manchester, who had agreed to complete the whole of the work by the 1st of January, 1901.

**STAFFORD.**—In consequence of the present Board School being overcrowded it is suggested that an infants' school be erected, which will materially relieve the present school.

**TUNBRIDGE WELLS.**—The new parochial schools of St. Barnabas, Quarry Road, Tunbridge Wells, were formally opened last week. The schools have been erected from designs by Messrs. H. H. and E. Cronk, the Architects, and built by Mr. W. T. Judd, and will provide room for 450 children of St. Barnabas parish. The building, a lofty, spacious structure, is of red brick with stone facings, and is two stories high. One room is 71ft. by 22ft., with means of subdivision when needful, and a class room 25ft. by 24ft., with 15ft. pitch. The building is fireproof. Pitch pine wood has been used inside, and gives a pleasing appearance to the structure, which is well ventilated and lighted.

**WALSALL.**—Mr. Rienzi Walton, on behalf of the Local Government Board, held an inquiry at the Endowed Schools, Aldridge, on Wednesday, with reference to an application by the Walsall Rural District Council to borrow £4500 for sewerage purposes.—Mr. Lewis explained that the Council had been obliged to adopt a comprehensive scheme for the sewerage of their district. A report issued by the County Council in 1895, as to the pollution of certain streams, was also another element in the matter. The scheme upon which the inquiry was being held had been prepared by Mr. Willcox, C.E.—Mr. Jones, in opposing, contended that all that was necessary for Aldridge could be provided at much less cost than that proposed to be incurred by the Council.—Mr. Clarke contended that the ratepayers had had no opportunity of considering the scheme, but were of opinion that a much less extravagant one might be devised.—The Inspector afterwards went to visit the area.

**WEST HARTLEPOOL.**—A bronze statue of the late Mr. Ralph Ward-Jackson was unveiled at West Hartlepool a few days since.

The statue was designed by Mr. Onslow Ford, R.A., is of bronze, 8ft. in height, and was cast from the model of Mr. Ford by the Cire Perdue process, by Messrs. Rovini and Paulanti, Parson Green, London. Mr. Jackson's figure is in an oratorical attitude, standing upon a 7ft. pedestal of Portland stone. The squares are adorned with bronze shields.

## Enquiry Department.

### A SANITARY POINT.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—The enclosed rough sketches are intended to indicate three methods of connecting a waste pipe from a lavatory basin with the drain. I sent them at the foot of a letter to my chief, asking him to mark the one he preferred. The answer was "Finish it as No. 1, Nos. 2 and 3 were insanitary and could not on any account be sanctioned." I really should like an expression of opinion from yourself, through your Enquiry Column. CLERICUS.

In my opinion, as drawn, sketch No. 1 is the most sanitary, but it has the objection of discharging the waste on the top of the gully, which in many positions is most unsightly. No. 3 would obviate this difficulty, but the lead trap immediately under the lavatory basin must be ventilated if this method were pursued, and then I see no objection to it;

FIG. 1.

FIG. 2.

FIG. 3.

indeed, I should prefer it personally to No. 1. A very able paper on the subject of Plumbers' Work and Sanitation was read before the Architectural Association recently by Mr. S. S. Hellyer, and I would advise your reading it. The paper appeared in recent issues of the BUILDERS' JOURNAL.—ED.

### R.I.B.A. EXAMINATIONS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—As I intend studying for the preliminary R.I.B.A. I shall be obliged if you or any of your readers can inform me where I can get two or three years' examination papers, so that it will give me a better idea of the scope of the Examination. Do any of the London booksellers publish them in book form? Thanking you in anticipation.—Faithfully yours, STUDENT.

The Institute Examination papers are not published in book form so far as I am aware. I should advise you to write to Mr. Church Howgate, 70, Gower Street, W.C., who can supply you with any information you desire regarding the Examinations.—ED.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Could you kindly inform me, through your "Enquiry Department," who are the publishers of "Dent's Chemistry of Building Material"? Also the price, and its use as a text-book on "Physics as Applicable to Building" in reading for the Intermediate

Examination of the R.I.B.A. A reply will much oblige yours truly, PROBATIONER.

The book you refer to was published in India, but is now out of print, and I think you would find some difficulty in obtaining a copy. The only one I know on this subject is a small pamphlet entitled "Notes on Chemistry of Building Materials," by A. J. Evans and Albert Grenville, the publisher being C. Bateman, 1, Three Tons Passage, Paternoster Square, and a series of papers that appeared in the Builder some time since, commencing Jan. 7th, 1893, and continuing, at intervals, until June 17th, 1893. Beyond this I do not think there is anything published, as this subject, though forming one of those required for one of the Civil Service Examinations, has received very scant attention.—ED.

### CHURCH BUILDING AT YEOVIL.

THE new Church of St. Michael and All Angels, Pennill, stands upon one of the most commanding spots in the neighbourhood, and is of distinctly West Country character, in the fifteenth century style of Gothic. It is built wholly, within and without, of warm tinted Ham Hill stone, and has been designed by Mr. J. Nicholas Johnston, Architect, of Yeovil. The South Western town is square and embattled, rising some 80ft. The original drawings showed its battlements capped by carved pinnacles, and these were duly erected, but during the great gale last year several of

them were blown down, and so it was deemed prudent to remove the others to prevent any possible accident in the future. Although thus shorn of its ornamental appendages, the tower's design generally, with its quaint octagonal angle bell turret at the south-west corner, has not suffered by the alteration. On plan the Church consists of the tower, with nave and north and south aisles, the latter divided from the former by arcades of five bays on the north side and of four on the south. There are also two bays north and south of the chancel. These arcades are supported by clustered columns. The organ chamber is on the north of chancel, east of the north aisle, and there is a spacious vestry east of it. The walls of the aisles, which have lean-to roofs, are embattled and substantially buttressed, and the windows, especially that at the east end (a five-light one), are large, and filled by gracefully designed tracery. The nave and chancel roof are of the west-country type of "waggoned" open timber, and are panelled. The chancel screen stands upon a dwarf stone wall, and is divided into two bays on either side of the central one, which itself forms the approach, and has double gates of artistically wrought iron, by Messrs. Hart, Son, and Peard, of London. The tracery is light and graceful, and the upper parts are most ornately carved and surmounted by pierced cresting. The general contractor was Mr. H. W. Pollard, builder, of Bridgwater, and about £10,000 has been spent on the building.

## Trade and Craft.

### A NEW ALLOY.

An exhibition was given last week at Winchester House, Old Broad Street, by the Peerless Metal Company Limited, of 38, Parliament Street, Westminster, of a variety of articles made in a new alloy—the "Peerless Metal"—to the production of which the firm mentioned exclusively devotes its attention. The "Peerless Metal" closely resembles old silver in colour, but it is claimed to be greatly superior to that metal in point of strength and durability. It does not, it is stated, oxydize from atmospheric influence, and it is not affected by salt water, while, being a solid metal of uniform quality and colour throughout, its appearance is not impaired by wear, as is the case with plated articles. It may be used for practically all purposes in which brass or silver finds a place, and has advantages over iron and steel in certain industrial operations. It can, it is stated, be manufactured and sold profitably at a cheaper rate than the ordinary white metals or German silver, and the facility with which it can be rolled, drawn into tubes and wire, or brazed and soldered, will commend it to manufacturers of all classes of articles. The goods produced in this metal which were exhibited at Winchester House ranged from pens and vesta cases up to church bells, bedsteads, and complete sets of parts for building a bicycle.

### NAVAL ARCHITECTURE.

One of the most difficult forms of designing known is that of Naval Architecture, for it is so cramped by the exigencies of the utilitarian requirements of various classes of vessels that anything new which the Naval Architect may attempt is rather in the nature of a dangerous experiment. In these days it may be said that a Naval Architect always has to be studying something new, for he has ever to adapt the broad principles of his knowledge to new inventions, new types of engines, and new theories as to speed and safety. Naval Architects are very highly paid, and they exercise an amount of daily, almost hourly, supervision over the construction of the works they have designed, which is quite unheard of amongst ordinary Architects. It may not be known that even in the case of so-called "twin" vessels, made from the same designs and built side by side, and fitted by the same engineers, the rate of speed and seaworthiness between the two ships will often vary very widely indeed. In the case of iron ships, each plate of the vast number used in forming the contour of the vessel has to be specially cast, and each plate is numbered and sent with its order set forth in the lines prescribed by the Architect. In each shipbuilding yard there is a vast covered floor space, upon which are marked by the Architect's assistants the exact lines of the vessel in its actual size, and at every stage the drawings are made of great size and in the simplest possible form.

### INTERESTING TO BUILDERS.

Some time ago an action was raised in the Perth Sheriff Court at the instance of Edward Welsh, labourer, 212, South Street, Perth, as tutor and administrator in law of his pupil son Martin Welsh, against Messrs. Fraser and Morton, builders, for £50 damages for personal injuries sustained by plaintiff's son—a boy of eight years—through a large paving-stone having fallen on him on March 15th, 1896, during the erection of the Wilson United Presbyterian New Church in New Scott Street. It was stated that the defendants had left a large flagstone of 4ft. or 5ft. square and 9in. thick unwatched and in an unsafe condition, not properly supported, and liable to fall at any moment, and that on a Sunday afternoon the stone fell on the boy and crushed him seriously. Defendants denied that the stone was not properly supported, and said it could not have fallen unless the props had been deliberately removed, and, further, that the boy Welsh was trespassing in being where he met with his

accident, and had himself maliciously removed the props, and thus by his own contributory negligence caused the accident.—His Lordship was of opinion that the boy by his own conduct caused the accident, and that the defendants were not liable.

### MESSRS. J. DEFRIES AND SONS.

The question of street decoration and illumination is all-absorbing just now—in fact, it comes only next to the great question of the Jubilee. It was wise forethought and prudent enterprise on the part of Messrs. J. Defries and Sons, which led them to hold an exhibition last week of a few representative designs of the work they are carrying out—or rather we should now say have carried out—for the Prince of Wales, and many public bodies. To Messrs. Defries and Sons, who, by the bye, were engaged in the work of public decoration and illumination before the Queen came to the throne, must be accorded credit for a laudable attempt to substantially raise the standard of design employed in such work. Their object has been to introduce to a much larger extent than has been practical hitherto the elements of line and form as contrasted with colour and mass—to be bright and brilliant certainly, but at the same time to be artistic. Messrs. Defries' largest illumination is that of the Bank of England, and to provide the design here they have invoked the aid of Professor Legros, an Artist whose participation in the work of public decoration marks an important epoch in the Art. Among the numerous other works the firm is carrying out are the decorations of Marlborough House, every detail of which is made in cut crystal; York House, in St. James's Square; the Royal Exchange; the Junior Army and Navy Club, etc. It will be found that the effect of the illuminations is due not only to a careful consideration of the lines of the design, but also to the richness of the tints used. Two entirely new elements of illumination have been introduced on this occasion. The one technically known as "arborescent" devices, is a method of obtaining a more subdued glow than occurs with crystal, without sacrificing the richness of tint which is essential to a good effect. The other element lies in the construction, out of glass, by a patented method, of garlands of flowers, foliage, etc., which hitherto have only been made in paper or similar materials, so that they not only give the desired decorative effect by day, but also are illuminated by night, and appear as though the flowers themselves were luminous. Messrs. Defries are certainly displaying great artistic taste, and although many striking designs which they have had prepared were rejected, thus showing, as they truly remark, "how very unsatisfactory is the standard of taste by which designs are selected," their work cannot fail to charm the million.

### BUILDING DISPUTE AT BLACKBURN.

The Vice-Chancellor at the Manchester Sittings of the Chancery of Lancashire gave judgment in the case of Wilding v. Bowman, which was heard before the Whitsuntide vacation. The plaintiff, the lessee of a plot of land forming part of an estate at Pleasington, near Blackburn, claimed an injunction to restrain the owner of the estate, J. E. B. Bowden, from sanctioning the building of, and the other defendants from building, a certain class of houses on the estate referred to. The plaintiff's case was that by a building scheme made in 1856 by the defendant Bowden's predecessor in title, the estate at Pleasington was planned out for detached, or semi-detached, houses, that this building scheme was an implied contract in the leases to the plaintiff, and that the plaintiff was therefore entitled to have a proposed erection of a terrace of houses on the estate restrained. In giving judgment, his honour said the law applicable to cases of that kind was tolerably clear. If the owner of a building estate laid it out, and, in the language of Lord Macnaghten, if the public were invited to come in and take a portion of the estate, which was bound by one general law, then a person who came in on that representation was entitled to insist

that that general law should be observed. But it did not necessarily follow that the preparation of a plan and the showing of the conditions constituted a general law, binding the estate and binding the parties. Whether there was such a general law depended on the facts of the case. In the present case the leases granted to the plaintiff's predecessor in 1857, and to the plaintiff in 1885, did not themselves correspond with the plan and conditions of 1856. Then, with the exception of those leases, and one to another person, nothing had been done in connection with the development of the estate. The proposed streets had not been made, and, with the exceptions mentioned, the estate remained agricultural land up to the commencement of the building operations now in dispute. The result was that, in his opinion, the plan and conditions of 1856 were merely suggestions that were adopted by the then owner for the purpose of developing his estate if he could obtain purchasers who were willing to take it on those terms, but not a contract by him to bind the estate for the benefit of the persons who took any special portion of the land. He thought the plaintiff's own deed showed that he was not taking on the terms of any building scheme such as was set up, and if he was not bound by the building scheme, why should he come and ask that the owner of the land should be bound by it? Again, the matter was much too vague. It was said that the building scheme was for villas, but he did not know any definition in law which would enable him to grant an injunction restraining a man from erecting a house which was not a villa. Another point had been raised by the defendants, as to whether the owner in 1856, who was only a life tenant, was competent to enforce a binding building scheme. There was a good bit to be said for that argument, but it was not necessary for him to decide the point, inasmuch as he had come to the conclusion there was no definite binding building scheme such as was suggested. The action would therefore be dismissed, with costs.

### MESSRS. N. C. SZERELMEY AND CO.

"The Cause and Cure of Damp and Decay in Masonry" is the alliterative, yet no less comprehensive, title of a booklet issued by Messrs. N. C. Szerelmey and Co., now in its fifth edition. The contents are just as comprehensive as the title. The A.B.C. of the question is presented in a few pages, and valuable information on the cure of stone decay—the great cause of which has been shown to be damp—is given. What the building world wants is something which will act as an antidote to the mighty forces of damp. It is claimed, and we think rightly so, that Szerelmey Stone Liquid furnishes such an antidote. Its effect is to moderate and delay the action of damp. It fills the interstices between the particles of the stone, and it clothes the particles themselves with an inert substance impervious to moisture, acid, and alkali. Experiments carried out a few years ago in connection with the Houses of Parliament, fully proved the preserving qualities of the Liquid, which since then has been much in demand. The Company also manufacture special porcelain paints, iron paints, varnishes, &c.

MR. T. P. MARTIN, Architect and Surveyor, of Swansea, died a few days ago at Coleford, Gloucestershire. Mr. Martin was one of the best known members of his profession in South Wales, and has designed a number of fine buildings.

A STATUE, just finished by the Hungarian sculptor Danis Hasseirris, will be placed on the grave of Henri Heine, in the Montmartre Cemetery at Paris. The entire cost of this statue, it is said, will be defrayed by the Empress Elizabeth of Austria.

To the old Church of St. Mary, Todmorden, there has, during the last year, been added a handsome chancel, with organ chamber and vestries, and the old nave has been renovated. The dedication of the new chancel and the reopening of the nave will take place during the first week of July.

## SOCIETY MEETINGS.

**Edinburgh Architectural Association.**  
The Edinburgh Architectural Association on Saturday week visited Torphichen Church, the chief centre of the Knights of St. John in Scotland. Mr. Henry F. Kerr, A.R.I.B.A., who conducted the party, explained that the Hospital of the Knights was probably founded in 1153, when the order was introduced into Scotland. An old archway occupying a site under the westmost arch of the crossing was probably the chancel arch of the first Church. The rest of the mediæval remains were of Late Pointed work, consisting of north and south transepts, with a tower at the crossing, which must originally have been a bold feature, with its cape house gathered with crow steps. The vaulting of the transepts and crossing were still standing, but in some places the vaulting ribs were badly split, and some of the vaulting stones had fallen out.

The annual excursion of this Association took place on Saturday. Linlithgow was the rendezvous, and the Palace the first object of interest. In this building is work of the fifteenth, sixteenth, and seventeenth centuries, and probably it is the finest example of domestic Architecture remaining in Scotland. It is

built in the form of a square with a central courtyard. All the apartments communicate with each other and with various staircase towers. On the south side the entrance to the Palace and the Royal Chapel are situated. On the east side is the great hall, a most magnificent structure, and also another entrance of great richness of decoration. The west side is occupied with what were probably family apartments, and on the north side there are various banqueting halls, an oratory, kitchens, &c. St. Michael's Church, which was next inspected, adjoins the Palace, and consists of a nave and choir with north and south aisles, eight bays in length, a western tower, and an eastern apse. The north and south chapels may be regarded as transepts. The fine southern porch has a priest's room over it lighted by a beautiful oriel. Bonhard House, also visited, situated about two miles north from Linlithgow, is a building of the L plan, with a staircase turret in the re-entering angle. Some of the rooms have ornamental ceilings with panelled walls and handsome fireplaces. The house was built by the Cornwalls—a well-known Linlithgow family—and their arms with the date 1591 are beautifully cut on a dovecot at Bonhard. Kinneil House is an ancient possession of the Hamiltons, consisting of an

oblong keep, 56ft. 6in. by 31ft. 6in., to which wings have been added, and also a block of building to north-east, which may at one time have been a separate house. The keep walls are 6ft. thick, and the ground floor is vaulted. Frequent alterations render it difficult to assign the date of this structure. The attached building was originally L-shaped and, combined with the keep, made into one building in the reign of Charles II.

**The Architectural Association of Ireland.**—The annual excursion took place on Saturday week. The party visited Mellifont Abbey and Monasterboice. At Mellifont a couple of hours were spent measuring and sketching the remains of this fine old Cistercian foundation. The Chapter House in particular is in excellent preservation, and affords much

material for study for the Architect and the antiquarian. At Mellifont Monastery the round tower and the two well-known Celtic crosses were examined and sketched.

**Society of Engineers.**—At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on the 14th inst., Mr. G. Maxwell Lawford, president, in the chair, a paper was read by Prof. Herbert W. Unney, entitled "The Compression of Air by the direct action of Water." The author, by way of introduction, referred to the importance of obtaining compressed air by the simplest possible means. In particular he called attention to the best of all methods, being the only one whereby the compression takes place isothermally. The idea, however, he observed, was not a new one. He referred to the ancient methods in use in Spain, and stated the general principle underlying the system. He then directed special attention to the plant erected by Mr. Frizell, of New York, which gave an efficiency of 52 per cent. when tested. He stated that an abstract of these experiments was recorded in the proceedings of the Institution of Civil Engineers in 1880. The author then described a plant which has recently been erected by Mr. Taylor, of Montreal, giving an increased efficiency of 10 per cent. He gave in detail the method of impregnating the water with minute bubbles of air, the improvement being entirely due to this feature, and pointed out the alterations necessary, being confident of obtaining 75 per cent. of the power at command. He also gave records of the trials conducted, and has computed the various hydraulic losses in the

apparatus. He summarised the advantages of adopting this principle as follows:—1. The compression takes place isothermally. 2. The initial outlay, repairs and working expenses are less than by any other means. 3. It is suitable for adoption in the case of low waterfalls. He claimed that these far outweighed the objections of sinking a shaft.

**Institution of Electrical Engineers.**—The annual conversazione given by the council of the Institution of Electrical Engineers was held last week at the Natural History Museum, and the guests, who numbered nearly 1000, were received by the president, Sir Henry Mance, and Lady Mance. Among those present were Professor D. E. Hughes, F.R.S., Professor Ayrton, F.R.S., Professor Spooner, Professor R. H. Smith, Professor Silvanus Thompson, F.R.S., Professor Crookes, F.R.S., Professor Kennedy, F.R.S., Professor W. C. Unwin, Dr. John Hopkinson, F.R.S., General C. S. Webber, Colonel J. R. Jocelyn, Major McMahon, F.R.S., Major B. Scott, Major Wrottesley, Dr. O. Pyffers, Dr. W. E. Sumpner, Dr. W. Woodward, Messrs. R. E. Crompton, Horace Bell, H. Edmunds, C. E. Spagnoletti, W. G. McMillen, F. C. Danvers, J. Hooke, C. E. Fagan, A. R. Binnie, R. Inwards, H. W. S. Rentell, Kenric B. Murray, and E. W. Richards.

The new Tivoli Theatre at Dover was opened last week. It is a very ornate building, and was designed by the late Mr. C. J. Phipps. The house is fireproof, and has accommodation for 1000 persons, and there is not a seat from which a perfect view of the stage cannot be obtained.

The extensions of the buildings of the Royal Institution for Deaf and Dumb Children, Edgbaston, were opened by Lord Calthorpe on Wednesday, the 16th inst. The additions and alterations have effected a surprising change in both the internal and the external aspect of the buildings.

The foundation stone of a new manse, in connection with the Congregational Church, Ingatstone, was laid on Tuesday, the 15th inst.

A new Baptist Sunday school was opened in Every Street, Nelson, on Wednesday. The building has cost £5000, and provides accommodation for 800 scholars, including lecture halls, classrooms, and vestries.

The Blackburn Road Congregational Church, Bolton, built by Messrs. Lever Brothers, at a cost of nearly £30,000, has just been opened.

## TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

# WILSON'S "DIOPTRIC" PAVEMENT LIGHTS

FOR THE ILLUMINATION OF  
BASEMENTS, AREAS,  
CORRIDORS, &c.

THE MOST EFFICIENT  
AND ECONOMICAL TRANSMITTING  
DAYLIGHT INTO BASEMENTS.

INCREASED LIGHT WITHOUT  
INCREASED COST.

## "DRIPLESS" LIGHTS.

So constructed as to Prevent the Condensation falling on anything which happens to be below.

## WILSON'S "SAFETY" PAVEMENT LIGHTS.

These are made with lead between the glass prisms, and prevent slipping, as well as doing away with the studs.

## WILSON'S IMPROVED PATENT HORIZONTAL FLOOR & ROOF LIGHTS

# Surveying and Sanitary SUPPLEMENT.

JUNE 23RD, 1897.

## PLANNING OF SMALL HOUSES.

(Continued from page lvii.)

By H. V. LANCHESTER, A.R.I.B.A.

No. VI.

**B**EARING in mind the degree of excellence that has been achieved by so many Architects in the design of the small country house, it is with some diffidence that one ventures to supplement the works of men whose abilities in this direction are so noticeable. To name George Devey, Ernest Newton, E. J. May, C. F. A. Voysey, and G. C. Sherrin is to name only a tithe of those who have contributed to the Architectural pre-eminence of our country in this direction. While one cannot but feel the weakness of the English school in buildings requiring a bold and monumental treatment, few will dispute its claim to a leading position where the effect desired is that of homely and unpretending simplicity, interesting in detail, but kept in such harmonious restraint as to render it

absolutely in place among rural surroundings.

On account of the general high standard of the work that has been carried out on these lines, and illustrated from time to time in the building papers, I have dealt less fully with this portion of my subject than I should otherwise have done. Nevertheless, as these brief articles only deal with the practical side, they could hardly omit some examples of the smallest class of detached country houses, such as the three illustrated herewith. These can scarcely claim to be more than cottages, costing as they do but some four or five hundred pounds, while at the same time they form perfectly suitable residences for small households. Nos. 14 and 15 are not planned with regard to any limitations of site, though the frontage they occupy is not more than could be well spared in any but crowded districts; No. 16, the largest, could be placed on a minimum frontage of 35ft. With regard to No. 15 it will be noticed that the kitchen offices present some modification from the usual arrangement, the scullery being combined with the kitchen, and a pantry, where one or two could sit, being placed so as to form

a lobby cutting the kitchen off from the rest of the house; this may usefully be adopted in larger houses, and would frequently be preferred in one of this size. In other respects the plans do not call for explanation; it may be mentioned that in each case the form and construction of the roof has been considered. Nos. 14 and 15 would be covered with L-shaped roofs, having a pitch of 45° or a little over, and No. 16 would have a low-pitched roof running from front to back, thus showing a wide gable to each, or by carrying the walls a foot or so higher, the roof might be hipped back instead.

The garden and surroundings of the country cottage are perhaps scarcely within my subject, but their importance in contributing to a satisfactory result excuses a brief reference to them. Too much consideration can hardly be given to the question of harmonising a house to its environment. Any paths near the building should be laid out in rectangular lines, and may be paved with red quarries; if there is a fall in the ground, a brick terrace forms a base, as it were, on which the house stands with more dignity than on the general level. Unless the treatment adopted has more scale and solidity than is usual in the cottage

it is important to avoid making much of the accessories, such as walls, gates, &c. A clipped hedge is better than an oak fence, and the latter in its turn to be preferred to a brick wall, particularly if the latter has a cast-iron railing on the top. How often do we see a charming wayside hedgerow ruthlessly destroyed for no reason other than that dictated by the conventional idea that a house must have something "better" than a hedge. A simple utilitarianism is often a safer guide than even cultured conventionality.

## DISINFECTION.\*

## PHYSICAL, CHEMICAL, AND MECHANICAL.

(Continued from page 287.)

By W. NOBLE TWELVETREES.

IT must not be supposed that micro-organisms are altogether undesirable creations. On the contrary, they perform many most useful functions. To one type is attributed the conversion of sugar into alcohol. This, perhaps, may not be universally accepted as useful work, but is counterbalanced by the fact that another variety converts alcohol into vinegar. Microbes also effect the decomposition of animal and vegetable matter, thereby releasing elements for further use in the growth of vegetation. The formation of nitrates and nitric acid in the earth is also due to their action. If it were not for the work of bacteria, the earth's surface would be cumbered with the undecomposed remains of animals and plants, and the soil, deprived of its sources of fertilisation, would become barren and incapable of supporting the inhabitants of the world. The ultimate effect of putrefaction, or decomposition by microbes, is purification, organic matter being resolved into carbonic oxide, hydrogen, ammonia, nitrates, &c. During transition, however, poisonous substances are formed, and if microbes have the opportunity of multiplying in the body disease is produced, not so much by the organisms themselves, as by mechanical irritation, the prevention of nutrition, and by the excretion of toxics into the blood. Millions of tiny, unseen creatures such as these, both harmless and harmful, attend our every

action. They exist in the food we eat, the water we drink, live in our streets, offices, and homes, even in our very flesh and blood, ceaselessly performing the work for which they were created by an intelligence wiser and more far-seeing than our own. In their world are no strikes, no agitations for shorter hours, no movements save those of continuous labour and of uninterrupted overtime. Under such circumstances, it is but natural that injury should in certain cases be caused to animal life. The remedy is to be found in the exclusion and extermination of undesirable types, and in the limitation of their influence. These objects have been greatly facilitated by the microbial examination of air, water, and earth.

## COLLECTING.

Various forms of apparatus are used for collecting and studying the characteristics of microbes in air. The germs are received in a suitable vessel, through which a measured quantity of air is drawn by means of an aspirator or an air pump. Three well-known types of such

apparatus may be mentioned: (a) Pouchet's—collecting on a glass plate smeared with glycerine; (b) Frankland's—collecting in a tube coated with gelatine; (c) Petri's—collecting in a sand filter. Frankland's and Petri's apparatus have facilities for enabling the operator to ascertain if all germs in the air have actually been collected. Frankland's apparatus has two plugs or filters of glass wool, the second of which should contain no germs. Petri's sand filter should contain no germs in the second or lower section. Water and earth of course require no such apparatus for their examination. Next to the process of collection comes cultivation, performed by placing the germs collected in media composed of gelatine, agar-agar, broth, potatoes, &c. The operation is frequently assisted by means of an incubator, which is a water-jacketed box of sheet metal, lagged with felt, having glass doors, water gauge, thermometer, and a thermo-regulator regulating the supply of gas used for heating. The regulator is actuated by the rise and fall of a column of mercury, and a bye-pass is provided

so that the flame need never be entirely extinguished.

#### STERILISING.

All experiments are conducted with the greatest precautions for ensuring the absence of all living germs other than those under immediate examination. All apparatus, water, and media are sterilised before use. The sterilising apparatus employed is practically a model disinfector, and the practice of bacteriologists is, therefore, extremely valuable in determining the efficiency of disinfecting apparatus on a large scale. In sterilisation, hot air at a temperature of about 300 deg. F., and steam at 212 deg. F., are employed. The hot air steriliser is an air-jacketed metal chamber usually heated by gas, provided with thermometers to inner and outer compartments and a thermo-regulator. Koch's steam steriliser is a copper vessel, producing steam from a water-pan by means of gas. The lid is loosely fitting to prevent pressure of steam. The apparatus has gauge-glass and cock, thermometer, and a false wire bottom and inner pan with wire bottom, in which objects are placed for treatment.

#### RESULTS.

The results of experiments show that large numbers of germs exist in the air, the quantities varying according to position. Dr. Fischer found that 120 miles from land, sea air is practically free from germs. Dr. Frankland tested two gallons of air in each of the following positions with the below mentioned results: Norwich Cathedral, 300ft. height, seven organisms; Norwich Cathedral, 180ft. height, nine organisms; Norwich Cathedral, ground level, eighteen organisms; Primrose Hill, top, nine organisms; Primrose Hill, bottom, twenty-four organisms. The number of organisms falling per minute on a dish of one square foot area, gave the following figures at the Natural History Museum: Morning, 30; afternoon, 293; Whit Monday, 1755. The old adage that there is "safety in crowds" seems here to be unmitigably reversed. Germs contained in air are chiefly of the less harmful species. Water, both liquid and solid, almost always contains germs, chiefly bacilli. Unfiltered Thames water has been found to contain 20,000 per cubic centimetre, whilst deep well water is almost sterile. Foods, both liquid and solid, contain microbes in considerable numbers, owing largely to contamination with earth and insects. Speaking generally, microbes require for growth both moisture and warmth. Many kinds die if dried; others are rendered dormant, but revive with moisture. Most varieties prefer alkaline to acid solutions. Light kills pathogenic, but helps the growth of harmless types. The increase of the latter in water has a destructive effect on pathogenic germs. Microbes themselves are destroyed with comparative ease, but their spores have much greater resisting powers. Sterilisation by hot air necessitates the free exposure of spores to a temperature of 284° F. for three hours. Sterilisation by steam at 212° F. is said to be effected in five or ten minutes. Boiling is a fairly effective means of sterilisation.

#### PHYSICAL DISINFECTION.

The earlier types of disinfecting apparatus were used with hot air, and were similar in design to the hot air steriliser already described, except that fire was the usual means of applying heat. The high temperature necessary for sterilisation and the length of time occupied owing to the slow penetrating power of hot air, were great drawbacks to the hot air system. Another serious difficulty was the regulation of temperature so as to avoid scorching on the one hand, and imperfect disinfection on the other. Hot air stoves are now practically obsolete, but between them and steam apparatus a connecting link is supplied by Mason's disinfecting chamber. This is a brick-built chamber having a furnace beneath, generating steam and heating the air. Either dry or moist heat may be used separately or in combination. A damper or louvre is provided with the object of automatically regulating the heat. All air leaving

the chamber is purified by passing through the furnace, which is constructed for consuming the cheapest forms of fuel. The apparatus has been favourably reported on by experts, and is being successfully used in many public institutions in the north of England.

#### STEAM DISINFECTORS.

Disinfection by steam is the most rapid and effective means known, but there is an important difference between the operations of superheated and saturated steam. Experiment has shown that superheated steam at 285° F., acting for twenty-two minutes on spores of bacillus anthracis, had no sterilising effect, whereas the action of saturated steam at 213·80° F. for eight minutes entirely killed a portion of the same cultivation. Saturated steam, when introduced to the interior of a disinfecting chamber, condenses so soon as it meets any objects which are of lower temperature. The steam in condensing becomes a thin layer of water, giving up latent heat, which is absorbed by the objects. More steam then occupies the space left vacant by condensation, and the same operation is repeated until the whole of the objects are raised to the temperature of the steam and penetration is complete. This result is usually arrived at within fifteen minutes, the time depending of course on the thickness of the material to be penetrated. Superheated steam, on the other hand, being a perfect gas, acts simply by conduction, and is even slower in its action than hot air. The only useful manner in which superheated steam may be employed is for drying purposes after disinfection has taken place. If so used, care must be taken to prevent superheating at too early a stage. In modern disinfecting apparatus, saturated steam is applied either under pressure in a confined chamber, or as a continuous current through a chamber having a suitable vent. Machines used with steam under pressure are of two classes, viz., high or low pressure disinfectors. Condensation, as affecting the dryness of goods after disinfection, requires consideration, and is variously dealt with by the use of jacketed chambers and other means.

(To be continued.)

## Surveying and Sanitary Notes.

A START is to be made this summer with the outlet works at the lower end of Loch Katrine. These works include the building of a new masonry dam by means of which the level of the water in Loch Katrine will be raised 5ft. above its present top-water level. This will bring up the storage capacity of the loch to 9849 million gallons, which it is estimated will enable it to yield a supply of 65 million gallons per day. The level of Loch Arklet is also to be raised till it is 25ft. above its present level, and a tunnel will connect it with Loch Katrine. This extra source will increase the supply to the city to 75 million gallons per day.

At a meeting of the Birmingham Tame and Rea District Drainage Board, held on the 15th inst., Mr. J. J. Hughes brought up the report of the Works Committee on the preparation and promotion of the Extension Bill. In proposing that the arrangements mentioned in the report be approved and confirmed, Mr. Hughes said that the Bill had become law, the sum of £400,000 having been inserted as the amount that they would have to spend. In passing the Bill there were some eleven obstacles to overcome. Ten of those were distinctly overcome and settled for the time being. The only matter that remained to be dealt with was Mr. Wakefield's case, which stood for arbitration. As for the settlement with Lord Norton, £25,000 seemed to be a large sum; but they obtained the 118 acres of land to start with, besides the water rights at Forge Mills, and further rights of irrigation,

as to which nothing had appeared. As to the borough of Tamworth, their opposition was a great obstacle, but their requirements were so far satisfied that the opposition from that quarter in the House of Commons was withdrawn. In the House of Lords there was no serious opposition.—Alderman Clayton, as an old member of the board, who knew what was involved in these matters, wished to say, on behalf of his colleagues and himself, that they thoroughly appreciated what had been done by the Works Committee and the officers of the board in bringing this matter to a successful issue. The fact that they had brought themselves at last to face the question of doubling the size of the farm, showed that they had arrived at a time when urgency might fairly be said to be in the ascendant. Now that they had obtained the Act he had no doubt that an equal amount of energy would be shown by the Works Committee in carrying the scheme out. They had had to admit the necessity of the scheme, and the work should be carried out as promptly as possible.—It was agreed that the £400,000 be borrowed from the Corporation for the purposes of the scheme.—The Chairman said that all those who had been associated with him in promoting the Bill must have been more and more impressed with the absolute necessity of going on with the matter without delay. He thought that the Works Committee was the proper body to undertake the work. Three years were allowed in which the land must be purchased, and five years in which the work was to be done, and he believed that they would be able to successfully carry out the scheme within these limits.—It was decided that the Works Committee make the purchases of properties and carry out the works authorised by the Act.

COLONEL JOHN ORD HASTED, R.E., one of the inspectors of the Local Government Board, held an inquiry at the Municipal Offices, Keighley, into an application by the Keighley Town Council for borrowing powers for street improvements and gasworks extensions. The amount asked for in respect of street improvements was £40,000, and Mr. Burr explained that the actual estimate of the cost was £39,591 6s. 10d. The application referred to property in North Street, which was included in a Provisional Order confirmed by Parliament in 1892, authorising the Corporation to widen and improve North Street and Cavendish Street. Of the total amount, £32,212 was for North Street, and the sum embraced properties which had already been purchased. The balance of the sum asked for on account of street improvements, amounting to £7376, was for the making of a road from Bradford Road to Belvoir Terrace in Worth Village, and included also the erection of an iron girder bridge over the river Worth. The application for the gasworks was for the sum of £10,639, in order that two additional lifts might be added to two gasholders. Mr. Burr said that the gasworks were of old date, and had belonged to the town since 1824, and extensions had been made from time to time, borrowing powers having been duly granted by the Local Government Board.

THE supply of water in the Leeds reservoirs at the present time is 1,820·96 million gallons, representing seventy-five days' supply. The storage at the corresponding date last year was 1,956·93 million gallons, or eighty and a-half days' supply. The Waterworks Committee has been in negotiation for the purchase of a piece of ground for the purpose of a new burial ground at Fewston. Two plots were selected as suitable, but both of them were objected to by medical officers, and it was therefore decided that a further effort should be made to find a suitable plot.

THE ancient and Royal castle of Tamworth, the property of the Marquis of Townshend, was recently offered for sale at Tamworth Town Hall. The Town Clerk, on behalf of the Corporation, bid £3000, at which figure the property was declared to be bought by the Corporation.

### Facias and Street Signs.

IN the ante School Board days, when large numbers of the population received no education, and many others made only the most elementary acquaintance of the three R's, it is recorded that a persevering sweep learnt how to read by studying the names of the shopkeepers and their trades and professions, with any other street signs that he happened to pass on his morning rounds in chimney-sweeping. Although we have now had the blessing of universal education for nearly thirty years, it is still possible to find many blunders perpetrated into our street signs, and the before-mentioned sweep must have had a very bad time when he acquired his rudimentary education, for in those days the errors were many and glaring

making assurance doubly sure. Accommodation is also frequently only accorded one *m*. Again, there is very often to be seen on the notice-boards of builders and house decorators (after enumerating the various things the firm can accomplish) the announcement that "experienced workman are sent to all parts." In a well-known thoroughfare leading from Holborn is an announcement of this description. As an instance that even Government departments blunder, it may be mentioned that a little over twenty years since the official stationery department had their carts inscribed "H.M. Stationary Office." The blunder was only allowed to exist for a few days, but not before some wide awake evening newspaper had drawn attention to the "stationary" fact. The floricultural art, too, does not appear to lend itself to correctness in facias, as there is very frequently to be seen on florists' announcements that "bouquets and wreaths" are made to order. As gardeners, as a rule, are somewhat illiterate, this would seem to point to the fact that sign-painters follow their written instructions, as also that invoices from gardening establishments are, at times, fearfully and wonderfully made. In making out invoices and bills the gardener follows what he considers the sound of the names of the plants; in painting sign-boards the Artist or

in, are often more ludicrous than truthful. Again, the haberdashers, or, rather, such few of them as still adhere to the custom of their forefathers, afford much amusement by their suspended goat. Hanging by means of a belly-band at all seasons in such a changeable climate as that of England, and subject to the atmosphere of the metropolis, has not a tendency to cheerfulness, but certainly these suspended goats present more the appearance of drowned sheep than any other animal known to mankind. Then there are the glovers—look what fearful outrages the carvers literally perpetrate at their hands, for certainly was never seen yet a decent, well-shaped hand, gloved or otherwise, suspended from the facia of a glover's establishment, though why we fail to understand, as we should imagine the carving of a good, honest representation of the human hand was not beyond our wood-carvers of the present day. There is still another abomination in carved shop signs, this being the gilded block of wood shaped somewhat after the manner of an isosceles triangle with a rounded base, which is intended to represent a ham—York or Westphalia, as you please. This is one of the worst signs to be seen in the London streets, and we would respectfully suggest that, if it cannot be improved, the ham and

WROUGHT IRON BALUSTRADE. "THE TROCADERO." MANUFACTURED BY MESSRS. JONES AND WILLIS.

indeed. With these, however, it is not our purpose to deal on the present occasion, but rather to touch upon a few of the peculiarities to be found in facias and street signs in the course of a day's ramble through the thoroughfares of the Metropolis; albeit, we must be permitted to remark that it is more than passing strange that sign-writers should be, as a body, such an ill-educated class of men as to be capable of the many blunders which they from time to time commit. We take no count in the following lines of the lavish manner in which commas and other points are distributed in their writing, or of the many unwarrantable liberties which are taken with the possessive case, as a bare enumeration of these errors of commission would occupy far more space than we have at our command. It is not so very long since that he who ran may have read in large letters painted on the side wall of an undertaker's establishment in a northern metropolitan district that funerals were "conducted on the most economic principal." This legend enjoyed the light of day for many years. In a North London coffee-house the public are informed that tea and coffee are "always ready," while the legend on the window of a City coffee-shop instructs passers-by that hot coffee is "ready every morning at five a.m.," which looks much like

writer follows his "copy"—i.e., his written orders. Leaving the mis-spellings, the pranks played by he who gives us bold advertisement are equally strikingly apparent in the carvings. To leave the fearful lions which are found in the Royal Arms, but which have become so common as to cease exciting either notice or ridicule, and who look like fearfully compounded cats, who cannot recall a veterinary establishment where the horse is represented as having a foreleg upraised, presumably intended for an action in trotting, but which really conveys the impression that the animal has been newly shod, and that one of the nails has penetrated the soft portion of the foot, which has been lifted through pain; or that other place, devoted to the sale of lacteal products, where a miserable-looking cow is being milked by an equally unhappy-looking milkmaid. Then there is the Lombardian sign adopted by pawnbrokers, which, commonly known as the three gold balls, are really the arms of the Medici family, and originally represented pills, the founders of the house being apothecaries: hence, when these golden orbs are seen decorated with an encircling ring half-way through, we know that the carver has been allowing his fancy to run free. Signs, again, of public-houses, when carving or pictorial representation is indulged

beef shop proprietors should go one better, and improve it off the face of the earth, leaving to the glaring red in which their establishments are usually painted—why, we wonder, should this be so?—the task of making known the virtues of tasty ham, succulent beef, and toothsome carrots. The three last-mentioned signs are among those which residents in the metropolis certainly could very well dispense with, as they are nothing but the most veritable of artistic eyesores, and in these days serve little, if any, practical use, as all who run now can read—which was not the case in days gone by. The wisdom of our local authorities occasionally comes out in the nomenclature of streets, a notable instance being some years since, if not even now, in the Strand, at Surrey Street, which was so spelt at one end, and Surry at the other, on the principle, we presume, of taking your choice. Only a short time back a road in Clapham caused some discussion, residents of the locality all declaring that it was spelt, *wir*, *wur*, and *wyr*, the name being Wirtemberg. Who shall decide when residents disagree. But none the less someone had blundered. Many other such could be cited. The above are a few of the instances which can be met with every day wherein the sign-writer or carver has

outraged the canons of the English tongue or artistic taste, and the list could be extended to far greater lengths. The samples, however will suffice. As Mr. Herkomer, Mr. Stacy Marks, Sir J. E. Millais, and others have effected a much appreciated reform in the matter of street pictorial advertisement, could not those who have the training of our sign-making wood carvers do something to improve matters in that respect? The sign-writers, we are afraid, are beyond reformation in the matter of mis-spelling, as they are almost sure to follow their own sweet will and way.

#### SHOREDITCH ENTERPRISE.

THE combined scheme of electric lighting and dust destruction which Lord Kelvin inaugurated in Shoreditch on Monday signalises a great advance in municipal house-keeping and in economy of production. The system of using dust as fuel has already been tried, and has proved successful on a small scale. But Shoreditch has adopted a bolder scheme than any yet attempted. Dust and refuse are utilised for generating electric light and for supplying hot water to public baths and laundries, and as on the same site a public library and museum and technical schools are being erected, we have a striking group of buildings which illustrates the progressive movement in Shoreditch. Ten years ago Shoreditch stood for all that was worst in London vestrydom. The only thing upon which the parochial busybodies showed any particular energy was in the consumption of refreshments. But Shoreditch has undergone a marvellous change. Nepotism and pluralism have disappeared, the contractor has been displaced, and a vigorous municipal policy has been pursued. It has given good results in many directions. A notable enterprise was the establishment of a municipal technical school. The centre of the cabinet-making and wood-working industries, Shoreditch was much in need of technical training for its

#### FUTURE ARTIFICERS AND CRAFTSMEN.

But the poor parish had no endowments to support technical education, and it could not levy a rate for the purpose. The Vestry overcame the difficulty by the ingenious device of raising money by letting the street lamp-posts for advertisements. The school soon justified its existence, and will become the nucleus of a much larger and better-equipped institution. When Shoreditch Vestry took the duty of dust removal and cleansing into its own hands it obtained relief from an expensive contract system, but did not solve the problem of economical dust disposal. It has always been a trying thing in great cities to get rid of the daily accumulations of dust, refuse, and garbage. The system of carting or barging the waste away into the country was too expensive to be continued. It was discovered that a cheaper method was its reduction to smoke and clinker by dust destructors. Then it was recognised that the dust crematory involved a shameful waste of heat. As a result, several attempts were made to construct boilers which could use the heat profitably. Schemes were carried out at St. Pancras, Ealing, and elsewhere, but they were not sufficiently matured to ensure absolute confidence in dust as fuel. Shoreditch, after careful investigation, has been able to benefit from all previous experiments, and to establish a

#### UNIQUE UNDERTAKING.

The station which it has constructed is upon the most modern lines. The contents of the household dustbin, street and trade refuse, are carted to the works. Electric lifts and motor-cars distribute the refuse on tipping platforms; mechanical feeders pick it up and charge the cells of the dust destructor. Forced blast is produced by motor-driven fans, and as the works stand near a sewer a fan ventilates the sewer, draws out the gases, passing them into the furnaces, where they feed the flame. A new system of thermal storage which has been introduced economises and stores the heat, as while the dust destructors must be

kept continually at work, an equal production of electric current is not required. The steam generated by the dust destructor passes on to drive the engines and dynamos of the electric lighting station, and the hot water is drawn off as required to the adjoining baths and laundries. All classes in the community are thus served by this system for the utilisation of refuse. The contents of the domestic dustbin returns to the householder in the form of electric light. The vestry is starting wisely by supplying current on a sliding scale which will encourage consumption. The average price may not be more than 4d. per unit. Further, to encourage the popular extension of electric light, penny-in-the-slot meters, with all necessary fittings, will be placed in houses without charge. Free fittings will be supplied in other cases. We may, therefore, look for the popularisation of electricity in Shoreditch.

The current should also be used largely for motive power by the many small manufacturers and cabinet-makers in the district. The whole combined scheme will undoubtedly result in great economies in various directions.

MESSRS. GORDON, LOWTHER, AND GUNTON, Finsbury House, are the Architects to whose designs a public hall and institute are about to be erected at Fordham, Cambs.

At the Kensington Town Hall the case of Peston v. The London County Council came on for arbitration. The claim was made by the trustees under the will of the late Mr. William Peston, the sum claimed being £5753 16s. in respect of the compulsory purchase of the freehold and buildings at 10, Church Court, Kensington. The land was acquired by the London County Council under the Metropolitan Improvement Act of 1894, for the purpose of building a coroner's court and mortuary for Kensington. Since the claim was formulated, the Council had offered the sum of £3400 in settlement. Judgment for £5753 16s. was entered by consent, with costs.

#### THE LOUIS RHEAD POSTERS.

A COLLECTION of some seventy new posters by Mr. Louis Rhead, representing his latest, and certainly most characteristic work in advertisement design, has been on view for some weeks past at St. Bride's Institute, Ludgate Hill. That such an exhibition by a single artist, and one little known as a picture-painter in the ordinary sense, could become an annual affair, and hold its own among the art shows of the London season, would hardly have been credited three years ago. To-day it is one which the student of decoration can least afford to miss. Happily, for the City wayfarer, it is no longer thought unworthy of an Artist of quality to have his signature on the public hoardings as well as on the Royal

Academy walls; and the designing of posters for commercial use may now be looked to as one of the most fruitful fields for experiment in colour and pictorial effect. Already the waste places of our streets have been redeemed from something of their former vulgarity and ugliness by the posters of Dudley Hardy, the Beggarstaff Brothers, J. Hassall, Fred Hyland, and a few others who have been feeling their way towards decorative advertisement, and teaching us the lesson so uncongenial to the English mind—that in order to be original, unique, and impressive, it is not necessary to be hideous, abnormal, or grotesque.

The Art of Louis Rhead, though developed within somewhat narrow conventions, and with a limited set of decorative types, generally fulfils the conditions of a good poster: firstly, that it shall arrest the eye and convey a clear idea of the wares advertised; secondly, that its manner of announcement shall be so pleasing and appropriate as to give a favourable impression of the wares themselves, and invite our interest and patronage. The designs embrace all manner of desirable commodities, from pianos and bicycles to soap, marmalade, and boots. A collection of three score of such posters in the mass is a little confusing to the vision, and each perforce loses something of its quality amid the blaze and glare of its peers; but, at the same time, we are enabled to take a more leisurely and comprehensive view of them in this quiet and well-lighted gallery than we can do in the streets, and thus to gain a better insight into the principles and methods of the poster-painter's art.

The first thing that strikes us in Mr. Louis Rhead's work is his remarkable fertility and ingenuity of design. He can twist a piece of orange peel into a most dainty decorative border for a marmalade label, picturing in the centre a girl with oranges on a balcony looking out towards the sea, and carrying out the colour scheme in rich, cool yellows, admirably set off by the background of blue. Equally ingenious is the poster for "Hop Bitters," in which the light ornamental pattern in white has the effect of being laid over the picture as an afterthought, giving a very quaint and pretty appearance. The female figures are for the most part stately and severe in drawing, sometimes archaic, sometimes classic, sometimes frankly modern, and advertising their wares more often by a contemplative attitude than by declamation or action. To gain this contemplative attitude without affectation is by no means an easy task, but Mr. Rhead achieves it by a wonderful spontaneity and lightness of touch, combined with a dignity and breadth of line which keeps the picture simple and strong, and eliminates everything unessential to the brief and clear statement it is meant to make. These leading figures, which reappear in many guises of race, rank, and costume, have been variously described as Greek,

Italian, and even Japanese in character. It might more justly be said that Louis Rhead's women approximate to an Egyptian type. There is a sort of weird *naïveté*, a mysterious poetry in their look and bearing which is distinctly pleasing, and lends itself remarkably well to the large effects of a poster. Of course we have the pastoral type also—the pink and dimpled milkmaid (whose picture, by the way, has been bought by King Milan of Serbia)—and the characteristic Irish girl whose whisky bottle is very cleverly arranged in a design of shamrock, with trefoil border of the national plant. The symbolic figures for magazine covers, though more conventional, are always graceful and appropriate, and the colour-schemes are thought out with almost unvarying success.

It is indeed as a colourist and a decorator that the artist reveals his individuality and power. One of the most beautiful harmonies in the Exhibition is the "Tobacco" poster, depicting the historic Sir Walter with his pipe, in the costume of the period. Contrary to the artist's custom, the face is slightly shaded, but otherwise the drawing, though bold, is very simple, and three secondary colours suffice for the painting. Only once is a primary colour used in such a quality as to be absolutely painful and violent—namely, in the man's cap in another tobacco poster, where the blue might have been modified without any loss of power. Mr. Rhead is exceedingly happy in his yellows and browns, and some of the most charming of the smaller designs are for printing in two colours only, notably the "Pure Jams" in black and green.

With such a variety of style and subject matter, it is difficult to select any two or three posters as the best in the show. But certainly the "Peacock"—among the smallest and least pretentious of designs—is one of the most perfect decorative devices that the poster-art has yet given us. The conception of a tall, thin girl in yellow, with a green face and black hair and eyes, does not sound at all pretty in words, but the audacity of it is withal so delicate, and the drawing and colouring so ethereal and winsome, that we

are fascinated before we think to criticise. No descriptive formula can give any just idea of the effect which Louis Rhead can get from a few broad lines and three ungraduated colours. In this peacock-girl one is tempted

to call it magic; the lines seem to vibrate under our eyes like strings under a player, and with all its dreaminess the thing is actually alive before us. Eccentric it is, undoubtedly, but it is of that kind of eccentricity that comes with new beauty, and is subservient to it, seeking nothing for itself alone. The merely eccentric may arrest, but it can never satisfy. In the work of Louis Rhead there is always a satisfying element, always something to return to with pleasure as well as to attract at first sight.

The girl with irises, incongruously called "Flower Seeds," is one of the finest pieces of pure decoration in the gallery, but it lacks the arresting qualities necessary for a poster. It would make a delightful screen or panel, with its strong figure dimly seen reaching out among the purple blossoms and long lance leaves. This is an instance of too little action—a charge often brought against Mr. Rhead's feminine types, and not always with reason. What, for example, could be more full of life and action than the bicycle girl at the other end of the room? She is riding straight down upon us at fifteen miles an hour, and we almost move aside to get clear of her front wheel. No wonder that so vigorous an advertisement has been the object of keen competition among purchasers, and it will be interesting to see what enterprising firm of cycle-makers will ultimately put it on the hoardings. It is said that £50 is a price paid for several of the Artist's latest designs.

By the courtesy of Messrs. Hare, we are enabled to reproduce three of this year's posters, which illustrate Mr. Rhead more in his domestic than his classic vein, though the young lady with the cigarettes might, perhaps, resent the classification. Several landscape and seascape designs which reached the Exhibition somewhat late, arriving from abroad, should also be mentioned, especially a "ploughing" subject, singularly rich and striking in colour.

#### THE FIRE-CLAY INDUSTRY.

FOR centuries the manufacture of fire-clay articles has constituted one of the industries of Leeds. The origin and development of the industry are due to the excellence of the fire-clay found in the coal measures along with the seams of coal. The fire-clay is of a special kind suited to the manufacture of fire-bricks for use by engineers for furnaces and other purposes, and also that of gas retorts. It consists of silica and alumina, chiefly in combination as hydrated silicate of alumina, and is remarkably free from the impurities which interfere with the colour and the refractory qualities of clay. The Wortley or Better Bed clay underlies a great part of the east and south of Leeds, and an analysis (inserted in an article by the late Mr. James Holyrod) of this clay, selected for refractory qualities, gave the numbers:—Silica (containing about 0.9 per cent. of titanic acid), 64.93; alumina, 22.54; oxide of iron, 1.61; lime, 0.19; magnesia, 0.02; alkalis, 0.15; combined water with traces of organic matter, 8.28; moisture, 2.28. The products of the industry may be classified as—(1) refractory, (2) sanitary and constructive, (3) decorative. At one time Leeds was famous for its pottery, but this branch of manufacture was allowed to dwindle, and now the decorative is only a minor branch of the Leeds fire-clay industry. It was about the beginning of the present century that the manufacture of fire-bricks was commenced, and sixty years ago this was still the principal article made. The manufacture of coal-gas led to the production of fire-clay retorts and similar articles in large quantities, and afterwards the advance in sanitary science gave new life to the industry. In 1845 the manufacture of sanitary tubes was begun. Since then the methods of producing these and similar articles have been vastly improved. The introduction of a porcelain enamel glaze has greatly furthered the development of sanitary pottery, and by this process it is now possible to produce a variety of articles for which stoneware and earthenware, as generally understood, would be inapplicable. Glazed bricks now constitute one of the chief

products of the Leeds fire-clay industry, and they fetch a higher price in London and elsewhere than any other kind. Besides their use for decorative purposes, the use of vitrified bricks is extending rapidly for the outside surface of buildings in smoky cities, although, curiously enough, in Leeds, where the bricks can be obtained cheaply, such a use is only

beginning to arise. Terra-cotta, a material long known but generally unskillfully used, has had its good qualities exhibited within the last twenty years by most of the leading Architects, and now it forms a very important feature in the Leeds fire-clay trade. It is now extensively used for building purposes. Besides fire-bricks and terra-cotta, there is a special manufacture of porcelain baths which could not, because of their large size, be made in the ordinary earthenware of Staffordshire. The most striking and novel development of the trade, however, was the revival in 1882 of the Faience Art, left to us from the Italian Renaissance of the fifteenth century. The product is not confined to pottery. It is also used for architectural purposes—both for internal and external decoration. Pottery is still made to a certain extent. Unlike most industries of this country, the fire-clay trade has been affected but little by the marvellous mechanical ingenuity which has been one of the leading characteristics of the Queen's reign. Even now, comparatively little machinery is used, and several of the processes in use date back to the most remote periods. Machines have been constructed to supersede the old method of milling by hand, but they have been unsuccessful. It has been found that machine-made fire-bricks have inferior refractory properties. Of course, in some branches machines are now in successful operation. Since the Queen's accession to the throne the fire-clay industry has developed from an insignificant to an important industry. In 1837 there were, roughly speaking, only about 200 hands employed; in 1897 the number has been increased to nearly 3000. Within the last few years the industry has not grown to any very important extent, hostile tariffs having greatly curtailed the export business.

At a cost of nearly £25,000 a block of warehouses is about to be built in High Street, E., according to the designs of Mr. Charles Dunch, Architect, St. Clement's House, Clement's Lane.

PENDING the rebuilding of the South Kensington Museum, the directors will abstain from making further purchases for their various collections. A sum of over £11,000, a grant in aid towards such purposes, appears in the votes of the present year. This and successive grants will presumably be allowed to accumulate to the credit of the Museum.

## In Istria and Dalmatia with a Camera.

(Concluded.)

By W. LAW BROS.

### IV.—SPALATO.

FOR the Artist and archæologist I cannot conceive a keener sensation of delight than that experienced on entering the harbour of Spalato on a fine summer evening, and seeing the long grey walls of the palace of Diocletian gilded by the low western sun, and the wonderful mass of shipping with sails of all hues, and often painted with picturesque designs, as a foreground to complete the picture, and in the far distance the huge mountains of the Dinaric Alps, still with some snow in irregular patches in sheltered spots.

It is dark by the time you have landed, and your first impression of the narrow lanes which have grown up within the four walls of the Roman palace are of huge masses of masonry dimly lighted by a few feeble and flickering gas lamps which yield "no light, but rather darkness visible." But perhaps this gloom gives better than any light the first vague impressions of the colossal remains by which you are surrounded. In Zara and Sebenico

of the inhabitants took refuge within the walls of the palace, which successfully withstood the assaults of the barbarians, and here, inside the palace walls, grew up the present town of Spalato.

A daylight walk reveals the huge masses of Roman masonry, which loomed so huge and shapeless in the dark, as you pass into the peristyle of the palace, now the Grande Place of the town. Here is a perfect front and two wings of Diocletian's work, and marvellous work it is, after sixteen centuries of neglect. But look at the construction. The cornice of the pediment leaps across the central intercolumniation in the form of an arch. You have in fact a building in which the pretence of trabeated construction is abandoned, and in which for the first time the semi-circular arch takes the lead, and the pediment is acknowledged to be a subordinate feature. Look at the wings of the building and see the arches rising directly from the capitals of columns.

The sheds shown in the accompanying illustrations are erected round what was, but alas! is no more, a superb Romanesque tower on a Roman substructure; but its place is now occupied with an enormous scaffolding, within which is slowly rising a nineteenth century

Romanesque tower, spick and span, and the ground inside the sheds is littered about with sculptured stones, some of Diocletian's work, others of later times. The old tower only now remains in old drawings and photographs. Surely some more conservative surgery would have been possible rather than the utter destruction of an old, and the substitution of what we can only call a modern forgery. Surely the nineteenth century should produce nineteenth-century work, and not confine itself to imitations of twelfth or thirteenth century work, long after

DIOCLETIAN'S PALACE, SPALATO.

DIOCLETIAN'S PALACE, SPALATO.

the water power of the rivers has been utilised, and the streets are brilliantly lighted by electricity, but here, at Spalato, you are in an older world, and such new-fangled notions are not to be tolerated. It is best to retire to your hotel and read up your guide-book and prepare plans for the morrow.

The history of Spalato is deeply interesting. Diocletian, the son of slave parents, rose by his energy and capacity to the position of governor to the Roman colony of Salona, and afterwards assumed the imperial purple, making his headquarters in the town which he had governed. On the sea coast, five miles from Salona, he built (A.D. 284-303), perhaps, the grandest habitation ever yet constructed, covering between nine and ten acres, according to English measurement, and to this palace he retired, and here he died in the same year which produced the reversal of his traditional policy of persecuting the Christians and the promulgation of the edict of toleration by Constantine, to be followed a very few years later by the conversion of that Emperor to the new faith.

A very few years after his death, his palace was utilised, in part at all events, as a clothing factory for the Roman troops, and so it probably remained till the disruption of the Roman Empire, and the terrible year 639 saw the invasion of the Avars and the utter destruction of the Roman city of Salona. A few

the spirit of those centuries has departed!

Rather than the horrible restorations, under which name modern Architects have wrought more mischief than has ever been done by Goths and Vandals, Huns and Avars, let us reverently preserve all that can be possibly preserved; and where we must re-build, let it be in work of our own time, without any pretence of a mere copy.

These reflections are forced upon you on entering what is now the Cathedral—a round building, some 45ft. in diameter. Was this the intended tomb of its founder? Its

position and construction seem to indicate this object, and we think that most authorities consider such to be the case, although tradition gives it no other designation than a Temple of Jupiter, and some authorities have looked upon the Temple of Æsculapius, which still stands symmetrically on the opposite side of the peristyle, as possibly the tomb. This is used now as a baptistery. It is a curious example of the irony of fate that, whichever of these two views may be the correct one, the tomb of the great persecutor of the Christian religion should now hold an important position in the offices of that religion, either as Cathedral or Baptistery.

Squeezing your way among scaffold poles and hoardings, which half reveal and half conceal the Roman work, you see a red granite Egyptian sphinx, mounting guard at the entrance of the tomb, Temple or Cathedral; possibly there is, or has been, a second, and the pair may have been brought here in honour of exploits of the Dalmatian troops in Egypt; but while among the ruins one may speculate freely on what might have been, it is, perhaps, wiser to record what is. The interior of the Cathedral is shown in the illus-

REAR OF DIOCLETIAN'S PALACE, SPALATO.

tration. The walls are indeed Roman, but the carvings are modern. The originals are in the museum. The authorities did not consider that these old, weather-worn, and decayed stones, in their original position, would have had far more interest and value than the present substitutes, which are, however, very pretty and probably good servile copies of their predecessors. Three out of the four city gates are still in existence, and show the same Romanesque, rather than Roman design, which I have already noted, and only the limits of space prevent mention showing more evidences of this same development of style. I cannot, however, forbear inserting a view from the roof of the Cathedral, showing the rear of the main entrance of the Palace, and the huge arches turned with tiles, and the bonding courses of the same material, together with the buildings which the degenerate successors of the Romans have thought fit to erect against them.

Before leaving, you should pay a hurried visit to the howling wilderness which once formed the flourishing city of Salona. Of its former magnificence you can form an opinion only from the scattered remains of its amphitheatre and its baths, its Temples, basilicas and aqueduct, all of which scattered remains are strewn about. Some small amount of excavation has been carried out, but the Austrian Government is not wealthy, and troops and ironclads are required more urgently than mere archaeology, and such things receive scant attention.

I have selected from my photographs two which show, first a necropolis, where the stone sarcophagi are literally to be found by the hundred, some entire, some broken, some with covers, and some without, of all sizes and dates. Many bear early Christian emblems, which show that faith to have been strongly held here. Some few, with very elaborate designs, have been removed to the museum at Spalato, but many more remain here neglected and deserted, amid rank grass and weeds, with which Nature is kindly labouring, slowly but certainly, to efface all traces of the ravages of man.

Another view is of the remains of a Christian basilica. Its rows of stately columns show what a superb building it must have been in its time of prosperity, but now few ruins are more hopelessly deserted and forlorn. It is hard to form a guess at its date even. Diocletian would never have allowed the Christians to erect a basilica in his time, and in his favourite town of Salona, and the sect must have become very wealthy and powerful to have built on such a scale. On the other hand, the town was utterly destroyed in 639, consequently these ruins cannot be later, and are probably not much earlier, than this date.

Hard by the ruins is a small albergo, the vine-covered porch of which is supported by a Roman column, its base in the air, on the right hand, and on the left by two Roman fragments with superb composite capitals—one reversed forms a base, while the other retains its proper position. Above is a magnificent head of Medusa. Over the other door, beside the sign of the Austrian tobacco regie, is the bust of an Emperor, and above, a portion of a richly carved column surmounted by other busts. Further examination reveals inscriptions, altars, fragments of cornices and capitals, which tell a tale of the wealth of materials at hand when this little wine-shop was erected. It is perhaps a fitting picture to conclude this series of Dalmatian sketches.

Thousands of Englishmen visit every year the cities of Italy. How few of them seek the opposite coast of the Adriatic! And yet, perhaps, those who have read these rough notes and seen the photographs will agree with me that there are few coasts in Europe which should have more attractions to the lover of Arts, History, or Literature, than that of Dalmatia.

The foundation-stone of a new chancel and vestry, costing £800, to Stockingford Church, near Nuneaton, has been laid.

## NOTES ON CONCRETE & CEMENTS.\*

(Continued from page 300.)

By JOHN JAMES HENDERSON, DUNDEE.

IN street pavements and railway platforms concrete has found a more general adaptation than in almost any other direction. It is

REPUTED TOMB OF DIOCLETIAN. NOW THE CATHEDRAL, SPALATO.

often laid *in situ*, but sometimes as slabs. The Victoria Stone Company and Imperial Stone Company of London manufacture slabs which are found more convenient in London as having to be frequently lifted and relaid; while the Granolithic is more frequently manufactured in its place in alternate sections. Messrs. Doulton have recently put on the market a tile shaped like the letter L, for use in building transformer chambers or manholes in streets, with a backing of concrete, of which the tiles form the lagging. All these various examples of the use of concrete have one common feature in that they are designed, more or less, to resemble the stone or concrete formed in the great laboratory of Nature, the mechanically formed arenaceous stones less or more closely compacted according to the size of the grains, the proportion of cementitious matter, and the pressure to which they have been subjected. This pressure is one of the main causes why the lower beds of a quarry are stronger than those above, and the more nearly we can imitate Nature in the quality, method, and manner of our composition of concrete, the greater success will attend our efforts. There

\* A paper read before the Edinburgh Architectural Society.

is an example of the use of concrete in the railway bridge over the Dochart on the line from Killin Junction to Loch Tay, built about nine years ago; five arches are constructed, but so little care has been exercised that the marks of the lagging boards are easily discerned. Each arch was thrown in one day, and centring was used as in an ordinary arch. An attempt has been made to give it a monumental expression by a battlemented cornice, but its failure is conspicuous by the rough surface of the wooden moulds showing on the concrete blocks and the corners and mouldings chipping off. These roughnesses afford foothold for vegetable germs which may eventually bring about disintegration. There are upwards of 200 blocks in this cornice, and five different moulds would be required, so that a very little extra outlay for brass moulds, or for lining the wooden ones with zinc, would have greatly enhanced the monumental appearance and vastly increased the durability. Four years ago a bridge was built over the Danube, where the centring boards were covered with strong packing paper well soaked in linseed oil and with planed wedge fillets nailed on the soffit to give the appearance of ashlar courses on soffit, and the face boards planed and foiled and fitted with similar fillets to imitate voussoirs. Examining the structure of stones under the microscope is an interesting study, and you may draw a comparison between one loosely put together, though regular in formation, such as the housemaid would use for polishing the hearthstone or doorstep, and others equally regular but more closely compressed, and therefore suitable for use in buildings of longer or shorter endurance. In these two points of compression and reduction of aggregate, considerable progress has been made. In the first specimens of Victoria stone laid down in Westminster some twenty years ago, large-sized stones were allowed to be used, with the natural result that the more

easily abraded portions wore away quickly, leaving the harder nuggets protruding, much to the discomfort of the pedestrian. This is now almost wholly cured by the use of aggregate not much larger than hemp seed, making the artificial slabs far superior to the best natural stone flagging, as even then it is not always possible to obtain equally hard material. All these slabs and pipes are made, as I have already said, under compression, sometimes applied by a hammer or beaten in the hands

NECROPOLIS, SALONA.

of the moulder, in other instances by mechanical power. In the case of the Imperial stone there is also a trembling motion imparted to the frame in which the slabs are made so as to

consolidate the materials, attaining the same end by shaking as was attained in the case of the Welsh dam by hand-placing and beating—that is, to make the pieces of aggregate jam themselves together in the smallest possible space. It is not now so finical or unnecessary as it seemed a few years ago to be specially careful over the choice of an aggregate suitable for the intended work. Sand plays the most important part, and, according as it is selected from the bed of a river or from the geological deposits in land pits, the resultant strength of the concrete will be less or more.

RUINS OF BASILICA, SALONA.

Pit sand is preferred by some because it possesses greater angularity of surface than that which has been subjected to the rounding action of the current of a stream. From recent experiments it is ascertained that with fine sand more cement is required than with coarse sand to obtain the same quality of mortar, because within certain limits the coarser sand gives smaller interstices requiring to be filled with cement. Monsieur Feret, the Director of the Laboratory of Roads and Bridges at Paris, in 1893 demonstrated that for any large and important undertaking the architect or engineer should specially investigate the

#### QUALITY OF THE SAND

at his disposal, so as to ensure the most economical proportions; and, further, that the proportions should be settled by the relative weight of the materials instead of by the measure. Some of the artificial stone companies prepare their own sand by selecting the stone and crushing it to the requisite size. The question of cost, either of crushing or carriage, may sometimes prevent the Architect or engineer selecting the very best sand, but I venture to claim and assert that no question or objection whatever should prevent him insisting on the sand and all other aggregate being thoroughly washed. It is scarcely within the bounds of possibility to obtain a sand so clean as that on being washed it will not throw off some clay or loamy sediment. Take a sample of any sand from a builder's yard and put it among water, stirring it up so as to test its impurity. The Victoria Stone Company wash the crushed granite in a Matthews washing machine, expressly to remove the dust generated in the process of crushing, because this dust, though partaking of the nature of stone, is non-adhesive, and prevents the adhesion of the cement to the stone. It is worthy of notice that every stone entering into the composition of the Welsh monolithic dam has been washed from a hosepipe under a pressure of 140 feet, while the rock crushed into sand and gravel was also subjected to the same thorough scrubbing. If you even take a sample of sand obtained by crushing stoneware pipes or fireclay retorts and put it in water, you will demonstrate for yourselves

the necessity of washing even such a material after crushing. Messrs. Robinson, who manufacture a cement from alabaster, say in their circular that, unless the user is prepared to thoroughly wash the sand, they would prefer that he should not use their cement. Next in order comes gravel. If it is small (say about the size of pigeons' eggs), it will in ordinary cases be used as it comes to hand, and this may give fairly satisfactory results where one can be confident that no strain will come upon the work other than a direct downward thrust or compression.

But one can never be positively certain that a compressive strain may not occasionally be changed into one of tension or torsion, and in such circumstances the smooth surfaces of the pebbles offer no grip for the cement. Some years ago there was a failure in the walls of the dock at Arbroath, and part of the concrete foundation was taken out. I had an opportunity of inspecting some of the blocks as they lay on the quay, and in these blocks the pebbles stood out like knuckles, leaving on the other blocks the corresponding matrices or moulds, clearly showing that the strength of the block was not aided or

increased by the presence of the gravel, and exemplifying at the same time the incorrect idea of a matrix and the insufficient homogeneity of the mass. If the gravel is large and crushed by a stone crusher, it then forms an aggregate of great value because of the angular points and roughened surfaces which it presents. Then stones or quarry refuse are good aggregates, and according to the quality of the stone so will be the strength of the work. Granite mixed with a due proportion of other kinds of a less smooth texture will give the best results in pavements or railway platforms. Probably from the want of mixture, along with rot being open to the cleansing action of the rain, the covered-in platforms of railway stations are sometimes dangerously slippery, fine sand has to be sprinkled over them. From some experiments of my own, made a few years ago preparatory to laying the platform of a bridge, I formed the conclusion that, for breaking strain and tensile strain, limestone is superior to granite as an aggregate. In both the stone and the cement broke equally across, but the granite showed a more glassy-like fracture. Then, as a means of

#### UTILISING WASTE PRODUCTS,

broken pottery and disused gas retorts form one of the very best aggregates, particularly in the construction of fireproof work, as this aggregate, having been tested as by fire, is

really fireproof. Some so-called fireproof work would miserably fail if put to the test, because its component materials have not been passed through the trial by fire previous to use. Another waste product which has long been an eyesore and a nuisance is the slag refuse from ironworks, but it is now being largely used as an aggregate. Messrs. Jones, of Middlesbrough, compound both slabs and bricks with cement and slag. In Dundee we have several examples of stone balustrade cornices being repaired with fireclay balusters; but you are well aware that such articles in fireclay cannot always be obtained of exactly one height and without any twisting, whereas, if such articles were made of concrete, of cement, and any waste product in iron or brass moulds and under pressure, absolute exactness of shape and dimension would be obtained. See specimen of pipe for smoothness. Before leaving this part of the subject I would like to urge on the younger members especially to be extremely careful with the

#### SPECIFICATION OF CONCRETE,

to see that the right proportions are specified, and to see that the contractor complies with the conditions; as, for example, you may specify cement, sand, and broken stone in certain proportions, and he may think he is doing you a good turn by putting in some gravel among the sand, whereas he is frustrating your good intentions. It is even more important still to steer clear of voids or air spaces in concrete, and a very practical way of solving this is to fill a measure with the broken stone you are using, shake it well down, and fill up the measure with water. The quantity of water will represent the quantity of sand and cement required. Repeat the experiment in the same way with the sand, and the resultant quantity of water will be the quantity of cement required. Four-fifths at least of all the concrete work of the present day is compounded with Portland cement for the matrix. The word matrix may have obtained its general use from the idea of the stones or aggregate being placed in the soft cement mortar as in a mould or matrix; but this idea comes very far short of conveying to the mind the true purpose, which is to form a homogeneous monolithic mass, in which the lime or cement performs the function of a binding or cementing agent, causing the particles of the aggregate to adhere firmly to each other. Sometimes other cements are

A WAYSIDE INN, SALONA.

used, such as Medina and Roman; they are much quicker setting, and therefore more suitable for jointing ashlar in tidal work, but not so suitable for ordinary concreting. Occasionally ordinary lime or hydraulic lime is used, but, on a comparison of strength in its ratio to bulk, Portland is by far the most convenient and economical. It was first made

by Aspdin in 1824, and so named by him from its resemblance to Portland stone. Chalk and clay are the component parts. From 70 to 80 per cent. of the chalk and 20 to 30 per cent. of the clay are mixed with a quantity of water into a thick paste or slurry, as it is called by the workmen, run into tanks, allowed to settle, the surplus water run off, then the paste is taken out and dried either in air or by help of steam. When sufficiently dried it is burned in kilns at a high temperature, after the manner of burning limestone. After being sufficiently calcined it becomes clinker, and when withdrawn from the kiln is allowed to cool, ground to an almost impalpable powder, packed in casks or bags, and put on the market. Within the lines of this brief description there is room for a most extended lecture, which would be more useful to manufacturers than to the present company. Yet a few remarks are due to the importance of the cement which enters so largely into the composition of all concrete.

## CEMENTS.

As is well known, there is *good* concrete and *bad* concrete. In the case of bad concrete 60 per cent. are caused by bad cement, 25 by bad aggregates, and 15 by bad manipulation. It is therefore important to know when the cement is good, and how to prove its goodness. When too much clay is used in the compound, a light-weight cement is produced, rather quick setting, and liable to crumble on exposure. When too little clay (equivalent to an overdose of lime) is found in the mixture, it will stand a high degree of temperature in calcining, but the resulting cement will be liable to blow, blister, or swell in the work from the air slaking of particles of lime. The basis of cement is carbonate of lime, and the best samples from 74 to 77 per cent. of this chemical. Formerly the intimate mixture of the components was effected by the aid of a very large quantity of water, which had to be all dried off again, but now the mixture is effected by grinding with a very small quantity of water, from 35 to 40 per cent. of the whole mass or twenty-two to twenty-four parts of water added to every 100 parts of the dry materials, thus shortening the drying process, and improving the intimate incorporation of the two materials. In some of the German manufactories the chalk and clay are ground and washed separately before calcining, so as the more readily to ensure the mathematical adjustment of their proportions and the separation of any foreign deleterious substances. In the burning, the portion at the bottom is apt to be overburnt and that at the top insufficiently burned, and in the best manufactories these are separated on their removal from the kiln. The grinding of the clinker is the next important step, the fact having been clearly demonstrated by repeated experiments that the finer the cement is ground the greater its strength, and the greater the quantity of sand which it will carry. From very few manufactories is the cement now sent out without being sifted and the residue or coarse particles put again through the grinding mill. Before being used, the cement must be cooled down by spreading out over a wooden floor to air, slake the coarser particles, and prevent its too quickly setting. A very moderate specification for cement is that it should weigh not less than 108 lb. per bushel and not more than 116 lb.; that it be of such fineness as wholly to pass through a sieve of 2500 meshes to the square inch; that not more than 10 per cent. of residue should remain in a sieve of 3600 meshes to the square inch; and that briquettes of neat cement after immersion in water for seven days should bear a tensile strain of at least 360 lb. per square inch; but too often a good cement is killed by dirty sand or bad aggregate. Consequently a desire sprung up to have a nearer approximation to the actual facts by mixing certain proportions of sand in the cement briquettes—usually one to three; but the sand had to be reduced to a standard, so that part is taken which passes through a sieve of 400 meshes to the square inch, but does not pass through the 900. This testing with sand has been in use in Germany for many years, but more recently adopted

in Britain. The German manufacturers use one particular sand for testing. It is not possible for the same to be done here in every case; but with care in choosing a sand which shows under the microscope that it is of an angular formation and not rounded, and which a chemical examination shows to be free of any deleterious chemical compound, a tensile strain of 250 lb. to the square inch should be obtained. Anything less should not be accepted. From this 250 at seven days the strength should increase very rapidly up to twenty-eight days, and then more slowly, so that in any large undertaking briquettes should be made in sufficient number to have two tests at each period of one, two, three, and four weeks. In 1894 Messrs. Dyckerhoff published the result of their experiments, to the effect that a cement which would leave a residue of 10 per cent. on a 2500 mesh would show a tensile strength of 42 per cent. greater than the same cement from which the coarser particles had been removed by a 32,200 mesh, but that the latter—that is, the finer cement—when mixed with standard sand three to one would show 41 per cent. greater than the coarse cement (these all at seven days), and 64 in the case of one of cement to five of sand at the end of twenty-five weeks. This result has recently been confirmed by a severe storm which arose between the majority of cement manufacturers of London and one firm who thought to improve their cement by the addition of ground ragstone. It is about two years since this happened, and last November Mr Butler gave to the Society of Engineers the results of a long series of experiments showing that the extremely fine particles of neat cement by themselves are not so strong as a cement containing coarser particles of clinker, which form, so to speak, a perfect aggregate and nucleus of crystallisation, and the presence of small particles of inert material afford more nuclei of crystallisation and thus enable the briquettes under test to show a higher tensile power; but when standard sand is added to the briquettes then a lower tensile strength results, which might be expected, because, if two particles of sand or aggregate have between them a particle of an inert substance instead of an active cementitious particle of cement, the weakening of the mass must result. Dr. Michaelis, of Berlin, in his report to the London Chamber of Commerce brought out the same results. At the risk of repeating myself, I ask you to notice that the same argument holds good for the washing of all sand and aggregate just before use, because the crushing of the stone and the abrasion of the sand causes the formation of dust which is not cementitious and which envelops the particles of sand or aggregate and so prevents the active cementing agent binding the particles together. Having therefore attained some excellence in the manufacture of cement, let us turn our attention to securing good sand and good aggregate, not merely in slabs, bricks, pipes, or other articles made in the workshop, but in the ordinary work of foundations, street pavements, and house walls. Why should we think to save some cost on the price of the cement when we have to pay carriage of the coarser particles from London to Edinburgh which could be got more cheaply nearer home? And how annoying it is to see good cement killed by the carelessness of workmen making up the cement on the street or on the clay ground, allowing chips of wood, or straw, or reeds which have been brought in with the sand, or any other ingredient, quite promiscuous like to be incorporated with the cement. One difficulty which prevents progress being made quickly is the want of a national museum or public gallery for testing various samples at various ages. Of course the manufacturers preserve their own records, but these are not accessible to the student, and cannot be compared one with another. Perhaps in this Jubilee year some beginning in this direction might be made by one of the learned societies or by one of the rich municipalities of the empire. I would like to raise my voice in warning against that phrase so often seen in flaring advertisements: "No skilled labour required." That phrase has wrought more

mischievous than can be calculated. There is no work, however humble or simple it may look, but requires skill, and the proper mixing of concrete requires skill of no ordinary kind.

## WEST RIDING COUNTY BUILDINGS.

THE West Riding County Council has applied to the Local Government Board for leave to borrow about £125,000. Of this amount it is proposed to spend upwards of £80,850 on the building of a new hospital for the treatment of acute cases of insanity—the new building to be on land adjoining the existing West Riding Asylum at Wakefield—and £43,500 on the completion, fitting-up, and furnishing of the new County Council Offices at Wakefield. To secure evidence in connection with the application to the Local Government Board to borrow this sum of money, Colonel John Ord Hasted, R.E., visited Wakefield a few days ago. The Inspector considered the case of the proposed loan of £43,500 for the fitting, furnishing, and completion of the new County Council Offices. In the Architect's original estimate, including land, quantities, fees, &c., the cost of the building, it was stated, was set down at £68,424. In this the sum of £63,974 represented the building proper. The lowest tender, however, that was received for the carrying out of the original design was as high as £80,384, or £16,410 in excess of the Architects' estimate. The General Purposes Committee that had the matter under consideration endeavoured to secure such alterations in the premises as to bring the tender within the estimate, but eventually it recommended to the Council the acceptance of the original tender of £80,384, subject to the omission of certain items for electric light, and in respect of caretaker's house, amounting to £3560. Messrs. Armitage and Hodgson's tender to the amount of £76,824 was then accepted. Since the tender was accepted several additions have from time to time been made—the principal items being for raising the ceiling of the council chamber, the instalment of electric wire, inter-telephonic communication, stone carving, fibrous plaster, heightening of the tower, accommodation for boiler, and other additions, resulting in increasing the original estimate of £76,824 to £108,543. A loan of £60,000 having already been approved by the Local Government Board, the object of the inquiry was for leave to borrow £43,500 more.—The Inspector, after hearing the case in support of the County Council, observed that £12,500 seemed to be for furniture, and that it was not usual to allow so long a period as thirty years for the repayment of loans under that head.—It was stated in reply that the fittings and furniture would be of as permanent a character as the building, and it was proposed to ask for a period of thirty years in regard to the whole of the loan.—The Inspector: Much of the expenditure seems to have been caused by excess of ornamentation and decoration.—Mr. Hankinson: And by the heightening of the tower, of the Council Chamber, boiler rooms, for which land had to be purchased, and other important alterations.—The case of the application for the power to borrow £80,850 for asylum purposes was separately dealt with. This application, it was stated, was to borrow £80,850 on account of the erection of the new acute asylum, £2520 being for the purchase of additional land adjoining the existing asylum estate at Wakefield. The amount of the contracts already let represented about £69,000. Other works not yet contracted for were estimated to cost £11,617. These would be let presently, and there was an amount allowed for contingencies amounting to £298, making a total of £80,860. Mr. Vickers Edwards, county surveyor, having produced the plans in connection with the building, the inquiry closed with an intimation that a further application would be made in regard to the cost of fitting and furnishing the building.

It is intended to erect a new Church at Pentre, near Flint, on a site given by Mr. J. K. Huntly, of Highfield Hall.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
June 30th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THERE is a proverb that "any stick is good enough to beat a dog," and it would appear, judging from the numerous flimsy pretexts which are put forward for the purpose of collecting subscriptions, that any excuse is good enough for the purpose of restoring a Church. The rector and churchwardens of Whitchurch, otherwise Little Stanmore, near Edgware, are appealing for funds for repairing the Church and providing a new organ chamber to the Parish Church, on the ground that the organ is that upon which the immortal Handel during the years 1718-21 habitually played. The musical critic of the Daily News (who is likely to be an authority on the subject) asserts that the present Whitchurch organ cannot possibly be Handel's, and that Handel has been shown, on the authority of Mr. W. H. Cummings, not to have visited Canons (the Duke of Chandos's seat) until he went there in 1720 to produce his oratorio of "Esther." The organ at Canons upon which Handel played, he being organist to the Duke of Chandos, is now at Gosport, having been purchased in 1714, when, on the death of the Duke, the house at Canons was pulled down. The case of the organ at Whitchurch is ascribed to Grinling Gibbons. The placing of organs in chambers in small Churches is generally condemned by musicians, and the addition of an organ chamber to an ancient building is to be deprecated, as it destroys the authentic character of the plan, and generally results in the obliteration of some interesting feature and the introduction of unnecessary new work. In the case of a Norman village Church, the addition of an organ chamber is sufficient in many cases to disfigure it past recognition, and an example of the mischievous effect of such an addition may be seen at the pretty Church of Kingsbury, near Hendon, Middlesex. Whitchurch Church appears to have been rebuilt at the beginning of the last century.

MR. WYKE BAYLISS, the President of the Royal Society of British Artists, who has received one of the Jubilee honours, has waited somewhat long for recognition in his position as President of the R.B.A.'s. There is probably no Artist in London who has given more generous encouragement to young painters than Mr. Bayliss. He is always discovering new talent, and the doors of the Suffolk Street Galleries are ever open to admit it. As a painter, Mr. Bayliss is a one-subject man; he never wearies of the beauty of Church interiors, and there are few Cathedrals, either British or foreign, which he has not painted; and in all his pictures he gets a spirit of reverence and devotion which immediately stamps the work as coming from his hand.

At the third conference of the Clergy and Artists' Association held in the Jerusalem Chamber, Westminster, Canon Gore, in his opening address, remarked that a proposal to start a new association for any purpose under the sun aroused an instinctive antagonism in the human heart at the end of the nineteenth

century. For there were already so many societies. The question was whether there was any adequate justification for this Clergy and Artists' Association, and for maintaining and developing it. If they went about the country and went into many Churches, they would see that the period was one of Church restoration, and the restoration was of a very decent order. But they must see a great deal of Church decoration which caused them to ask the question, "How much a yard was it?" and to make no other inquiry. There was the least possible of the individuality of the Artist about it, for when people wanted to have a Church decorated there were places to which they could go and find out the cost, and the transaction was business-like. Anything else was indefinite, and it was thought that only great institutions like St. Paul's could employ an Artist directly to exercise his personal skill and power. It was because they were dissatisfied with this state of things that this Association had come into existence. Its object was to bring together those who had the material for ecclesiastical decoration, and those who had the personal gifts.—A paper was read by Mr. Edward E. Prior, on "Church Building Present and Future."

Now that the patents have been secured, Mr. W. H. Preece has given us particulars of Marconi's wireless telegraph. It is based on the principle of sending waves through the luminiferous ether by means of electric sparks. The sparking takes place between metal balls which are connected to an induction coil, after a method devised by Professor Righi, following the classical experiments of Heinrich Herz. The electric waves set up in the ether by the spark as ripples are produced by dropping a stone into a pond, travel with the speed of light, and can be reflected or projected in the manner of light.

THE Dean of St. Paul's writes:—"St. Paul's has been so much in evidence during the last few days that I am anxious to bring the following under the notice of your readers. Through the liberality of four City companies the half domes at the corners of the great dome will be filled with mosaics, we hope before the end of the year. This and other work that is in progress will exhaust the funds at our disposal. We are very anxious to carry on what has been so well begun whilst we can have the invaluable help of Mr. Richmond. There are two things which press. The one is the space between the whispering gallery and the bottom of the windows in the dome. To cover this with mosaics will cost not less than £10,000. The other is to decorate the roof of the aisles of the choir, where there are six small shallow domes, with a place for the arms of any donor who would kindly give £1000 for the completion of one of them. We are anxious to make arrangements with Mr. Richmond, so that there may be no stoppage in the work. The money will not be wanted until next year, so that a promise to be fulfilled next year would suffice; but, as we cannot venture to proceed without the certainty of knowing whence the requisite funds are to come, I lay this before your readers in the hope that some of them may be moved to help us to proceed with this most desirable work, in which case I would ask them to communicate their intention to me."

MR. ALEXANDER R. BINNIE, Engineer of the London County Council, who has received the honour of knighthood, was pupil and assistant to the late Mr. J. F. Bateman. In early life he was engaged on railway construction in England and Wales, and he entered the Public Works Department of India in 1868. After distinguished services there, he became engineer to the Bradford Corporation, and during his period of service there he laid out and designed a very large extension of the waterworks. His lectures on Waterworks Construction have been published by the Government. Mr. John Wolfe Barry, C.B., F.R.S., President of the Institute of Civil Engineers, whose name was also amongst those receiving the honour of knighthood, is the youngest son of

the late Sir Charles Barry, R.A., and was born in 1836; educated at Trinity College, Glenalmond, and King's College, London. He represented Great Britain on the International Technical Commission on the Suez Canal, and was engineer of the Tower Bridge, 1894, of the Barry Docks, and other important engineering works.

MESSRS. MAPPIN AND WEBB have on view at their Oxford Street house the gold casket which was presented to the Queen on the occasion of her recent visit to Sheffield. The casket, which Messrs. Mappin and Webb designed and manufactured, is a beautiful example of the goldsmith's art. In general form it is oblong, conceived with distinct regard to the style of the Sheffield Town Hall, of the opening of which it is to be a record. The base is about 14in. by 10in., and the casket rising on this has five panels on the obverse and five on the reverse, while the ends bear, one the arms, crest, and motto of Her Majesty, and the other the arms, crest, and motto of the City of Sheffield. The lid is a rich, bold, oblong dome, with a figure of Britannia standing in the centre, the Trident in one hand and the Union Shield in the other. At each corner of the casket, but standing well out from it, are four statuettes representing the four divisions of the globe to which Sheffield trade penetrates. These are the main features of the design; but its details are also full of interest. The panels of the body of the casket, for example, are very beautiful, being largely emblematic of the industry of Sheffield, and the elaboration of the lid is also most effective. The gold key, likewise, is in harmony with the style of the Town Hall in its column and embellishments, and the whole work is certainly a very worthy memento of the act which Her Majesty performed a month ago.

THE total expenditure upon the restoration of the west front of Rochester Cathedral, and upon other works connected therewith, has been £7358. Besides this, between £600 and £700 has been spent in restoring the crypt, which is one of the finest in England. The old Norman work has been preserved, and the southernmost aisle has been partitioned off into a series of vestries. Of the amount last named, £500 was contributed by the Dean as the result of his lecturing tour in the United States. It is now proposed to launch a scheme of restoration by the side of which the previous works will be dwarfed into insignificance. It is desired to restore two of the roofs, which were spoilt by being lowered in times gone by, and to build a new tower and spire in place of "the present deformity," as the Dean terms the existing tower. The estimated cost is £20,000.

JOHN GIBSON, R.A., who was a native of Conway, but a large portion of whose career in Art was passed in Liverpool, was the sculptor of the marble statue which marks the tomb of William Huskisson in St. James's Cemetery, and a bronze replica of the effigy holds a place in front of the Revenue Buildings, facing South Castle Street. Perhaps the authorities may feel inclined to direct the cleaning of this fine work as well.

MR. A. G. TEMPLE, Director of the Guildhall Gallery, is preparing for Messrs. Chapman and Hall a work on "The Art of Painting in the Queen's Reign." The sub-title, "A Glance at some of the Painters and Paintings of the Period," explains the plan which the author has set before him, to give a *résumé* of the progress of British painting in the last sixty years. Biographical details of the Artists are not more freely given than is necessary, attention being directed to their works. Representative examples of the leading painters are reproduced—many for the first time—to the number of sixty or seventy. Among them are Landseer's "Monarch of the Glen," David Cox's "Vale of Clwyd," Millais' "Ferdinand and Ariel," "Chill October," and "Fringe of the Moor," Holman Hunt's "Light of the World" and "Christians and Druids," and others by Stanfield, Mulready, Turner, Watts, Frith, Hook, Noel Paton, Madox Brown, Rossetti, and Leighton.

UNIVERSITY OF ILLINOIS

We are able now to say definitely what Lord Onslow proposes with regard to the Works Department of the London County Council. It is that "as the Council is divided on the question of continuing the Works Department," the report of Sir Arthur Arnold's Special Committee should not be proceeded with; but that the General Purposes Committee should be directed to report as to the best means of carrying on the work "with as little loss as possible" until after the election in March next. The meaning of this ingenious resolution is to kill the Works Department and the policy of direct employment, without incurring the odium of killing them. Apparently Lord Onslow wants to leave the Progressives saddled with the blame of all the apparent "losses" which his own policy has produced, and to avoid the responsibility of any constructive proposal. Sir Arthur Arnold's Inquiry was Lord Onslow's own creation. It has made a report, the main effect of which is wholly favourable to the Progressives. To ignore this important verdict is an insult to the Special Committee, and is a continuance for party purposes of a disastrous state of uncertainty.

WITH reference to the proposal to re-build Gowthwaite Hall, Bradford, Mr. Thackeray Turner, Secretary of the Society for the Protection of Ancient Buildings, writes:—"I am afraid the old building materials of Gowthwaite Hall, if erected on another site, even in strict conformity with the original plans, would altogether fail to appeal to our feelings in the way the present house does. Besides the loss of that identity of locality which in so inexplicable a way affects our minds, and the sacrifice of great portions of the original materials which could never be re-used, we must take into account the effect which the selection and arrangement of materials have on our sense of propriety. Thus, in a house erected when oak was plentiful, but the labour of working it great, we see no incongruity in a rudely axe-fashioned beam of enormous strength being employed to support a very small weight, although a similar arrangement in a modern erection would grossly offend our sense of proportion and beauty. Without venturing too far on the debatable question how far these and other reasons may account for the fact, I can unhesitatingly state that an ancient building, thus re-erected, possesses scarcely more interest than an Architectural plan. It is therefore for Yorkshiremen to decide whether Gowthwaite Hall shall remain intact on its present site, with all its historic and artistic interest on its head, or whether all but a fraction of its associations shall be lost to posterity. No middle course is possible."

THE members of the Yorkshire Archaeological Society recently visited Markenfield Hall and Ripon Minster. At Markenfield Hall the ancient banquet hall was first inspected. This, with one or two unimportant alterations, stands precisely as it did at the beginning of the fourteenth century. Indeed, Markenfield Hall is the finest example of a thirteenth or fourteenth century manor house in the northern counties. In the hall the hon. secretary, Mr. William Brown, of Trenholme, Northallerton, gave a brief and interesting sketch of Markenfield Hall and its owners. The earliest mention of the house appears to have been in Domesday Book. Not until early in the thirteenth century did it come into possession of the Markenfield family. In 1316 the then owner and founder of the family fortified it, digging around it the moat which still remains. The ancient chapel and the solar (or Lord's retiring room) were visited. The old buttery in the basement, which remains just the same as in 1300, was also worth a visit. During the stay at the Hall, Mr. C. C. Hodges, of Hexham, described the Architectural features of the building. Ripon Minster was next visited, the society being received by the Dean (the Hon. W. H. Fremantle), who gave an interesting sketch of the building. Mr. Hodges described its Architectural features, and the visitors then explored the Minster, inspected the mural tablets and effigies, the carving of the stalls of

the Canons, and admired the beautiful east and west windows. The Anglo-Saxon crypt, sole relic of the Church built by St. Wilfrid, was inspected, being lit for the nonce by candles, that the narrow steps, worn by the feet of countless penitents, might not be responsible for any accidents. The Norman crypt, constructed with the main body of the Church, by Roger, the great building Archbishop of York (1154-1181), was likewise visited. A move was made to the chapel of the Hospital of St. Mary Magdalen. This building, which is now disused, is one of the most venerable in Ripon. It owes its erection to Thurstan, an Archbishop of York, and amongst the objects of interest may be mentioned a fine old oak Perpendicular chancel screen and an ancient plate chest.

It is computed that during Her Majesty's reign upwards of £150,000 has been expended in Church building and restoration in north-east Warwickshire. In Nuneaton the old mother Church has been greatly improved since 1837. In the newer portion of the town, a Church has been built on the ruins of the old abbey. Chilvers Coton Church has been greatly altered since the days when "George Eliot" was a worshipper there. It has been enlarged, restored, beautified, re-seated, and the old entrance re-opened. A movement is now on foot to erect a vestry, and towards this object over £50 was collected at the recent thanksgiving services. Stockingford Church is not like the same place it was a few decades ago, and the sacred building at Anley has been greatly altered by the hand of the restorer. Atherstone Church has improved greatly since the forties, and Meriden Church has come in for a liberal share of attention. In the parish of Foleshill two fine Churches and schools have been built, while the old parish building is much improved and enlarged. The Churches of Corley, Keresley, Astley, Hawkesbury, and Wolvey have been improved, and at Stoke considerable sums have been expended.

MR. BUXTON KNIGHT, best known to the frequenter of the London picture galleries as a regular exhibitor at the New English Art Club, brings forward at the Goupil Gallery a group of pictures and studies in oils and water-colours. There is about this Artist's work, notwithstanding its exaggerations of technique, a certain robust simplicity, a certain sincerity of nature-worship, which go some way towards securing pardon for many sins. Painters of this type are generally seen to greater advantage in *négligé* than in full dress, and Mr. Buxton Knight is no exception to this rule. Such pieces as the Constable-like study of big elm trees, "A Leafy Aisle," and the sunny afternoon scene, "The Windmill near Caterham," are more within his means than works laid out on a more ambitious scale. It is difficult in these last to excuse, even in virtue of a certain colour and atmospheric truth, the heavy, clumsy technique. The main feature of this is such an abuse of impasto, in every part of the canvas alike, that it fails of its true effect, as attained even by Constable, Jules Dupré, and other landscape painters, who have indulged in it certainly beyond the legitimate point.

THE tomb of Alexandre Dumas fils is now completed in the Montmartre Cemetery, and in a day or two the fine recumbent statue of the dramatist by M. de Saint-Marceaux will be removed from the Salon du Champ de Mars to its final destination. There it will rest between four columns of blue Norman granite, which support a massive cenotaph of the same material in the style of that of the Scipios at Rome. Upon the architrave is engraved in letters of gold the name Alexandre Dumas fils, and below on a tablet surrounded by ornamental work of a simple character may be read by way of mortuary inscription a passage from the preface to the "Femme de Claude."

MANY and varied as have been the municipal enterprises of Glasgow in recent years, none has been more remarkable than the

movement for extending the public parks and open spaces of the city. Until a few years ago it was very deficient in that respect, more especially for a town of such a large and dense population. Tollcross Park, the latest addition to the city's property, consists of the grounds, extending to about 84 acres, surrounding the fine mansion of Tollcross, built by David Bryce, of Edinburgh. A feuing plan was suggested to meet the ever-growing demand for houses in the district; but the Corporation stepped in, and for £30,000 purchased one of the most picturesque spots in the neighbourhood of Glasgow for the use of the public.

MESSES. CHRISTIE, MANSON, AND WOODS recently sold at their rooms, King Street, St. James's Square, the collections of modern pictures belonging to the late Mr. J. L. Leathart, Gateshead-on-Tyne, and the late Sir Henry Edwards, of Berkeley Square, W. Some excellent prices were realised, the best items being as follows:—The Merciful Knight, by Sir E. Burne-Jones, 680 guineas; Sybil, by Lord Leighton, F.R.A., 600 guineas; The Frigidarium, by Lord Leighton, 650 guineas; A Winter Scene, by W. Muller, 480 guineas; An Ancient Custom, by E. Long, R.A., 400 guineas; Baiters, by Colin Hunter, 270 guineas; Spring, by J. C. Hook, R.A. 175 guineas; Battledore, by Albert Moore, 150 guineas; Shuttlecock, the companion picture, 140 guineas; The Musician, by A. Moore, 150 guineas; King David, by Lord Leighton, 130 guineas; Modern Cyprus, by E. Long, R.A., 120 guineas; The Entombment of Christ, by Ford Madox Brown, 120 guineas. The sale realised about £7000.

A MEETING was held at the house of the late Lord Leighton, No. 2, Holland Park Road, a few days ago, in order that the delegates who had been appointed by the Vestry of Kensington, the Library Commissioners, and the Royal Drawing Society should confer with the committee of the Leighton House Fund as to the best measures to be taken in order to meet the conditions necessary before the generous offer made by Lord Leighton's sisters—to present his house with the unique Arabian Court and its garden to the nation—can be accepted. Mr. Lionel Cust said that a collection of Lord Leighton's sketches already hanging on the walls of the house had been secured. Resolutions were passed to the effect that it was most desirable that the offer of the sisters of the late Lord Leighton should be accepted, recommending that the house should be vested in some local corporate body for use as an Art library and museum, and appointing a sub-committee to consider the matter and report to a subsequent meeting of delegates.

AT Norwich Consistory Court, Mr. Chancellor Blofield granted a faculty for the restoration of the Church of Shernbourne, near Sandringham. This is a small, flint-built structure, erected in the Early English style, and is stated to have been the second church founded in East Anglia by St. Felix. Its ancient font is one of the finest examples in the county. The fabric was in a very dilapidated condition when, some few years since, the Prince of Wales purchased an estate in the neighbourhood of which the parish forms a part. One of his first acts of ownership was to look to the condition of the little Church in which the parishioners had for centuries been accustomed to worship, and it is due to this thoughtful consideration that the ancient and interesting building is about to undergo the improvement it so much needs. Plans have been prepared by Mr. H. J. Green, the Diocesan Architect, by which the chancel and south aisle are to be rebuilt, new roofs provided, the Church re-seated, and the general repairs of the fabric carried out satisfactorily. The estimated cost of this extensive restoration of a sanctuary which provides sitting accommodation for about seventy people is £1500.

THE London Polytechnic Council, consisting of representatives of the City Parochial Foundation, the City and Guilds of London Insti-

tute, and the Technical Education Board of the London County Council, has unanimously passed a resolution declaring that the objects of the proposed Bill for the registration of plumbers command support, but that the

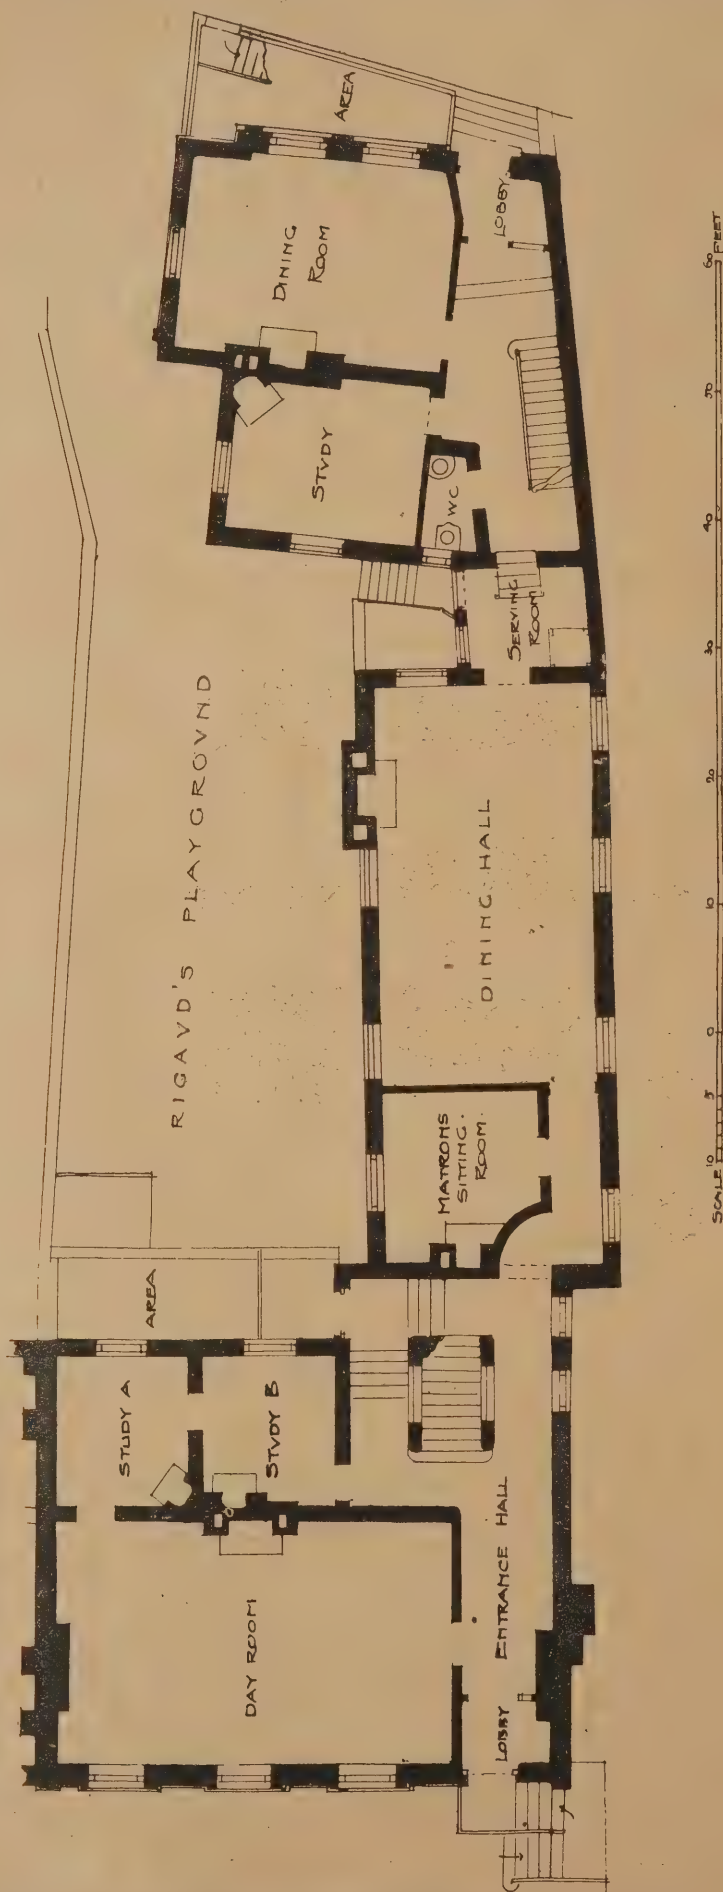

measure requires considerable amendment, including the substitution of some more representative body for the Plumbers' Company to carry out the objects of the Bill. The Executive Committee of the National Association

for the promotion of Technical and Secondary Education has unanimously adopted a resolution generally approving the principle of registration, and expressing the desirability that the General Council under the Bill should be required to place on the register workmen who have passed the examination of competent public authorities approved by the Local Government Board, and that the executive body to carry out the Act should be a committee of members of the General Council.

A SMALL collection of antique and Italian cinque cento bronzes, medals, and other objects of Art, the property of Sir Edgar Boehm, and porcelain and decorative objects of the late Mr. J. J. Farquharson, of Langton House, Blandford, was sold last week. The more interesting lots were as follows:—A very fine Italian bronze group, representing a seated satyr grasping a serpent which is biting the mouth of a tortoise, 4in. high, 51 guineas; a very finely modelled statuette of a rhinoceros, 58 guineas; bust of a lady, with a garland of flowers, a large Roman mosaic, 11in. by 17in., in chased ormolu frame, with inscription in Latin, 145 guineas; a set of sixteen old Dresden figures of monkey musicians, with conductor in costume, 200 guineas; an old Sèvres oviform vase, gros-bleu and œuil-de-perdrix ground, painted with birds and foliage in colours on white ground in two shaped medallions, 12in. high, 180 guineas; a pair of small old Sèvres seaux, each painted with birds and foliage in two shaped medallions, on gros-bleu ground, 120 guineas; a small ecuelle, cover and stand, painted with birds and foliage in six medallions in gilt scroll borders on rose-du-Barri ground, 60 guineas; the Barberini vase, No. 5 of the first 50 copies executed by Josiah Wedgwood by permission of the Duchess of Portland, £78; a Louis XIV. barometer, by Carcany, in cartel case of ebony, inlaid with panels by Boulle, and mounted with a large terminal figure of Cupid, 68in. high, 50 guineas; a Louis XVI. marqueterie secretaire, inlaid with a chemist's laboratory in circular medallion, and trophies of scientific apparatus and instruments, surmounted by a fleur-de-pêche marble slab, 52in. high by 70in. wide, 230 guineas.

AN Exhibition of home Arts and Crafts was held at Bury last week. Original oil paintings formed a very interesting collection, including pictures painted by Miss Ella Rolfe. One represented a view of Christchurch Park, Ipswich; another represented a house in Derby Road, Ipswich. Other pictures were also much admired. Miss Dolly Henderson was awarded the first prize for the painting of an "Old Man's Head." Miss Daisy Cooke gained second. In the class for oil paintings (copy), Mrs. J. Bell, who exhibited a picture of a cart horse, took first prize; Mrs. R. Burrell was second. In the class for water colours (original) Miss A. Payne secured chief honour with her picture "Violin and Books"; Miss E. Burrell (Fornham St. Martin) was second. In the class for water colours (copy) Miss A. M. Simpson exhibited pretty "Cornflowers," which justly took the first prize; Miss Lawrence, with "Guelder Roses," gained second prize. Amongst decorative paintings, fans, china, &c., Miss Manfield (Ixworth Thorpe), with "Afternoon Tea Set," gained first prize; Miss N. Betts showed an oil painting, which secured second prize. Miss G. C. Paine showed a painted velvet cushion, which gained third prize.

THE sculptured stones over the doorway of the High School, Edinburgh, erected more than 300 years ago, on ground to the south of the Cowgate, after having been long missing, were recently discovered. They were known to have been removed to the present High School, but a search for them had proved fruitless, and it was feared they had been broken up. Mr. Falconer found them laid away with their faces to the wall in one of the school presses. The stones, which are in fine preservation, have now been let into the outside wall of the hall of the present school over the north-west doorway, so that they again surmount one of the entrances. They have

GROUND PLAN OF BOARDING-HOUSE, WESTMINSTER SCHOOLS. T. G. JACKSON, R.A., ARCHITECT.

been placed in their present position under the superintendence of Mr. Henry F. Kerr, Architect. The building of which the stones at one time formed part was begun by the Town Council of Edinburgh in 1577, during the boyhood of James VI., the Earl of Morton then being Regent. They thus form an interesting

the arms of the city, the triple-towered castle, but without supporters. On the one side there is the letter J., and on the other S., probably for James—Sextus. Beneath the arms is the motto "Musis respublica floret," with the date 1578. The stones measure nearly 5ft. in height, by about 3ft. in breadth.

engaged in excavating the great mounds of Nuffar, in Northern Babylonia, the site of the ancient city of Nippur, the sacred city of Mul-lil or the "Older Bel" of the Semites. The history of the expedition which, since 1888, has worked upon this site is a remarkable one; and its great work has been so quietly done

NEW BOARDING HOUSE, WESTMINSTER SCHOOLS. T. G. JACKSON, R.A. ARCHITECT.

relic of Edinburgh in the days of the old Scottish Monarchy. The stones are two in number, the under square, the upper forming a triangular pediment, and the whole being surmounted with a deeply cut border. In the pediment there appears the Scottish crown, and under it J. R. 6, with a fine display of thistle at each side. The under stone bears

To have unearthed the ruins of the oldest city in the world, the foundations of which were laid some six or seven thousand years before the Christian era, is a reward of which an explorer might indeed be proud. Such good fortune seems to have fallen to the lot of Mr. Haynes, who for nearly five years has been in charge of the American expedition

that it has attracted but little attention except among students of Assyriology. The work was undertaken by the University of Pennsylvania, the funds, which have amounted to about 70,000 dollars, being provided by a small committee interested in the work. The expeditions of 1888-90 partook rather of a prospecting survey, and were under the direction of Dr

Peters. The trial trenches produced a harvest of about 10,000 tablets and inscribed objects, among them several records of Sagon I., and his son, Naram-Sin, whose date B.C. 3800 was by many regarded as the starting-point of Babylonian history. Troubles among the Arabs and the usual difficulties with the Porte delayed the work for three years. In 1893 the explorations were renewed under the charge of Mr. J. H. Haynes, and they have been carried on continuously ever since, and have produced results such as were never dreamt of even by the most ardent advocate of Babylonian explorations, and the history of civilisation has been carried back to an antiquity never thought of.

In an article dealing with the effects of the Norman Conquest, a contemporary says:—"One feature which the 'coming of the Normans' bestowed on the Church of England has remained, however, all through the eventful centuries. That is, the number of mighty Norman Churches. They are with us still, in all their changeless solemn beauty, bearing their voiceless testimony to the long and splendid story of the Church of England, so indissolubly bound up with the life and well-being of the nation. When we speak of the 'coming of the Normans,' and of the momentous changes which the one great battle and the conquest which followed brought upon the English people and their Church, few realise how far-reaching in their effects many of these changes really were; but when we point to our great Cathedrals, to our lordly Abbeys, all of them due to the new spirit infused into the hearts of Churchmen by that wonderful race of conquerors, the appeal at once goes home, and the greatness of the Norman and his work is recognised by the mass of our people. As men gaze on these vast piles, some of them beautiful and strong as in those far-back days when William the Conqueror and Matilda his Queen took counsel with their wise friend Lanfranc, they naturally and wonderingly ask 'Whence came the gold needful for all these stupendous and enduring works?' We may reply with very little hesitation, that the prelates and the abbots to whose loving care and far-seeing genius we owe these glorious Abbey-Churches were assisted by a deep feeling of remorse which took possession of the Conqueror and his Queen, and many another of his knightly comrades; remorse for the deeds of blood and violence which, alas! accompanied the Norman conquest—remorse for the widespread misery which their greed of gain and lust of power had brought upon hapless England. These Norman Cathedrals and Abbeys were Cathedrals and Abbeys of expiation."

THE question of Church organs and their position still causes much interest. "Septuagenarian," in a letter to the Times, says:—"Architects are the natural enemies of the organ. There should be a set of metal diapasons in every Cathedral, the lowest of which should measure 32ft. from the mouth, but the Architect fears to dwarf the arches and puts his veto upon them. Thus the heavy reed pipes are ungoverned and produce unpleasant, unmusical, and harsh vibrations. The business of the Architect is to put away the organ somewhere—anywhere out of the Church. Some ornamental pipes may peep out here and there, but that is not enough for the expression of the instrument. Of one thing I am certain—notwithstanding all the improvements introduced into the mechanism of the organ, the modern instrument is no more to be compared with the production of the great organ-builders of the Georgian era than a new fiddle with a Stradivarius violin! Now there is, in my humble opinion, no reason why the latter should not be forthcoming to-day as well as the former. There is wood to be found in London to match the Stradivarius material—the model is well known. Just the same care in the selection of wood for organ pipes, and patient preparation, was a feature of the organ-building of a century or two ago. Now too much of the timber laid down for organ work is seasoned by machinery, and the important element of

time is not sufficiently considered. It is a popular error to suppose that age improves the tone of musical instruments. With regard to the metal used in organ-building, the use of zinc in the large pedal pipes has killed the grand old organ tone. Zinc is cheap, light, and handy. A tube of zinc of a given capacity will produce the same note as if it were made of pure Cornish tin and virgin silver lead, as it should be. But a hungry, grinding tone will pervade the whole instrument from the zinc base, while a full, rich, mellow sound will result from the latter. Again, the increased variety of stops, or, more properly speaking, registers, has made the modern organ a far more costly instrument, if the old effects are to be maintained. I fear that modern builders are so bent on the production of orchestral effects that they 'scamp' the necessary amount of expensive metal and wood of time-enhanced value to obtain the real organ tone. It is a fact that an old rebuilt gallery organ is of far superior tone to any modern instrument. The reason of this is solely because there is good material in the old pipes, especially the large pedal pipes. I deeply regret the decadence of really good organ music since the Gothic revival of the Victorian age. An organ built in 1837 by an eminent builder regardless of cost was a genuine instrument, though, even then, not, perhaps, reflecting so well the personality of the maker as one erected in the eighteenth century, nor yet that so thoroughly as a seventeenth century instrument. But I deplore the very much too patent fact that I know not where a really fine new diapason organ is now to be got for love or money! In the Austrian Tyrol there are some lead mines very rich in silver-lead ores. If the clergy under the fostering care of the Bishop of Chester would see that such lead with pure Cornish tin is used in generous quantities for all flue-pipes, with carefully selected old time-seasoned wood, we may yet remove from the longest reign the slur that organ building has become a lost art."

LIVERPOOL is richer in statuary than most persons know of. The reburnishing of Marochetti's effigies of the Queen and the Prince Consort, on the plateau of St. George's Hall, has been completed, and now Birch's statue of the Earl of Beaconsfield, which also occupies a commanding position there, is being touched up. Be the hope reiterated that that other and finer work of Art by Birch, the statue of General Earle, will be subjected to a similar process. It is understood that the equestrian statue of George III. which stands in Monument Place is, in colloquial phrase, to be "done up."

AFTER many postponements, the scheme for joining Great Britain and Ireland seems at last to be within measurable distance of realisation. The tunnel once decided upon, the various schemes, of which there are five, would have to be carefully considered. If the selection were a mere matter of convenience, much could be urged in favour of a tunnel between Holyhead and Kingstown, but the great depth of the water, to say nothing of the distance, presents insuperable obstacles. The nearest points of the two countries are the Mull of Cantyre and Tor Point, County Antrim, a distance of only thirteen miles. But Tor Point is such a desolate, out-of-the-way spot, and to reach the end of Cantyre would involve such a long journey northward, that the advantages of so short a tunnel would be quite neutralised. Notwithstanding these drawbacks the route has attracted considerable attention. A tunnel between Cantyre and Tor Point would cost about £6,000,000, with an additional million for the gradients. The largeness of this estimate is due to the uneven surface of the bottom. The routes of the other schemes congregate about Portpatrick, on the coast of Wigtownshire. The shortest would connect Portpatrick and Donaghadee Island, a distance of twenty-two miles. The bottom here is extremely level, and in this respect has great advantages over Cantyre, where the declivities are very deep, though, on the other hand, the great depth of water (600ft.) four miles from the Irish coast, increasing

to 900ft. on the Scotch side, would greatly add to the expense. The deeper the tunnel the greater the cost of gradients. As depth seems to be the most important consideration, a good deal can be said for a tunnel between Magee Island—which is north of Whitehead—and Wierston Hill, Wigtown, north of Stranraer. By making a detour to avoid a deep hole, a mean depth of no more than 500ft. could be secured. The curve, however, would increase the length to twenty-six and a half miles. The longest of all the proposed tunnels would be one from Larne to Stranraer, a distance of thirty miles. As deep pools would add to the cost of tunnelling, a novel suggestion has been put forward which would abolish tunnelling altogether. A bridge inclosed in a continuous cylinder, sunk some 50ft. below the surface, and kept in its position by anchors and chains, would no doubt be extremely ingenious, but the estimate (£25,000,000) is too large a sum to risk on what might, after all, prove a failure. Taking all the routes, the one between Larne and Stranraer seems open to the fewest objections. The bottom is not so level as that between Portpatrick and Donaghadee, but by keeping north of Beauford Dyke the depth would not exceed 500ft. As tunnelling operations invariably exceed the estimated expenditure, the cost of any of the schemes we have dealt with would probably run into £12,000,000, a small sum when the advantages to be gained are considered.

A STATUE of the Duke of Norfolk is to be erected in Sheffield to commemorate his services as Mayor.

MR. G. T. Lynham, assistant burgh surveyor, Aberdeen, has been unanimously elected surveyor of Burton-on-Trent.

AT Horsham the permanent memorial of the Queen's reign takes the form of an ornamental drinking fountain, to be erected in the Carfax.

ST. COLUMBA'S, the new Presbyterian Church of England at the Smithdown Road gate of Sefton Park, Liverpool, is approaching completion, and will be opened early next month.

ON Friday, at Scarborough, was laid the foundation stone of the new marine drive and promenade round the Castle Hill, to connect the two bays.

A NEW Wesleyan Mission Hall and Sunday school erected in Jennings Street, Hull, was opened last week. It has cost £2900, and the central hall will accommodate 600 persons.

THE permanent Jubilee commemoration at Cardiff will be the building of a seamen's hospital at a cost of from £30,000 to £40,000, towards which Lord Bute has contributed £5000, and a site at Bute Docks.

AT Morecambe the foundation-stone of the new promenade from East View to Bare, a distance of a mile, and which is to be called the Victoria Esplanade, was laid last week by Mr. C. J. Clark, of Crosshills.

PROFESSOR HERKOMER has finished the portrait in oils of Mr. R. D. M. Littler, Q.C., C.B., which he was commissioned to paint by the Middlesex County Council. It is at present on view at the Artist's studio, and will shortly adorn the walls of the Sessions House, Westminster.

THE Master and Fellows of St. John's College, Cambridge, have presented the Rev. George Smith, rector of Great and Little Horstead, Herts, to the living of Houghton Conquest, near Amptill, which is worth about £600 a year, the rectory being a picturesque moated house, which was built by Dr. Zachary Gray, the editor of "Hudibras."

THE Street Syndicate, Limited, having asked the St. Pancras Vestry for the concession of appropriate sites in that parish whereon the syndicate might erect illuminated kiosks for the sale of newspapers, flowers, &c., the vestry has declined to grant the application. It did so on the recommendation of the Highways Committee, "which is strongly of opinion that it is not advisable to entertain the application, because it is considered inexpedient to allow the syndicate to have possession of any portion of the public way; and, moreover, the development of the scheme would probably interfere with the industry of many poor itinerant vendors and shopkeepers."

## DISINFECTION.\*

## PHYSICAL, CHEMICAL, AND MECHANICAL.

(Continued from page lxxix.)

By W. NOBLE TWELVETREES.

LYONS.

PROBABLY the best known apparatus is Washington Lyons' Steam Disinfector patented in 1880. The patentee, in his specification, claims the combination and arrangement of an inner and outer chamber, the former charge during operation with high pressure steam, the latter with steam preferably of higher pressure to prevent condensation. The usual form of the apparatus is oval in section, and doors are provided at either end for the better separation of infected and disinfected goods. During disinfection the articles are placed in a cage of wire netting with a strong iron framework fitted on wheels, so as to be readily removed. The boiler supplying steam is kept distinct, except in locomotive types, and gases exhausted from the chamber are caused to pass through the boiler furnace. As now constructed, the apparatus is fitted with a vacuum-producing apparatus, patented by Alliot and Patin in 1888. The objects of this auxiliary appliance are to increase the rapidity of penetration, and to give greater facility for efficient drying, by the re-evaporation of moisture in a partial vacuum. The drying operation is further aided by a current of air, preferably heated by steam pipes. Disinfection and drying occupy about forty-two minutes, during which period the vacuum apparatus, hot air, and steam are frequently used, in order to secure better penetration of steam by removing air from the pores of the articles. There is no doubt that the Lyons' Apparatus is thoroughly efficient, and as it is made in various sizes, and may be used either as a high or low pressure machine. Or as a current steam disinfector, it fulfils all reasonable requirements.

GODDARD'S.

The Nottingham Steam Disinfecting Apparatus was formerly well-known as Goddard's patent. The validity of this patent was, however, questioned by Mr. Lyons. Litigation ensued with two important results, one being the usual advantageous augmentation to legal banking accounts, the other a decision favourable to Mr. Lyons. The apparatus is now, therefore, made pursuant to a license granted by Mr. Washington Lyons. In construction the disinfector consists of an inner chamber and jacket both of rectangular section. Outside the jacket is a hot air space formed by the brickwork in which the apparatus is seated. Heat is supplied by a furnace, and the jacket, being half-filled with water, forms the boiler. The apparatus is furnished with means of heating air, and an exhaustor for causing circulation of the heated air as required. The doors at each end of the chamber are hollow, and connected to form part of the boiler. The method of working is as follows:—The fire is lighted, the chamber filled and the doors secured. Steam when raised blows off at 20lb., the safety-valve being sufficiently large to prevent increase of pressure. The exhaustor is started, causing a current of hot air to pass through the inner chamber. Steam is admitted until it blows off at the safety-valve. Treatment by steam continues for twenty or thirty minutes, the exhaustor being then opened, allowing steam to escape. Hot air is then introduced to remove steam and moisture remaining. The temperature of air is regulated by means of a thermometer and cold air valve. The apparatus is equally adapted for use as a pressure or current steam disinfector, and its simplicity renders it very serviceable where unskilled labour is chiefly available, and in institutions where steam services cannot be conveniently brought for disinfecting purposes. The apparatus is made in sizes to suit all requirements. The efficiency of high-pressure machines may be regarded as undoubted, but

the outlay necessary may sometimes tend to prohibit or discourage their general employment, especially in parishes and institutions with limited finances.

THRESH.

This disadvantage has been realised and successfully combated by Dr. Thresh, Medical Officer of Health for the County of Essex. His apparatus is operated by means of a continuous current of steam passing through the chamber during the process of disinfection. The steam-valve is so constructed that either the direct exit to the flue, or the indirect exit through the chamber, is open to the boiler. In either case the boiler is open to the atmosphere. The Equifex is another apparatus now made in this country, and intended for use with steam at a pressure of 10lb. per square inch. It is also made, but not recommended, for use with steam at 3lb. pressure, and for current steam at atmospheric pressure. Amongst Continental machines, one of the best known is Schimmel's apparatus, largely used in Germany and to a limited extent in England. The larger types of Schimmel's disinfector are very similar in general arrangement to the Equifex, being circular or oval in section, and fitted with one or two doors as required. Low-pressure steam is employed and obtained from a separate boiler. In the lower portion of the chamber, which is non-jacketed, is situated a double coil of gilled pipes heated by steam. The articles are placed inside, on a suitable carriage, after the interior has been warmed for about thirty minutes. The doors being closed, the articles are warmed for another period of thirty minutes. Steam is then admitted to the interior, and disinfection continued for thirty minutes. After disinfection, heated air is passed through the apparatus for about a quarter of an hour, and the clothes removed. Thursfield's disinfector, used chiefly in Austria, was originally designed for disinfection by the combined effect of hot air and steam. The steam was generated in a separate open boiler, whose steam outlet was connected in such manner with an apparatus for heating air, or with the chimney, so that hot air alone, or mixed with products of combustion, would be drawn into the chamber along with the steam. Reck's disinfector, made in Copenhagen, is one deserving attention. The apparatus is circular or rectangular in section, with doors at each end, has no jacket, and is worked with low-pressure steam. No provision is made for drying. The machine has a cold-shower apparatus for removing vapour after disinfection, but this appears to have no effect on the quantity of moisture contained in the articles. America, the land of patents, has produced nothing novel in the form of disinfectors, the Lyon Apparatus and a local type, similar to the Equifex, being chiefly in use.

WASHING AND DISINFECTING.

In addition to these, the Americans make use of steam washing and disinfecting machines, which have also been made for many years in this country. As this form of apparatus fulfils all conditions necessary for true disinfection, it may be here briefly described. A stationary cylinder, preferably of steel plate, having a closely-fitting hinged door, is mounted on supports. Inside is a tubular or perforated metal cage, to which a rotary motion may be imparted by suitable gearing. Valves are furnished for the admission and removal of water and steam, and the machine should be fitted with safety valve, vacuum valve, steam and water gauges. The better types of this appliance are capable of withstanding 40lb. to 50lb. steam pressure per square inch, although it is not really necessary to use more than 20lb. pressure in ordinary cases. The act of washing having been performed, the articles are boiled by steam, and the water being then removed, steam is again admitted to complete the destruction of any organisms surviving. Before opening the door, steam should be condensed by a spray of cold water. The articles may then be removed for finishing in the ordinary manner. This form of apparatus is employed with great advantage in hospitals and workhouses to guard against accidental

contagion and to purify the clothing of tramps and others.

DISINFECTING STATIONS.

Having now reviewed the leading forms of apparatus, the arrangement of the disinfecting station may advantageously be considered. It is important that every precaution should be taken to guard against re-infection, which may easily occur if infected goods are not rigidly isolated from disinfected articles in the disinfecting station or room. The building should be isolated, if practicable, and provision made for the free access of light and air. The interior walls should be covered with white glazed brick or tiles, the ceiling with cement, and the floor of impervious material. It is desirable for all corners to be rounded, and the floors properly drained. Tanks containing liquid disinfectant, and hose-pipes for cleaning the interior, are necessary. One room should be provided for infected articles, and another, with separate entrance, for disinfected articles, the disinfector being built in the dividing wall. The doors of the apparatus should be made so that only one can be opened at a time. Two attendants are necessary for properly working the apparatus, and the attendant on the infected side ought not to communicate with the disinfected side, except by telephone or some means of signalling. All air used for drying purposes should be brought direct from outside, and all gases escaping from the chamber should pass through the boiler furnace, if possible. Articles received for treatment are preferably placed on slate benches, no wood being used, and it is important to include a lavatory basin for use of the attendant on the infected side. A suit of overalls should also be furnished for the attendant, which may be disinfected after the completion of work.

INCINERATION.

The modes of disinfection so far described are intended to destroy germs contained in articles, and without injury to the material. It happens, however, that in many hospitals dangerous material has to be disposed of, which is not of sufficient value for treatment in the ordinary manner, and, if buried, will be preserved to form future danger to public health. The best mode of disposal is afforded by a cremator or incinerator, constructed in such a way as to destroy the material and also to completely consume the vapours given off. The most largely used apparatus of this kind are Dr. Sergeant's Incinerator and Mason's Patent Cremator. Similar appliances, but intended for larger quantities of refuse, are well-known as refuse and dust destructors, constructed in one or more cells. There should be an entire absence of smoke, smell, and dust. Combustion must be perfect, both as regards refuse and gases given during destruction. In addition to their advantages from a sanitary point of view, destructors afford a very economical means of raising steam for various municipal purposes.

CHEMICAL DISINFECTION.

The use of chemical agents for disinfection, as already stated, dates from the remotest ages, and is still popular. Too much reliance must not be placed on this form of disinfection, for, notwithstanding their powerful appeals to the olfactory nerves, it is probable that, as usually employed, chemical disinfectants have little or no effect on micro-organisms. As antiseptics, chemicals are of the greatest value in surgery, for though they may not kill the germs, development is checked to a marked degree. Again, chemicals have the power of oxidising poisonous bacterial products. To kill the organisms themselves, especially those existing in air, is a more difficult task, for they possess vitality far higher than that of man, and are also protected by an envelope of dried albuminous matter. No man could endure an atmosphere which would suffice to kill these forms of microbes. Only chlorine, bromine, and iodine will penetrate their skins and oxidise the contents of their cells. Amongst chemical substances used in solutions, bichloride of mercury is considered the most powerful. In solutions of one part to 10,000, it is an effective disinfectant as regards some forms

\* A paper read before the members of the Civil and Mechanical Engineers Society.

of bacteria. Carbolic acid is considered by Klein to be of doubtless efficacy as a disinfectant, though useful in surgery. Izal, one of the coal-tar products, has been proved by Klein to possess remarkable bacterial effects. A solution of 1 in 200 kills germs of diptheria, typhoid, cholera, erisipelas, and scarlatina in five minutes. Essential oils are useful for purifying air and act as insecticides. Eucalyptus oil is anti-malarial; "Sanitas" disinfectant, in 1 or 2 per cent. solutions, oxidises most organisms, and is considered more efficient than carbolic acid and creosol. Chemical disinfection cannot be effectively employed, being manifestly unsuitable for textile fabrics, whilst in drains chemicals would require to be used in enormous and practically impossible quantities to produce any thing approaching complete sterilisation of the liquid. Fumigations are considered of little value, owing to their want of penetration, and they are described by eminent authorities as "illusory specifics giving a false sense of security."

#### MECHANICAL DISINFECTION.

Turning from these unfavourable criticisms, it is pleasant to find more satisfactory results are obtained from mechanical modes of disinfection. Charcoal, in its various forms, is of service as an absorbent and deodorant. Peat has considerable power of absorbing moist and noxious exhalations, and exercises a true disinfecting action on cholera germs. Filtration, both natural and artificial, is practised, far more widely than any other means, for the benefit of mankind. This most important function is largely performed by natural filtration in the soil, and renders spring water almost sterile. It is not, however, possible to depend wholly on spring water, and artificial filtration is therefore necessary. The efficiency of sand filters is instanced by the laboratory air filter before mentioned, and Dr. Frankland, in a report on Thames water, states that 98 per cent. of the organisms are removed by sand filtration. A striking example of the necessity for filtration was afforded in 1892, during an epidemic of cholera at Hamburg. The water supply was then unfiltered, and the death rate averaged 1250 per 100,000, whilst in the adjoining town of Altona, possessing a filtered water supply, the rate was only 221 per 100,000. Filtering operations are materially aided by the use of settling reservoirs, in which water is freed from injurious germs by deposition, by the oxidising effect of light (extending downwards as far as 10ft.), and by the destruction of harmful germs by the inoffensive species, the latter thriving best in water. So powerful is the action of water bacteria that Mr. Scott-Moncrieff has patented a process involving the cultivation and employment of these varieties to prey upon and destroy the harmful types in rivers and streams. Besides filtration, another purifying process of great utility is water softening, which not only deposits carbonate of lime, but carries down also organic and other impurities. At Hampton this process has been found to reduce the number of germs in Thames water from 1435 to 177 per cubic centimetre. Dr. E. Frankland, in a report to the Rivers Commission, recommends that water companies should be compelled to lay down water softening plant before being allowed to raise further capital. One of the most reliable forms of water softening plant is the Porter-Clark Apparatus. Dr. Percy Frankland found the effect of this was to reduce the number of germs in water by ninety-nine per cent. However useful filtration and deposition may be, there are always some germs left to reproduce the species, and, even if all were removed, their poisonous products would not be intercepted by filtration. The absolute sterilisation of water supplies for towns is a question which has been considered, and a proposal was made by Baron Tyndall to provide a sterilised water supply for Paris. Ozone was the agent suggested for the destruction of all microbes and organic impurities. The Equifex Water Steriliser is already used in hospitals, sterilisation being effected by heat, and the water afterwards filtered to restore its natural characteristics. Whether this process would be practicable on a large scale remains to be

ascertained. Certainly, in a matter of so much importance to the welfare and health of the community, no effort or expense should be spared to attain so desirable an end as the free and abundant supply of absolutely pure water. Disinfection, in the widest sense of the term, involves the subjugation of all injurious organisms, not merely by the limited process of destroying small numbers in public institutions, but by the universal creation of hygienic conditions. Our cities, towns, and villages, with their streets, slums, and alleys, must be thoroughly cleansed. Our people must practice cleanliness in their homes. They must have ample supplies of pure water, fresh air, and light. Drainage, sewage, and refuge of all kinds must be universally subjected to proper treatment. Isolation in all cases of contagious disease should be insisted on, and facilities for bathing and personal cleanliness should be still further extended throughout the length and breadth of the land. When these things are done the evil presence of disease will no longer hover near our homes.

#### SALE OF THE ASHBURNHAM LIBRARY.

THE eight days' sale of the first portion of the magnificent collection of books, the property of the Earl of Ashburnham, commenced at Messrs Sotheby's on Friday, and attracted a large number of book collectors and booksellers. This library was mainly and, so far as regards the more rare and valuable books, exclusively formed by the late Bertram, fourth Earl of Ashburnham, who was born in 1797, and died in 1878. The world-wide reputation of the earl's matchless collection of MSS. has somewhat eclipsed his achievements in other directions, and it has even been supposed that his purchases of printed books were merely incidents in a pursuit of which MSS. were the principal objects. This, however, was far from being the case, since he only possessed a very few MSS. up to the year 1847, when he inaugurated a new departure by acquiring nearly 2000 *en bloc* for Libri. As a matter of fact, he was constantly buying books from the year 1814, when as a boy at Westminster School he purchased a copy of the "Secrets of Albertus Magnus" for 1s. 6d. (this was sold for £2 8s.) at Ginger's well-known shop in Great College Street, down to the end of the year 1877, six months before his death. He was not an "omnivorous collector." But he took care that on the lines he drew out for himself as a collector he would have the rarest editions that could be obtained, and as far as was possible the most perfect copies. Hence we find several copies of rare books, purchased one after the other in the endeavour to obtain one perfect copy. The collecting of Bibles and Testaments in various languages (but especially English), Missals, Horæ, Breviaries, Offices, Prayers (public and private), and other early religious service books was his strong point. But here, also, he confined himself to the rarest editions he could obtain, or to copies of more common editions having some historical or family interest attached to them. Although not a searcher after bindings (as bindings), he yet managed to procure some singularly fine historic and artistic specimens. Outside his special liking for early religious books, his tastes were as broad as the rarity of the books introduced to his notice, and were very largely connected with the earliest editions of the first English writers and works from the earliest English presses. So we have his probably unique collection of the editions of Dame Juliana Barnes's Book of St. Albans, his series of early editions of Chaucer, the comparatively large number of specimens of the presses of Caxton, Wynkyn de Worde, Pynson, Julian Notary, Letton and Machlinia, Thomas Godfrey; the first printers at St. Albans, Oxford, and Ipswich, and many other English printers before the death of Queen Elizabeth. If there is one species of rare book which the late earl preferred to another it was copies printed on vellum, of which he procured an unusual number.

## Professional Items.

ABERDEEN.—The magistrates of Aberdeen have had under consideration plans of the proposed alteration on Her Majesty's Theatre. The plans provide for the abolition of the shops on the ground floor, thus permitting better access to the pit and stalls. It was resolved to obtain a report from the Burgh Surveyor before finally deciding on the plans, which were considered very satisfactory.

BELFAST.—The foundation-stone of the new Church of St. Vincent de Paul, Ligoniel, Belfast, was laid in its place in the north pier of the chancel arch on the 21st inst. The new Church will seat about 1300 persons. The nave walls are now about ready for roofing, and when completed the fine Gothic building, with its rock-faced ashlar work, will present an imposing appearance. It stands on a splendid site, and faces the road. The building consists of nave and aisles, the general dimensions being 100ft. by 50ft. and 50ft. from floor to ridge. There are five bays on each side of the nave, and a projecting semi-octagonal apse, with which is connected a large sacristy, and a commodious meeting room on the first floor above the latter. The floor is raised about 17ft. over the level of the footway, and massive columns of Aberdeen granite with dressings of Scotch-sandstone support the ornamental roof. Close to the sacred edifice will be erected new schools and a presbytery, plans for which have already been prepared. The contractors are Messrs. Courtney and Co., Shaftesbury Avenue, and the Architect Mr. J. J. McDonnell, Chichester Street, Belfast.

BETHNAL GREEN.—The whole of the wrought iron gates, railings, grilles, &c., fitted at the new Mortuary and Coroner's Court, Bethnal Green—under the London County Council—have been supplied and fixed by Thomas Brawn and Co., of Birmingham.

BRADFORD.—The corner stone of the new girls' and infants' schools in connection with St. Mary's Church, which are being erected at Stott Hill, was laid recently. The new schools are being erected from designs by Mr. Edward Simpson, Architect, of Bradford, and will be similar in the style of Gothic adopted to the other Catholic schools in the town. They will have accommodation for about 1200 children. The cost of the schools is estimated at about £6000, towards which a substantial sum is already in hand. The basement of the building will contain recreation rooms for the Young Men's Society, the ground floor will contain a schoolroom about 110ft. long and about 45ft. wide, and the first floor will be divided into class rooms. A wing of the building will provide cooking accommodation, rooms for manual training, &c. The contracts have been let to the following firms: Masons, Messrs. Wray and Co.; joiner, Mr. W. H. Pick; plumbers, Messrs. Wearden and Roscoe; plasterers, Messrs. Bland and Son; slaters, Messrs. Thornton Bros.

CLEETHORPES.—A permanent memorial of the Diamond Jubilee is being erected in the form of a fountain near the junction of Sea Road and Alexandra Road, close to the entrance to the Victor Gardens, which were opened by the late Prince Albert Victor of Wales. The fountain, when completed, will be a dome-covered structure, surmounted by a lamp.

DUBLIN.—The entrance to St. James's Church has been much improved by the erection of a railing in place of the ruined houses which occupied the front of the street. The new pulpit and reading desk of Caen stone, marble, and alabaster, erected by Messrs. Harrison and Son, Brunswick Street, is now completed. The upper part of the chancel has been laid in handsome mosaic by Messrs. Edwards, of Ruabon, and brass Communion rails put up by a Dublin firm, as well as painting and other improvements effected.

**DRIGHLINGTON.**—The memorial-stones of new Sunday schools connected with the Wesleyan Church at Drighlington were laid recently. The building, which is to consist of a central hall with seven class-rooms and caretaker's house, is estimated to cost £1500, and has been designed by Mr. Walter Hanstock, of Batley. It is to be built by Messrs. George Holdsworth, of Gildersome.

**GLOSSOP.**—Four memorial-stones of a proposed new Wesleyan Reform Chapel for Glossop were recently laid. The new building, which is estimated to cost £2300, is being erected in consequence of the old chapel having been condemned as unsafe. Mr. Charles Fielding, Glossop, is the contractor for the new building, and Mr. J. Lindsay, of Hyde, the Architect.

**KILDWICK.**—At a recent parish meeting Mr. Peterson, Architect, Bradford, reported upon a recent examination of the Church. He stated that three bays of the choir were 6in. out of the perpendicular. The centre pillar of the south aisle was considerably damaged, and this fixture was not only insecure in itself and dangerous to the public, but was also an eyesore. He considered that the north and south arcades should be rebuilt, and that the roof of the Church should be reslated. He estimated the cost at about £1200. A committee was appointed to deal with the matter.

**LINCOLN.**—The new portion of the Odd-fellows' Hall in Broadgate and Unity Square was opened last week. The building consists of three stories and a basement, and has a frontage to Unity Square of about 66ft. and 31ft. to Broadgate. On the ground floor there are five offices, and there is also an entrance independent of the main entrance to the hall. On the first floor there is a connection between the old and new portions of the hall, and three large lodge-rooms. The second floor contains three committee-rooms, and a house for the caretaker with other accommodation. The outside is built of local red brick with stone dressing, and the style of Architecture is of the English Renaissance. The builders were Messrs. Marshall and Harrison, Lincoln, and the total cost is about £1400. The Architects were Messrs. Mortimer and Son, Lincoln.

**LUNDY ISLAND.**—The consecration of the new Church on Lundy Island took place a few days ago. Mr. John Norton, the Architect, has designed an edifice at once ornate and substantial enough to stand as long as will the grey granite rock itself upon whose headland it has been erected. The style is very Early Decorated, the same as was the former Church, which, built in the late years of Edward I.'s reign, is now nothing but mouldering foundations. The new Church is small. Seating accommodation for 160 worshippers has been provided. The measurements inside are as follow:—Nave, 50ft. by 28ft.; chancel, 25ft. by 25ft.; and vestry, 14ft. by 16ft. The tower is 65ft. high. The various roofs are of steep pitch, and covered in by split stone slabs from the Ledbury (Gloucestershire) Quarries, an oolite reputed to have almost perpetual lasting powers for roofing. Under these stones is a double lining of felt upon the inner roof. The ridges are of red terra cotta, and the cornice angles of tower and turret are defined by projecting carved gargoyles. The eastern window is kept well up, so as not to cut into the reredos. The building is of finely axed granite, the island's own light grey variety, quarried and exceedingly well masoned on the spot, with dressings from the ancient Douling Quarries in Somersetshire. In a niche is a larger statue of St. Helena, by Mr. Harry Hems, of Exeter.

**MIDDLESBROUGH.**—The necessity of increased accommodation at Trinity Presbyterian Church has long been felt. It was therefore decided to occupy the whole of the available land at the side of the Church for this purpose, and the matter was put into the hands of Mr. W. G. Roberts, Architect, Albert Road, Middlesbrough. The memorial-stone of the new buildings was laid a few days ago.

On the ground floor from the entrance hall in Corporation Road a doorway leads into a room 55ft. by 26ft., and so arranged that it will be possible to divide it into three class-rooms by movable sliding partitions from floor to ceiling. At the end of this room there will be another class-room, with a separate entrance from Elm Street. The lecture hall will be 55ft. by 27ft., with a platform at the end. There is a retiring room at the rear of the hall on first floor, 31ft. by 17ft., available for dividing in two. A separate staircase leads to these rooms. The ground floor rooms are 15ft. high, while the lecture hall is 23ft. 6in. to the ceiling level, and is covered with an open timber roof. The elevation into Corporation Road will be faced throughout with first quality Normanby red pressed bricks, relieved with stone dressings. The elevation into Elm Street will be faced with Linthorpe red pressed bricks, relieved with Normanby brick arches and eaves courses. The total cost of the building and furnishing is estimated at about £1400. Messrs. Perks and Son, of Stockton-on-Tees, are the contractors.

**NOTTINGHAM.**—The work on the Nottingham section of the Manchester, Sheffield, and Lincolnshire Railway Company's extension to London proceeds with marked facility, and several new departures have recently been entered upon. The concrete foundations of the engine sheds at Annesley are now practically finished, while the brickwork and pits upon which the structure will be erected are now being proceeded with. The engine shed for the goods yard at Nottingham is also in hand, the concrete foundations being completed, and the brickwork of this, the goods warehouse, and other buildings is in course of construction. At the site of the Central Station, Nottingham, the work progresses very rapidly indeed, bearing in mind the great obstacles the engineers and contractors have had to face. The permanent way on the up line is now practically completed between Annesley and Haydn Road Station, with the exception of about three-quarters of a mile through the rock cutting at Hucknall Torkard. With respect to the Great Northern Company's extension, the work is making very satisfactory progress on the section in the vicinity of London Road, and the bridge there over the canal is already fixed. The contractors will be prepared to start on that piece of the extension from the line to Grantham which is to skirt Meadow Lane very shortly.

**PITLOCHRY.**—The new post office building at Pitlochry is of good design, and has a frontage of 130ft. The ground flat will consist of business premises, of which the principal will be the new post office, which occupies a position in the centre. The accommodation will consist of public office, telegraph-room, sorting-room, waiting-room, and other necessary space. The upper floors of the building will consist of dwelling-houses, while cellars will be situated in the basement. The plans were prepared by Mr. John Leonard, Architect, Pitlochry. The total cost will be upwards of £5000.

**ROTHERHAM.**—At a special meeting of the Rotherham Town Council, held to consider the minutes of the Gas Committee meeting of the 12th inst., a report by Mr. Winstanley, consulting engineer, relative to the extension of the gasworks to enable the Council to meet the requirements of the coming winter, was received. The engineer said other extensions were necessary, but, having so short a time at their disposal, their first care was to provide sufficient gas-producing power to meet the demands of the public next winter. He therefore deferred the extension of the purifiers, station meter, &c. Mr. Winstanley went on to explain the various necessary works in order to produce 500,000 cubic feet of gas per day of twenty-four hours. The estimate of cost was £8000. He suggested that the contractor should be responsible for the completion of two beds of retorts, capable of a production of 160,000 cubic feet of gas per twenty-four hours, and by the 31st of October next. The report was adopted.

**ROTHERSAY.**—The new non-infectious hospital at Rothersey, built at a cost of £3000, was formally opened on the 21st inst. by the Marquis of Bute. Mr. J. Russell Thomson was the Architect.

**SEAFORTH.**—The memorial reredos recently erected in St. Thomas's Church, Seaforth, was unveiled by Mr. Walter H. Wilson. The reredos has been erected at a cost of £300. This latest addition to the Church is an excellent specimen of Church Architectural work. The designer was Mr. C. E. Deacon, and the carvers Messrs. Earp and Hobbs, of London. The reredos is composed of Derbyshire alabaster, and measures in height 13ft. by 9ft. 6in. in width. The centre position is occupied by a representation of the Crucifixion, and separated from this on each side by a wide panel are representations of Christ as the Good Shepherd and as the Light of the World.

**WALSALL.**—Mr. Rienzi Walton recently held an inquiry, on behalf of the Local Government Board, at Walsall, with respect to an application by the Town Council to borrow £6000 to purchase a site for municipal buildings. The Town Clerk said the present Guildhall had been erected in 1866, at a cost of £6660, the whole of which had now been repaid. In 1877 the Corporation acquired from the Birmingham Gas Company its plant, which was within the borough, and included their offices in Bridge Street. In these offices the Corporation had to crowd the whole of their official staff. The accommodation was utterly inadequate. The site that the Corporation proposed to purchase contained 4308 square yards, and was close to the County Court in Lichfield Street, one of the best positions in the town.

**WOLSHINGHAM.**—On Saturday last the Parish Church of Wolsingham was consecrated by the Bishop of Durham after renovation and improvements which have been in progress for several months. A new altar and pulpit of oak have been provided, and the nave has been re-seated with oak benches. The floor of the nave, formerly flagged in stone, has been laid with blocks of wood; an efficient heating apparatus of hot water has been introduced; and a baptistery built near the south porch, which secures a number of additional sittings, these being very much needed. The new woodwork is throughout of seasoned Hungarian oak, supplied by Mr. W. Hudson, of Bishop Auckland, from designs by Mr. C. H. Fowler, Architect, of Durham; Mr. Westgarth, of Wolsingham, has executed the masons' work; and the heating apparatus is from Messrs. Dinning and Cooke, of Newcastle. The total cost is between £700 and £800. The chancel was adorned with a marble floor and oak stalls for the clergy and choir two years ago, at a cost of £200.

**BROUGHTY FERRY.** Police Commission has resolved to extend the storage capacity of the gasworks, and to apply for additional borrowing powers to the extent of £15,000. A number of other alterations and improvements are contemplated.

**MR. GEORGE FLETCHER**, head of the Masson Ironworks, Derby, died last week from internal hemorrhage. The deceased gentleman was an engineer, and long enjoyed great distinction as the manufacturer of machinery used on the sugar plantations in the West Indies.

Our Glasgow correspondent states that the Clyde Shipbuilders' Federation will join the Engineering Employers' Federation in resisting on the Clyde the eight hours' movement. The masters are fully prepared for a struggle, urging that a forty-eight hours week would represent a reduction of the working of machines by 12 per cent.

A BILL to confirm a Provisional Order of the Local Government Board, enabling the Corporation of Worcester to compulsorily purchase land for the purpose of widening, opening, enlarging, and otherwise improving the street called the Foregate, has passed the House of Commons Committee stage preparatory to being read a third time.

## Enquiry Department.

### SANITARY INSPECTORS' EXAMINATIONS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will you kindly say in your Enquiry Department what is the character of the exams. for a sanitary inspector's certificate, and also where the exams. take place, and when; and the best way for a provincial to qualify for same, and oblige yours truly,

L. E.

Stoke-upon-Trent, June 21st, 1897.

The character of the sanitary inspectors' exams. is with a view to test the knowledge of the candidate in the general principles of modern sanitation. He is required to write and read well, and have a fair knowledge of arithmetic, including mensuration of solids and superficies. He must also be conversant with Public Health Law, and, although not absolutely essential, should have a knowledge of practical building and construction in some particular branch. There are other matters of detail which one can ascertain from the syllabus issued by the Sanitary Institute, Parkes' Museum, Margaret Street, W. (E. White Wallis, Secretary, to whom letters should be addressed). The examinations are held in London and provinces three or four times a year. The best way to qualify, is to pay a coach a fee to prepare you for the exam.—Ed.

### A STUDENTS' COLUMN.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—As a beginner (i.e., a student) in the profession of Architect and Surveyor, might I suggest that you should open a Students' Column in your admirable paper, containing principally matters of interest and instruction to beginners such as myself? I feel sure that such an innovation would be hailed with delight by the student readers of your paper.—I have the honour to remain, yours truly,

WHITE ROSE.

The question of a Students' Column is under consideration at the present time.—Ed.

### "ANCHOR" CEMENT.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—We shall feel much obliged if you can kindly inform us who are the manufacturers of the "Anchor" brand Cement? Thanking you in anticipation of your reply, we are, dear sir, yours truly,

J. T. & CO.

The makers of the "Anchor" brand of Portland Cement are Messrs. Hilton, Anderson, Brooks and Co., of Upper Thames Street, E.C.—Ed.

THE Bishop of London has laid the foundation-stone of the new Parish Church of Emmanuel, West End, Hampstead.

THE organ in the Wesleyan Chapel, Stourbridge, which has been rebuilt by Messrs. Norman Brothers and Beard, London and Norwich, has been recently opened.

THE Queen has just placed a brass tablet in the private chapel at Windsor Castle as a memorial of Sir Henry Ponsonby. It was designed by Mr. Nutt, surveyor to the Dean and Chapter of Windsor.

AT Blantyre Village, where David Livingstone, the African missionary and explorer, was born, there has just been unveiled a memorial tablet, erected in the gable of the tenement there which was Livingstone's home. Messrs. Galbraith and Winton, Glasgow, were the contractors.

MR. JOHN ORD HASTED, R.E., held an inquiry at the Leeds Town Hall recently on behalf of the Local Government Board relative to an application from the Leeds Corporation to borrow £60,000 for works connected with the relaying of the pavement in the streets lying between Kirkstall and Roundhay. The Corporation is asking that the repayment of the money shall extend over a period of thirty years.

## Trade and Craft.

### HEAVY CLAIM BY A CONTRACTOR.

In the Queen's Bench Division Mr. J. H. Campbell applied on behalf of the plaintiff, Mr. John Good, contractor, for an order that the defendants, the Corporation of Dublin, should make further discovery of documents. The action is brought to recover £2469, alleged to be due on a contract entered into with the defendants for the repair of the Green Street Courthouse. The original contract was for £2090, but it contained a clause by which Mr. Good was to carry out any variations or additions to the original plans required by the City Architect and be paid the expenses connected therewith, after it had been ascertained by a fair and equitable survey. The plaintiff claimed £2629 in respect of these variations and additions, bringing the total amount up to £4719 14s. 5d. He had received £2250, and claimed the balance. The Corporation had paid £9000 into Court. The plaintiff had already obtained an order for discovery, but alleged that it had only been partially complied with, certain documents being withheld on the plea of privilege.—The Court granted the application.

### IMPROVEMENTS AT TORRY.

WITHIN recent months very considerable improvements have been carried out at Torry. The important contract of causewaying the Rosemount Viaduct has been completed—Mr. Tawse contractor—and that thoroughfare has now been made one of the best paved streets in the city. From the junction with School-hill to Skene Street the Viaduct has been laid with 4in. cubes on cement concrete, and run up with pitch in the usual way. From Skene Street upward to the junction with Mount Street it is laid with 6 by 4 setts, laid similarly to the nether portion. The spur road leading round from the Viaduct to Union Terrace has been laid with pink (Corrennie) setts. The operations have mainly been directed to certain streets on the south side of Victoria Bridge, where building is actively going on. Victoria Road has now been causewayed from the Bridge up to and including the crossings at Menzies Road. The contractor for Victoria Road, who has completed his work, was Mr. James Leith. The work is well advanced with the macadamising of the adjoining Menzies Road. Mr. Tawse is the contractor.

### ELECTRIC TRACTION AT LEEDS.

The task of applying electricity to the working of the Leeds tramcars has advanced so far that it has been found possible to make an experiment with one of the boilers and engines which have been installed at the generating station in the Calls in the centre of the city. The experiment proved to be very successful. At present only one of the two engines has been installed, but the other is to be fixed up in a few days. The engines have been erected by Messrs. Fowler and Co., of the Steam Plough Works, Leeds. They are of 400 horse power each, and one of them, it is said, is equal to the work to be done, but it is deemed advisable to have a second engine, and this will also be in readiness before next Bank Holiday in August—the date fixed for their completion. It is pleasing to find that so much of the important work in connection with the great change that is being brought about has been skillfully carried out by Leeds firms. While Messrs. Fowler have built the engines, Messrs. Greenwood and Batley have constructed the dynamos. These have already been tested by Professor Hopkinson, the well-known electrical expert, and are ready to be placed in the generating station at any moment. There was at one time some fear that the generating station would not be ready within the specified time, but that fear no longer exists. To expedite the work the engine and boiler have been in course of erection in the station while the ceiling of the station itself was being completed.

### WHO SHOULD MAINTAIN THE SEA-WALL?

In the Court of Appeal an arbitration appeal between the County Council of Kent and the Urban District Council of Sandgate from the judgment of the Divisional Court affirming the award of an arbitrator appointed by the Local Government Board was tried on Friday last. The matters in dispute came before the Court by way of special case, and raised the question whether the District Council of Sandgate or the Kent County Council were liable to pay for the repairs and maintenance of a certain sea-wall known as the Esplanade, and groynes supporting the main road running from Sandgate, past the Marina Villa, up to the bridge over the military canal at Seabrook. The arbitrator awarded that the County Council should pay to the District Council £6000 for its expenses in rebuilding portions of the wall which had been washed away, and erecting necessary groynes. As to another portion, he held that the wall there was not part of the main road, and in respect of an eighth groyne he found to the extent of £1500 in favour of the County Council. From this award the County Council appealed. The Master of the Rolls, in allowing the appeal, said under the Highways Acts it was never intended that the liability imposed on the county to contribute towards the maintenance of "main roads" should include a liability to do so in the case of an esplanade or sea-wall, such as the one which formed the subject of this arbitration. The promenade was built for the benefit of the inhabitants of this watering-place, and as an attraction to visitors, and was not a "highway" for use of the county generally. When the road was made a main road the sea had not encroached to the same extent as now, which rendered the question on whom the liability to repair damage done by storms from time to time a very serious one. In his opinion the local authority had no claim whatever against the County Council or those who happened to be on it, for any contribution towards the expenses that had been incurred in repairs.—Judgment was entered for the County Council with costs.

### DUNDEE MASONS' LABOURERS' WAGES.

A meeting of 'Dundee Masons' Labourers' Union was held last week for the purpose of considering the reply which it was expected would be received from the employers regarding the request made for an increase of half-penny per hour in the operatives wages. Mr. A. Johnston stated that he had received a letter from Mr. W. B. Dickie, Secretary of the Master Builders' Association, to the effect that the employers had not yet had time to meet to consider the claim, but would do so shortly. Mr. Johnston afterwards addressed the meeting, and expressed the hope that their request would be granted, and so avoid any regrettable friction taking place. Their demand should in all fairness be conceded, for it was a just one. While the masons had received three advances, the wages of the labourers had remained stationary.

THE treasurers of the Middlesex Hospital have received from the executors of the late Mr. David Brandon the sum of £10,000, being a payment on account of the residue of his estate, one sixth share of which he had bequeathed to the hospital in addition to a specific bequest of £3000 already received.

In the centre of Bath has just been discovered a fine Roman tessellated pavement 10ft. below the surface. A length of about 6ft. has been laid bare, showing a handsome key border. The dimensions of the whole of it is impossible to estimate without excavation, as it extends under buildings adjoining the old town mansion of the Marquis of Bath.

MR. ORCHARDSON, R.A., has accepted from the Royal Agricultural Society of England a commission to paint a picture of the Queen, the Prince of Wales, the Duke of York, and Prince Edward of York, the three first of whom have held the office of president of the society. The picture will, when completed, be placed in the Council Chamber of the Royal Agricultural Society in Hanover Square.

## SOCIETY MEETINGS.

**Dundee Institute of Architecture, Science, and Art.**—The syllabus of competitions for the session 1897-98 has just been issued. It is as follows:—1. Best freehand sketchbook of Architectural subjects from existing buildings, not less than six pages, in pencil only, not copied from any drawing. 2. Best measured drawings of any Architectural subject, in black and white, and not more than four nor fewer than two sheets, containing plan, elevation, and section to  $\frac{1}{4}$  in. or  $\frac{1}{8}$  in. scale, and detail of a part to  $\frac{1}{16}$ th full size. 3. Best work in modelling or carving of any of the following: (a) Cornice, not exceeding 12 in. by 9 in. by 18 in.; (b) One quarter of centre flower, not exceeding 21 in. by 21 in.; (c) Key stone, not exceeding 18 in. by 12 in.; (d) Lock plate and door handle, not exceeding 21 in. in height. 4. Best outline drawing, from an antique subject in the Dundee Art Museum of casts or from duplicates thereof. Size of work, 22 in. by 14 in., with 4 in. margins

or mounts. 5. Best design in colour for any of the following subjects: (a) Interior decoration of a private library, dining or drawing room; (b) Wall and ceiling paper; (c) Door panel; (d) Tile or parquet floor; (e) Mosaic tympanum. The prize for each competition will be of the value of £2 2s.—At the annual general meeting of the Institute, the principal business was the reception of the annual report and the election of officers for the ensuing session.

**The Architectural Association of Ireland.**—The annual excursion took place recently, Mellifont Abbey and Monasterboice being visited. On arrival at Mellifont Abbey, the party distributed through the remains of this fine old Cistercian abbey; of the Church itself little remains but what suffices to mark the lines of the plan, which is of the usual Cistercian type; but the octagonal baptistry is a building unique in its character in this country; portions of it are in good preservation, the mouldings of its richly-proportioned arcade of round arches being frequently

wonderfully sharp. The detail is of a Transitional type. The chapter-house is in much better condition, and, strange to say, still boasts its vaulted ceiling—not a common thing in Ireland. The detail here is of Early Decorated character, and is very good. A striking thing is that beyond the plan of the Church there is little or nothing left of that type of Architecture generally associated in one's mind with a Cistercian foundation. At Monasterboice the two very fine examples of Celtic crosses were examined with much interest; there are also a few small and quaint tombstones of the last century here. Drogheda, on the return, was reached sufficiently early to give time for a stroll round the historic old town. Amongst the places viewed were the old City Wall, and St. Lawrence Gate, the Constabulary Barracks (an old and rather quaint Georgian building), the new R.C. Church of St. Peter, and the old Abbey.

**Aberdeen Ecclesiological Society.**—The members made an excursion recently to the Church of Arbuthnott. The oldest and

SHANKS & Co., Tubal Works, Barrhead, near Glasgow.

most interesting part of the Church is the choir, or chancel, built and consecrated by Bishop de Bernham in 1242, and restored within recent years by Mr. A. Marshall Mackenzie, A.R.S.A., Architect. The nave of the Church, built in 1485, and the celebrated Arbutnott aisle with the priests' chamber above, built in 1505, with their stone towers, were also much admired.

**Society of Engineers.**—An interesting visit was recently made by the members of the Society of Engineers to the London section of the Manchester, Sheffield, and Lincolnshire Railway Works. The works comprise the Metropolitan division of the Manchester, Sheffield, and Lincolnshire Railway extension to London. The trains of the Company will run from the point where the new main line joins the Metropolitan Railway at Quainton Road, over the rails of the latter Company to Harrow, from which place two new main lines for the exclusive use of the Manchester, Sheffield, and Lincolnshire Railway are being constructed by the Metropolitan Railway Company, adjoining its own line, to a point near Finchley Road station, at which place the work is taken up by the Manchester, Sheffield, and Lincolnshire Railway, and is the property of that Company. From Finchley Road station the new line runs southerly by means of covered way, 26ft. 4in. in width, and at some points quite close to the existing line of the Metropolitan, until it reaches the London and North-Western Railway, which is crossed between the Loudoun Road station and the westerly mouth of the Primrose Hill tunnel by a steel girder bridge of three spans, and then runs into covered way again at the northerly side of the Alexandra Road, continuing either in covered way or tunnel until it emerges into a large opening lying between Circus Road and Wellington Place. It again passes by means of covered way, constructed with three arches, one of 40ft. and the other two of 26ft. 4in. each, the whole accommodating seven lines of rails, under Wellington Place, Lord's Cricket Ground, and St. John's Wood Road. All the retaining walls, side walls, and arches of the covered way and tunnel are faced with blue brindle brick, and present a solid and massive appearance. The Regent's Canal is crossed by a large steel bridge, the openings for the passenger main lines being spanned by through girders, while that portion for the goods and coal lines has been made a deck bridge, and

covered with Hobson's steel flooring so that rails can be laid, and points and crossings laid in at any part irrespective of the girders. Just after crossing the canal a separate pair of lines diverge and run west to Grove Road, under which they pass to an extensive coal depot which is in course of construction, and which occupies an area of about twenty acres. The goods warehouse, which will be 385ft. in length by 255ft. in width, and have five floors, is situate on the former site of Alpha Road, and between it and a new road to the south of it, which extends from Grove Road to Park Road, and which will cross over all the lines of way leading into the passenger station. This road will be 60ft. in width, and is being paved with hard wood blocks of "Jarrah" timber. Another new road leaves this at right angles near to the new vicarage and schools of St. Paul's Church, which have had to be rebuilt, and runs alongside the site of the new passenger station and to the Marylebone Road. The passenger station, which will have a frontage of 325ft. on what was formerly the south side of Harewood Square, will contain the booking-office, restaurant, and the usual waiting and other rooms on the ground floor, and general offices for the Company on the first floor, will be of red brick. In front of the office there will be a promenade 100ft. in width and extending the whole length of the frontage, and from this promenade access will be had to the departure and arrival platforms, which, for the present, are limited to a width of 158ft. on the easterly side, the rest of the space to the west being reserved for future extensions. The platforms and cab rank, which latter is entered from the bridge over the lines at the north end of the station, will extend to that bridge, and will have a length of 1000ft., but the roofing will at present only extend northwards for half that distance. The spans of the roof will be two of 50ft., one of 40ft., and a temporary span of 18ft., and will be carried on columns and arched lattice spans running north and south.

In the covered way, tunnels, retaining walls already done, strength and massiveness are the principal characteristics, and there has been no superfluous expenditure upon ornamentation. The works are let under contract with the Company to Mr. J. T. Firbank, M.P. Messrs. Sir Douglas and Francis Fox are the Engineers-in-Chief. In front of the station, and between it and the Marylebone Road, the Grand Central Hotel of the Gordon Hotels Company, and to be worked in connection with the railway, is being erected. It will consist of a building occupying a block of land 313ft. from north to south, and 233ft. in average width from east to west. It is being built on four sides of a central quadrangle, which will be roofed over in the manner of several Continental hotels, and will form a handsome front for the station, to which access will be had by two new wide streets, east and west respectively, of the hotel. Colonel Edis is the Architect of the hotel.

## COMPETITIONS.

### TO ARCHITECTS.

The Corporation of Bury invite Architects to submit COMPETITIVE PLANS for an ART GALLERY and PUBLIC LIBRARY, to be erected at the corner of Moss-lane and Manchester-road, at a cost not exceeding £16,000.

Premiums of £75, £50, and £25 will be awarded for the designs adjudged of sufficient merit and placed first, second, and third in order respectively.

The Corporation will be advised by a professional referee in the selection of plans.

The premiated plans will become the property of the Corporation.

Lithographed plan of site and copy of conditions may be obtained on application to J. CARTWRIGHT, M.Inst.C.E., Borough Engineer, Bury, on payment of a deposit of One Guinea, which sum will be returned on receipt of competitive drawings.

Drawings to be deposited at the Corporation Offices, Bank-street, Bury, by AUGUST 31st, 1897.

By order,  
JOHN HASLAM,  
Town Clerk.

### LICHFIELD UNION.

#### TO ARCHITECTS.

The Guardians of the Poor of the Lichfield Union are desirous of CONSULTING a duly qualified ARCHITECT with reference to the proposed Extension of their Union Workhouse, with the view of increasing the accommodation therein.

Gentlemen willing to advise are requested to communicate with the undersigned before FRIDAY, JULY 2nd, giving references, terms, &c.

By order of the Board,  
JOHN DERRY,

Union Offices, Lichfield,  
June 18th, 1897. Clerk.

## AUCTION SALES.

CALLOW LAND, LEAVESDEN ROAD, WATFORD, HERTS.

Five minutes' walk from the Junction Railway Station. Highly important Sale of a Freehold Building Estate, situate in the most rapidly increasing and improving locality in Watford.

MESSRS. HUMBERT, SON, and FLINT are instructed by the owner to SELL by AUCTION, at the Queen's Arms, St. Albans-road, adjoining the land, on WEDNESDAY, JUNE 30th, 1897, at FIVE o'clock precisely, 250 PLOTS of valuable and well-placed FREEHOLD BUILDING LAND, adapted for the erection of the most remunerative class of small villa residences and artisans' dwellings, for which in this district, close to the station, the demand appears unprecedented. The land has important frontages to good roads; is sub-divided into convenient plots with sufficient depth to afford small gardens, and will be sold upon liberal terms as to payment, which may be extended over a term of five years, thus affording the smallest capitalist an opportunity to acquire his own freehold.

Plans and conditions, and further particulars, may be obtained of Messrs. SEDGWICK, TURNER and ODDIE, Solicitors, Watford; or of Messrs. HUMBERT, SON, and FLINT, Land Agents, Watford, Herts, and 11, Serle-street, Lincoln's-inn, London, W.C.

### LONDON PLATE-GLASS INSURANCE CO. LTD.

Head Office: 49, Queen Victoria St., E.C.

Glass of all kinds covered by the Policies of this Company.

MODERATE RATES. PROMPT REPLACEMENTS.

Apply, HEADMASTER,

Cheltenham Grammar School.

### BUILDER'S CLERK WANTED.

One with some experience in a Builder's office, prime cost, abstracting accounts, book-keeping (single entry), and general office routine. Hours 7 to 5.—Letter only, stating age, salary, and reference of last and present employer, SHURMUR, Riverside Works, Clapton.

Jubilee Panel in Red and Buff Terra Cotta, commemorative of the 60th Year of Her Majesty's Reign.

### BROWN & DRAB GLAZED BRICKS.

(Largely used for Hospitals, Schools, &c.)

Illustrated List on Application.

**STANLEY BROS. (LTD.) NUNEATON.**

GLAZED SINKS.

SALT GLAZED BRICKS.

WHITE AND COLOURED ENAMELLED BRICKS.

Blue Bricks, Quarries, Copings, Kerbings, Roofing and Ridge Tiles, Fire Bricks, &c.

**GODWIN'S TILES**  
For PAVEMENTS  
WALLS HEARTHES &c  
AS USED BY THE  
Leading Architects & Builders  
13 Cathedrals, Thousands of Churches, Public Buildings, and Private Residences Paved with these Tiles. Best Quality Only.  
Send for Patterns, Price Lists, and Testimonials to  
**W. GODWIN & SON, LUGGARDINS WORKS, WITHINGTON,**  
Patronised by Royalty. Established 1848. Near HEREFORD.

20,000 yards

FLOOR TILES

in Stock.

Quick Supply!

Best Quality!

Low Price!

ARCHITECT and SURVEYOR'S ASSISTANT WANTED to take charge. Seaside town. Must be good draughtsman, leveller, and surveyor; competent to measure up work and adjust accounts.—First-class, steady, and punctual men only are invited to communicate by letter to JAMES W. MARTIN, Architect, Clacton-on-Sea.

### ARCHITECT'S ASSISTANT WANTED.

Must be well up in perspective, details, and specifications.—Address, with age, experience, and terms, ARCHITECT, 3, Hyde-gardens, Eastbourne.

### DRAUGHTSMAN WANTED in a Surveyor's office.

State age, salary expected, and past experience fully, D. W., Abbott's, Eastcheap, E.C.

### QUANTITY SURVEYOR (experienced and reliable) WANTED, in the North of England.

Address, stating when at liberty, age, experience, references, and salary required, to ARCHITECT, 449, Glossop-road, Sheffield.

## APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

### YOUNG ARCHITECT, A.R.I.B.A.,

DESIRES to ASSIST others

in the

PREPARATION OF DRAWINGS

at his own office.

G. SCORER, 28, Newman-street, W.

### ARCHITECT'S ASSISTANT desires ENGAGEMENT.

Quick and neat draughtsman. Perspective and coloured drawings, tracings, details, &c. Good references.—M., 75, Queen's-road, Finsbury Park.

PATENT

### 'DEXTER' TILE-CUTTING MACHINE.

PRICE £3:3:0

Tile-cutting made easy and expeditious to any required shape for Roofing and Upright Tiling. The Machine will cut Staffordshire, Broseley, Terra Cotta, and Glazed Tiles for fitting irregular places, hearths, &c.

### ALFRED BROWN & Co.,

PATENTEES AND MANUFACTURERS,

81, SMALLBROOK ST., BIRMINGHAM.

Terms and further particulars can be had on application.

## THE PRACTICAL DESIGNING OF IRON AND STEEL ROOFING.\*

(Continued from page lxxi.)

BY ALEXANDER DREW.

NO. VI. OF SERIES.

WHERE the ties are of round section the diameter is made such that the required area is got throughout the length of the bar, the ends being enlarged (and shaped as has just been described) to form convenient connections there; but should a flat section be used, the ends are very seldom smithed or shaped in any way. Thus when the hole or holes required to form the connections are made at the ends, the bar is at this point considerably weakened; and as the required section must be provided at the weakest point in the tie, it necessarily follows that there is an excess of material throughout the body. This in itself would imply a greater cost, but when allowance is made for the great saving in workmanship, due to the use of such a simple form of tie, it is quite likely that the difference in cost between these two sections may turn out to be very slight, or even in favour of the simple form.

As a ready means of comparing the sections of round and flat ties, or of determining the required scantling for either of these forms, Table V. may prove useful. Here various diameters from  $\frac{3}{8}$  in. to  $1\frac{1}{2}$  in. are noted, their areas are given, and the required width of flat bar, of thickness varying from  $\frac{1}{4}$  in. to 1 in., necessary to give the same sectional area, is also indicated. The explanatory note points out the necessary additional width required to ensure the desired section across the bolt or rivet hole, or at the weakest point; the extra  $\frac{1}{8}$  in. added to the diameter of the bolt or rivet is due to the fact that the hole is always made larger than the bolt or rivet by at least  $\frac{1}{8}$  in., and may be even by the full allowance made. In many cases the thickness of the flat tie is determined by the method of attachment at the ends; thus, if the rafter be of T section  $\frac{1}{2}$  in. thick, it will probably be most convenient to use the same thickness of flat tie, and so dispense with packings or setting at the junction plates.

Before briefly considering the question of connections, a word or two may be said regarding the use of bolts or rivets. When the holes are carefully formed, and the rivets properly put in place, they undoubtedly form the best connection; and this is particularly so in cases where a considerable amount of jarring or irregular straining is likely to take place (such as in railway bridges); but roof framework is very seldom subjected to this

condition, so that for practical purposes bolts are likely to prove as efficient as rivets. On the question of cost, it may be stated generally that where a very large amount of riveting is required, it would probably prove as cheap, or maybe cheaper, than bolting; but where the quantity is small, the expense of providing the appliances, and the bringing on to the site of a special squad of riveters, would make the cost of this very heavy. Of course it will be readily understood that should the roof framework be called upon to support shafting in a workshop, this jarring is likely to be present; in which cases rivets,

double portion of the other; or should an eye be placed inside a jaw, and the pin pass through all, on failure taking place the pin will be cut or shorn in two places; here failure occurs by double shearing. As the total section shorn through is equal to the sectional area of the pin multiplied by the number of times it is cut through (as for single or double shear), the safe strength to resist such failure is equal to the area shorn through multiplied by the safe shearing stress.

There is another manner by which yielding may occur, where the surface of the pin, or the connecting plates, is too little to resist the

dia<sup>r</sup> of Bolt +  $\frac{1}{8}$  inch.

or special precaution in the designing of bolt connections is necessary.

A joint, whether bolted or rivetted, may yield in several ways, only two of which it is necessary here to look at. It will be safe to assume that the end of the bar, or the connecting plates themselves, are of sufficient strength, so that any failure will be due to the bolt or rivet itself. If failure takes place by shearing, the two portions of the structure slide over one another, and the pin (that is the bolt or rivet) is shorn, or cut through at right angles to its length. Should the connection be similar to that of one plate placed on top of the other, with a pin passing through both, the failure will be by single shear; but should the one portion of the structure be enclosed within a

pressure to which they are subjected, and where failure occurs by the crushing of the material. Here the bearing area is insufficient. This bearing area is calculated by taking the diameter of the pin, and multiplying this by the thickness, or the depth of the surface against which it acts; this area, multiplied by the safe bearing stress, will of course give the total safe bearing strength. In Table VI. is given the area, shearing strength, and bearing strength for various diameters from  $\frac{3}{8}$  in. to  $1\frac{1}{2}$  in. The shearing strength is calculated on the basis of a maximum safe shearing strength of four tons per square inch, and is given for single shear. Should the joints be arranged such that double shearing must take place, this value will necessarily require to be doubled. The bearing

\* A lecture delivered before the members of the Edinburgh Architectural Association, and exclusively published in the BUILDERS' JOURNAL.

strength given is based on a safe bearing stress of nine tons per square inch, and the values noted in the table are those per  $\frac{1}{2}$  in. in thickness. This will readily allow of the correct strength for any thickness being got at.

The next point which naturally falls to be considered is that of the manner in which the

drawn further in towards the centre, while by turning in the opposite direction the ends are thrust further apart. Such an arrangement is frequently introduced into one or more of the ties in roof trusses, and where the span is large, or where it is very desirable to have a certain amount of adjustment as to the span,

Table VI - SHEARING & BEARING STRENGTHS.

Diag. of Bolt or Rivet	Area (Sq. in.)	Shearing (Single) Tons	Bearing (per $\frac{1}{2}$ in.) Tons	Diag. of Bolt or Rivet	Area (Sq. in.)	Shearing (Single) Tons	Bearing (per $\frac{1}{2}$ in.) Tons
$\frac{3}{8}$	.1104	.44	.42	$\frac{7}{8}$	.6013	2.40	.98
$\frac{1}{2}$	.1503	.60	.49	$\frac{15}{16}$	.6902	2.67	1.05

$\frac{11}{16}$	.3712	1.48	.77	$\frac{3}{8}$	1.484	5.94	1.55
$\frac{3}{4}$	.4417	1.76	.84	$\frac{1}{2}$	1.767	7.07	1.69
$\frac{13}{16}$	.5184	2.07	.91	$\frac{1}{8}$	2.073	8.29	1.83

Note:— The max. safe Shearing Stress is taken at 4 tons per sq. in. of Sectional Area. The Values given are for Single Shear. The max. safe Bearing Stress is taken at 9 tons per sq. in. of Section (diag. x length of Bearing Surface). The values given in Table are per  $\frac{1}{2}$  in. of length of bearing.

several members can be connected together at their meeting points; and here may be met an almost infinite variety, some good, but many bad. Time will only allow of a few examples being illustrated, and very briefly described; but as good and bad forms will be noted, it is hoped that what is here said may prove useful in suggesting other forms, or in enabling the student to separate the good from the bad examples which he is sure to meet with either in his book study or in actual practice.

Fig. 31 indicates several forms of joints, chosen for explanation, and, taking these in succession, we will first consider the connection of one tie with another, as this is the simplest joint that is likely to be met with in practice. In (A) the ties are provided with an eye at their ends, and these are simply placed one on the top of the other, and a bolt passed through. Should the strain be considerable, there will be a great tendency to twist, as the ties are not in the same straight line; but for very small roofs, where the strain is very light, such a simple connection is frequently made use of. In (B) an attempt is made to get rid of this twisting tendency by forming what is generally called a "halving," the eyes being set off from the centre of the rod to enable these latter to come in line when the joint is drawn up; but this is likely to give rise to a weak point at the connection of eye and rod, and thus is not to be recommended where the strain is anything great. In (C) one tie is provided with an eye, and the other with a jaw, and when the one is inserted between the other, a very good symmetrical joint is formed; the only objection to this is the cost of forming the jaw, and the welding introduced. This objection is got rid of in (D), where each end is formed into an eye, and the connection is made by means of two light junction-plates and double bolts. In comparing (C) and (D) the cost is likely to be very much the same, for where a saving is made by the cheaper eye being substituted for the jaw, there is at the same time involved the extra cost of two plates and one bolt; the efficiency of the latter joint, however, is more to be relied on if the eyes be "balled" eyes. (E) shows a screw shackle, or, as it is often termed in America, a "turn-buckle," or "sleeve nut"; and as the two screwed ends are formed with right and left hand threads, corresponding, of course, with these in the shackle, a means of adjustment to a certain extent is also provided by this joint; by turning the shackle in the one direction the two ends are

such is to be recommended; but for most roofs of moderate span this is quite unnecessary, and only adds to the cost.

Turning now to the connection of the rafters at the apex, (F) shows one of the simplest forms of these; for very small spans where the rafters are of (L) section the two bars are simply brought together, and a bolt passed through a hole formed at the end of each; it is generally advisable, except in the very smallest of spans, to provide a small crown-plate as shown; this is introduced between the two rafters, and when connected by the three bolts shown, forms a very satisfactory joint. In (G) is illustrated a cast-iron connection;

points, as will be presently seen) is not, I think, to be recommended, particularly for any large or important structure; the material itself is not always reliable, and it is difficult, and in many cases impossible, to detect serious flaws or weaknesses in the casting; while another risk is present in the ease with which these may be injured or broken during erection, or even afterwards, without this fact being brought to notice, and the part replaced. Thus, the notch into which the rafter drops must be somewhat wider than the thickness of the rafter itself, to allow of its ready insertion, and a comparatively little carelessness on the part of the erector in screwing up the bolt too tight may lead to fracture here; the same thing applies equally to the driving of the cotter into its place, while connecting with the king-rod; and there are not a few workmen who might forget to report such an accident, particularly should he be responsible for it. Again, this necessary slackness of the rafter implies the possibility, in fact the likelihood, of continual movement or rattling taking place during high winds, or such like, and such movements may eventually lead to trouble. The most practical method of connection is that shown at (H), and consists of double crown-plates between which the web of the rafter is set, and fixed by bolts or rivets. The ties which meet at this point can be readily connected either by being provided with jaws so that the junction-plates pass between these, or, better still, being provided with eyes and inserted between the junction-plates; in this latter case, these eyes are very likely to be of considerably greater thickness than the web of the rafter, so that some means must be employed to allow of their insertion in place. The simplest way of doing this is by using packing pieces between the rafter and the plates; but where the span is large, and particularly where a considerable number of trusses is required, the better manner of providing for this is to set or joggle these junction-plates; to do this, these plates are heated and set out at the portions where this extra space is required. This joggling is generally done by means of special cast-iron blocks under a press or steam-hammer. Should the number of trusses be small, the cost of providing these special blocks would considerably increase the price of the framework; but where the number of trusses is large, this same cost being spread

Fig. 31.— JOINTS & CONNECTIONS.

slots are formed at either side, into which the ends of the rafters are dropped and connected by a bolt; while a socket is provided into which the end of the king-rod is passed and fixed by a cotter, as illustrated; the sketch also shows how provision may be readily made for carrying a timber ridge-plate. The use of cast-iron in a case such as this (or at other

over the greater number will show very little increase; thus, where price is a great object, it might be advisable to use packing-plates, even though efficiency thereby might be reduced. Of course the size of these junction-plates, and the number of bolts or rivets used to connect the same to the rafters, will vary with the span.

The connection of rafter with strut, or with strut and tie, has already been hinted at in considering the forms of strut ends (see Fig. 30), and only three forms will be here noted. In (I), the T-strut is brought up to the rafter, is connected to the same by a junction-plate on each side, and over these latter is brought the jaws of the diagonal tie, the connection of these to the rafter being made by a single bolt. A somewhat better form is that shown at (J), where the connection plates are made rather larger, and the tie being formed with an eye at end, is inserted between these latter. The last form, that of (K), shows a more important connection (such as that at the centre of the rafter in the type illustrated at Fig. 26, No. 6); the strut is here shown as of double T section. These are placed over the junction-plates, between which are set the ends of the diagonal ties, and all is connected up as shown. This is not a particularly good form of connection, for packings would be required to give sufficient space for the insertion of the ties, and the struts being brought outside these plates would imply a considerable thickness at this point; it would probably form an improvement if the web of the strut was cut away to a greater extent, and the junction-plates brought over these strut-bars, they being allowed to rest on the rafter. The packings would thus be reduced to short pieces at either side, through which the two outer bolts connecting the plates and rafters together would pass; the plates would in such a case be rivetted to the struts, and thus form a more or less solid end to the same.

Passing now to the lower end of the strut and its connection with the main and inclined ties, the first example chosen (L) is probably one of the most unpractical designs that can well be imagined: this is copied from a practical text-book, and is given here as a warning. The strut is of the form shown at 14, Fig. 30, it is round in section, with the end reduced to form the bolt by which the other members are connected together; the main tie is provided with an elaborate enlargement in the form of an eye bevelled below in the manner shown, while the queen-rod has a clumsy bevel-shaped eye, the end of the strut passing through these two.

Such a joint is extremely difficult and very costly to make, the strains are very likely to give rise to considerable twisting tendency, in which case the rigid nature of the whole joint would prevent any attempt at adjustment, the result being some unknown and maybe unsuspected stress which might prove troublesome. It might be claimed by some that such a joint is ornamental, but I would hesitate to admit this. (M), (N), and (O) show three methods by which the same type of connection may be made. At (M) the main ties are provided with jaws, the queen-rod with an eye, and the strut is drawn as of double flat section and comes outside all. The sectional plan shows these jaws as *lop-sided*, the idea being to keep the two jaws identical and allow the queen-tie to come in the centre, but this arrangement is not good. The better plan would be to make the one tie with a narrow jaw, only sufficiently wide to allow of the queen-tie being inserted in it, and the other with a jaw wide enough to come over this. Besides the trouble of making this *lop-jaw*, it must always be borne in mind that an arrangement such as shown is liable to be erected or put together in the wrong manner by the workman, in which case the two ties would be considerably out of line with one another. (N) shows all ties provided with eyes, the strut is of T section with the table notched off, and all is connected together by two junction-plates as shown; sometimes the queen-tie is formed with a jaw between which the strut passes, thus allowing the whole joint to be formed symmetrically; but such nicety is seldom called for, it being quite sufficient in nearly every case to allow the queen-tie and strut to come alongside each other. (O) shows an arrangement very similar to the latter, but the plates are here larger in size, and separate connections are provided for strut and queen-

(To be continued.)

# THE SANITARY INSPECTORS' CONGRESS.

IN delivering his opening address at the annual congress of the Sanitary Inspectors' Association of Scotland held at Aberdeen, Mr. Kenneth Cameron, the newly-elected president, said the advance of sanitary science implied changes in carrying out work which, he admitted, involved hardships, but for these the sanitary officers were not to blame. Opposition had been experienced in regard to infectious and contagious diseases, but as the work of the sanitary inspector became better understood much of the misunderstanding which existed would disappear. He claimed that the work of the sanitary officer had been a factor in reducing the death rate, and said that the agency of the local authorities in providing open spaces, clearing away unhealthy areas, introducing pure water supplies and drainage, and erecting corporation lodging-houses, had been of good service in advancing public health.—Mr. Wm. Mackenzie, sanitary inspector of Ross and Cromarty, read the first paper, which was entitled, "Notes on the Sanitary Conditions existing in the Outer Hebrides, as exemplified in Lewis." At the outset, he referred to the extreme poverty of the inhabitants of Lewis, of whose miserable primitive dwellings he gave a graphic description. The people, notwithstanding their Radical tendency in politics and the deforcements and deer raids in which they figured, were eminently conservative, kind, and hospitable; they lived in the past, refusing to recognise the times in which they lived, and regarding everything modern with suspicion, as an innovation to be abhorred. In consequence, the greatest difficulty was experienced in carrying out sanitation, with the result that practically

## NOTHING HAD BEEN DONE

in the direction of improvement in this respect since the passing of the Public Health Act. He trusted the Congested Districts Board at present proposed in Parliament would give sufficient power to grapple with the subject, for there was no local body financially strong enough to deal with it.—Mr. Glass, Aberdeen, read a paper on the cleansing of towns and cities. He strongly deprecated the system of allowing the refuse collected on the streets to lie at stances in the hope of getting it sold for manure, as such stances became hotbeds of disease germs. The destructor system, as in use in Glasgow, was unsatisfactory, both in respect of cost and of the fact that it did not destroy all the refuse. Seaboard towns should get rid of the refuse by taking it out to sea. He argued that in Aberdeen they could dispose annually of 45,000 tons in this way for £1500, or only 8d. per ton, which was less than was at present being paid for carting, and very much under the cost of destruction by burning.

## LODGING-HOUSE BYE-LAWS.

A paper on healthy dwellings was read by Mr. Braid, Kirkcaldy; and after luncheon Mr. George Macconnachie, assistant lodging-house inspector, Glasgow, read one on "Common Lodging-houses and their Bye-laws." The question was, he said, whether the modern lodging-houses, as now constructed and supervised, or cheap houses, were the better and safer for that portion of the community who might have lost respect for themselves. In his view the modern, well-managed houses were better for those using them, and for the safety of the general public.—An interesting paper on soil bacteriology and its relation to water supplies was read by Mr. John Hunter, public analyst for Mid-Lothian.—Dr. Beveridge, Aberdeen, gave an interesting contribution on the housing of the working classes.—On the motion of the President, it was unanimously resolved that the congress, believing that the housing of the people in the Outer Hebrides and Western Islands is of the worst possible description and detrimental to their health, respectfully brings the subject before the Secretary for Scotland, in the hope that further investigation and inquiry will lead to adequate financial assistance being provided by the Government on their behalf, without which the congress believed the condition of the people could not be materially improved.

# Surveying and Sanitary Notes.

THE Waterworks Committee of the Leeds Corporation recently visited Eccup, for the purpose of inspecting the puddle trench which is now nearing completion, and a trial hole which is situated between the end of the old trench and the building which is known as The Cottage. It was suggested by Mr. Hill, the consulting engineer, that a trial hole should be made at that point, in order that it might be ascertained whether the strata was of the same nature as had been found in the trench, or whether there was any variation which might necessitate the construction of a wing trench. The trial hole has been made down practically to the bottom level of the puddle trench, and the City and Waterworks Engineer (Mr. Hewson) has reported that the strata is of a satisfactory character, and that there is no necessity for the extension of the puddle-trench by a wing-trench. The contractor expects to have the work completed in about three months.

MESSRS. WARREN AND STUART, engineers for the Linlithgow drainage scheme, and Mr. Stevenson, engineer for the trustees of the late Duke of Hamilton, have just issued their observations on the report by Mr. Armstrong, Professor of Engineering, Edinburgh. Messrs. Warren and Stuart state that they note that Professor Armstrong's verdict is practically against the proposal to carry the sewage of the burgh in an outfall sewer to the tidal waters of the river Avon, and there discharge it below the level of low water mark. This proposal they were most inclined to recommend favourably to the Commissioners' consideration when they reported to them on the various available methods of sewage disposal; and while they regret that Professor Armstrong has taken the view of it expressed in his report, they realise that his decision necessitates the abandonment of the scheme for carrying the sewage to the sea. With regard to the lines upon which future legislation as to river pollution prevention is likely to proceed, that is a matter which is entirely problematical. Mr. Stevenson, in his observations on Professor Armstrong's report, states that he is of opinion that the very name of sewage works, to mention nothing more substantial, is sufficient in itself to depreciate the value of the property in their neighbourhood.

THE Water Department, in its report to the Birmingham City Council, submits its accounts and balance-sheet for the year ended the 31st March, 1897. The water-rents for the year show a total increase of 6.58 per cent. over the amount for the previous year. Deducting this, the percentage of increase attributable to natural growth is found to be 4.85. The cost of pumping shows an increase of £1184. A considerable portion of this is attributable to the fact that the total distribution of water during the year has increased from 5794 to 5971 million gallons. But, after making allowance for this, the cost of pumping proportionate to the water distributed has increased. This is principally due to the increase in consumption of water in the higher levels, for the distribution of which water has to be pumped two and three times over; so that, although the cost of pumping per thousand gallons pumped shows a reduction, the cost per thousand gallons distributed shows a slight increase. This is an element in the administration of the Department which, in the nature of things, will tell with accumulating force so long as the supply is given as at present by a pumping system. The total receipts of the Department on revenue account—£202,059—show an increase of £12,189, while the total charges show a reduction of £467, giving an increase of £12,656 in the amount carried to profit and loss account.

## COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
<b>BUILDINGS—</b>			
July 2	Halifax—Works, Canal Machine Works	Managers	M. Hall, 29, North-gate, Halifax.
" 2	Leeds—Villa Residences, near Roundhay Park	Committee	W. H. and A. Sugden, Cavendish-street, Keighley.
" 2	Penkridge, Staffs.—Scaffolding, Parish Church	Committee	W. O. Rooper, Congreve, Penkridge.
" 2	Llanwenarth Ultra, Mon.—Shed, &c., Pendycas Farm	Corporation	Royal Oak, Blaenavon-road, Llanwenarth Ultra.
" 3	Alnwick—Cottages, Wagon Way-road	Corporation	Clerk of Works, Alnwick Castle, Alnwick.
" 3	East Harsley—Houses	Guardians	T. W. T. Richardson, 57, High-street, Stockton-on-Tees.
" 3	Ripon—Infirmary	Committee	F. H. Hargrave, Architect, Market-place, Ripon.
" 3	London, E.C.—Repair of Church Tower, &c.	Commissioners	Shoreditch Vicarage, Hoxton-square, E.C.
" 5	Enniskillen, Ireland—Town Hall	School Board	W. Cleland, Town Clerk, Enniskillen.
" 5	Luton—School Buildings	Governors	J. E. Brown and Son, Market Hill, Luton.
" 5	Porth, Wales—Class Rooms, &c., County School	Galvanised Iron Company, Limited	J. Rees, Architect, Pentre, Rhondda Valley.
" 5	Blackwall—Walls and Foundations	Urban District Council	Works, Orchard-place, Blackwall.
" 6	Hampton-on-Thames—Fire Station	Town Council	J. Kemp, Council Offices, Hampton-on-Thames.
" 7	Conway—Market Hall, &c.	Corporation	T. B. Farrington, Municipal Offices, Conway.
" 7	Douglas, Isle of Man—Municipal Buildings, &c.	Asylum Committee	T. H. Nesbitt, Town Hall, Douglas, Isle of Man.
" 7	Ipswich—Additions, &c., to Asylum	T. C. Hassell	E. Buckham, Town Hall, Ipswich.
" 7	Walthamstow—House, Higham Hill	County Borough	G. B. Jerram, Bridge-chambers, Hoe-street, Walthamstow.
" 8	Tring—Gate, &c., Wilstone Cemetery	School Board	W. Huckvale, Architect, Tring.
" 9	Brighton—Alterations, Schools	Wiltshire and Dorset Banking Co.	F. J. C. May, Town Hall, Brighton.
" 12	Odiham—Schools	West Ham Town Council	Calson, Farrow, and Nisbett, 45, Jewry-street, Winchester.
" 12	Boscombe—Bank Premises	London County Council	G. M. Silley, 17, Craven-street, Strand, W.C.
" 13	Ilford, Essex—Foundations of Lunatic Asylum	School Board	L. Angell, Town Hall, Stratford, E.
" 13	London, N.—Reconstructing Highgate Archway	Urban District Council	Engineer's Department, Spring-gardens, S.W.
" 15	Barry, Wales—School Works, Palmerstown-road	Provincial Gas Works Limited	W. H. D. Caple, 1, St. John's-square, Cardiff.
" 19	Baslow—Cottages (Twelve)	W. H. Franklin	V. R. Cockerton, Clerk, Baslow.
" 30	Crowborough—Residence, Workshops, &c.	Corporation	The Engineer, at Works, Crowborough.
No date.	Doncaster—Shop Premises	Corporation	Gelder and Kitchen, Architects, 76, Lowgate, Hull.
"	Leeds—Shops and Empire Palace, Briggate	United Methodist Free Church Trustees	P. Matcham, Architect, 9, Warwick-court, E.C.
"	Chesterfield—Alterations, Memorial Hall	G. Hughes	W. H. Wagstaff, 57, Saltergate, Chesterfield.
"	Burnley—Chapel, Old Hall-street	J. Kenyon and Co., Limited	G. E. Bolshaw, Architect, 189, Lord-street, Southport.
"	Clacton-on-Sea—Villa, Thorogood-road		J. W. Martin, Architect, Station-chambers, Clacton.
"	Todmorden—Alterations to "Friendly Inn," Lydgate		C. Parsons, Architect, Burnley.
"	Morecambe—Ten Houses, Kensington-road		A. Gorton, Architect, 10, Morecambe-street, Morecambe.
"	Baldon, Yorks.—House		Walker and Collinson, Architects, Swan-arcade, Bradford.
"	Burnopfield—Alterations to Business Premises		J. W. Routhwaite, Architect, 13, Mosley-street, Newcastle-on-Tyne.
"	Chesterfield—Additions to Stephenson Memorial Hall		W. H. Wagstaff, C.E., 57, Saltergate.
"	Halton, near Leeds—House		P. Robinson, Architect, 72, Albion-street, Leeds.
"	Harefield, Middlesex—House, High-street		F. W. Marchant, Supply Stores, Harefield, Uxbridge.
"	Fordham, Cambs.—Public Hall and Institute		Gordon and Co., Architects, Finsbury House, E.C.
"	Shipley Fields Mills, near Bradford—Loom Works		Mawson and Hudson, Architects, 2, Exchange-buildings.
"	Goldhanger, Essex—Farm Buildings		C. E. Butcher, Architect, 3, Queen-street, Colchester.
<b>ENGINEERING—</b>			
July 5	Castleblaney, Ireland—Steel Footbridge	Great Northern Railway Co. (Ireland)	Company's Engineer-in-Chief, Amiens-street, Dublin.
" 5	Diss, Norfolk—Bridge	Urban District Council	Surveyor, Roydon-road, Diss.
" 5	London, W.—Steel Boiler	Paddington Vestry	G. Weston, Vestry Hall, Harrow-road, Paddington.
" 6	Darlington—Gasholder Tank (143ft. 3in. diameter)	Corporation	Borough Surveyor, Town Hall, Darlington.
" 6	Darlington—Gasholder Tank (140ft. diameter)	Corporation	Borough Surveyor, Town Hall, Darlington.
" 6	Richmond, Surrey—Pump Cases, &c.	Main Drainage Board	W. Fairley, Main Drainage Works, Mortlake, S.W.
" 6	Stowmarket, Suffolk—Pumping Plant	Rural District Council	J. Taylor, Sons, and Crimp, 27, Great George-street, W.
" 6	Swindon—Tanks and Filters	Urban District Council	Shophand and Redman, Newport-street, Swindon.
" 6	London—Enlarging Gas Holders, Mains, &c.	Metropolitan Asylums Board	Norfolk House, Norfolk-street, W.C.
" 7	Hull—Cooking Apparatus	Corporation	A. E. White, Borough Engineer, Town Hall, Hull.
" 7	London, S.W.—Kitchen Fittings, Western Hospital	Asylums Board	A. and C. Harston, 15, Leadenhall-street, E.C.
" 7	London—Hot and Cold Water Supplies, Heating, &c.	Asylums Board	A. H. Tiltman, 6, John-street, Bedford-row, W.C.
" 9	Haslingden—Artificial Filter Beds, &c.	Sewerage Board	H. L. Hinnell, 41, Corporation-street, Manchester.
" 9	South Shields—Boiler and Mountings, Pump, &c.	Corporation	Electrical Engineer, West Holborn, South Shields.
" 10	Wilton, near Lakenheath, Suffolk—Bridge	County Council	T. H. B. Heslop, County Surveyor, Norwich.
Aug. 28	Craiova, Roumania—Water Supply	Municipal Council	Mairie, Craiova, Roumania.
<b>IRON AND STEEL—</b>			
July 5	Belfast—Gully Traps, &c. (15 tons)	Harbour Commissioners	G. F. L. Giles, Harbour Engineer, Belfast.
" 5	Canterbury—Fencing, Gates, and Fittings	Town Council	A. H. Campbell, 28, St. Margaret's-street, Canterbury.
" 13	Oldham—Ironwork, &c.	Waterworks Committee	G. H. Hill and Sons, 3, Victoria-street, Westminster.
<b>PAINTING—</b>			
July 3	Wombwell, Yorks.—Painting, &c., Schools	School Board	Offices of the Board, Wombwell.
" 5	Hayton, near Maryport.—Painting, &c., Church	South Metropolitan District School	Rector and Churchwardens, Hayton, Maryport.
" 5	Witham—Painting	St. George's Guardians	Superintendent at School, Witham.
" 7	London, S.E.—Painting, Whitewashing, &c.		C. E. Vaughan, 25, Lowther-arcade, Strand, W.C.
<b>ROADS—</b>			
July 2	Carnforth—Street Works	Urban District Council	J. Atkinson, Surveyor, Carnforth.
" 2	Chesham—Road Works	Urban District Council	A. H. Forbes, Surveyor, Blucher-street, Chesham.
" 2	East Molesey—Making-up	Urban District Council	J. Stevenson, Council Offices, East Molesey.
" 3	Sevenoaks—Street Works	Urban District Council	J. Mann, Surveyor to the Council, Sevenoaks.
" 5	Chingford, Essex—Granite (500 tons)	Urban District Council	H. Bird, Council Offices, 14, The Parade, Chingford.
" 5	Consett, Durham—Kerbing, Channelling, &c.	Urban District Council	W. Ripon, Surveyor, Parliament-street, Consett.
" 5	London, W.C.—Materials	St. Martin's-in-the-Fields Vestry	C. Mason, Surveyor to the Vestry, London, W.C.
" 5	Teddington—Reconstruction of Church-road, &c.	Urban District Council	M. Hainsworth, Surveyor, Elmfield House, Teddington.
" 6	London, E.C.—Wood Paving (4500 superficial yards)	Shoreditch Vestry	J. E. Dixon, Surveyor, Town Hall, Old-street, E.C.
" 6	Middlewich—Macadam, &c.	Urban District Council	R. T. Worth, Town Hall-chambers, Middlewich.
" 6	Reigate—Materials, &c.	Urban District Council	Borough Surveyor, Market Hall, Redhill, Surrey.
" 6	Staines—Materials (400 tons granite, 1000 tons Flint)	Urban District Council	E. J. Barrett, Surveyor, Town Hall, Staines.
" 7	London, S.W.—Asphalte and Wood Paving	Westminster Vestry	G. E. W. Wheeler, Town Hall, Caxton-street, S.W.
" 13	Dover—Granite Spalls (150 tons)	Guardians	E. Carder, Clerk, Union Offices, Dover.
<b>SANITARY—</b>			
July 2	Brighton—Supply of Drain Pipes, 1 year	Council	F. J. C. May, Town Hall, Brighton.
" 2	Durham—Sewers (232 lineal yards)	Rural District Council	G. Gregson, 43, Western-hill, Durham.
" 5	St. Albans—Scavenging	Rural District Council	R. W. Brabant, Clerk, St. Albans.
" 12	Beckenham—Sewer (925 lineal feet)	Urban District Council	J. A. Angell, District Council, Beckenham.
" 12	Holyhead—Sewerage Works	Urban District Council	J. L. Griffith, Clerk, Stanley House, Holyhead.
" 13	Norwich—Sewerage Works	Corporation	A. E. Collings, Guildhall, Norwich.

## COMPETITIONS.

DATE DESIGNS TO BE SENT IN.	DESIGNS REQUIRED.	AMOUNT OF PREMIUM.	BY WHOM ADVERTISED.
July 20	Howth—Presbyterian Church	£20 (merged £10)	Rev. J. Wilson, 4, Rhoda-villas, Howth, Co. Dublin.
" 21	Rugby.—Plans for Municipal Buildings	30, 20 guineas	Urban District Council.
" 31	Bootle—Designs for Technical School	50, 30, 20 guineas	Corporation.
August 31	Bury, Lancs.—Plans for Art Gallery and Public Library	£75, £50, £25	Corporation.
No date.	Boscombe, Bournemouth—Plans for Hospital Enlargement.		Building Committee.
"	London, N.—Competitive Designs for Offices		Tottenham School Board.
"	Huddersfield—Design for Victoria Tower	£21	Tower Committee.
"	Darlington—Altering, &c., the High Row	£20	Corporation.
1898			
Jan. 30	Carlton, Victoria—Children's Hospital	£100, £50, £25	Hospital Governors, Pelham-street, Carlton, Australia.

### A Professional Custom.

THE practice of advertising, by professional men, has always been considered undignified and opposed to their best interests. This seems to be understood equally by all professions, some of which impose a restriction on their members in this respect. In the Architectural profession, though the same unwritten law obtains, it does not seem to be enforced with the same stringency. It is by no means an uncommon sight to see on a hoarding a large board notifying that "this magnificent hotel, the largest in Europe, is being built from designs by Mr. Blank, F.R.I.B.A."; or, perhaps, an announcement to the effect that "particulars of commodious and well-lighted offices, to be erected on this site, may be obtained by application to Mr. Dash, A.R.I.B.A." In these days of keen competition, when every man feels obliged to keep himself in evidence if he wants to live, laws against direct and open advertisement lead to a great deal that is cloaked and indirect, but which is probably more undignified and more harmful, both to the advertisers individually, and to the Profession generally. How much time and ingenuity do we not see devoted to this purpose, time necessarily taken from the study, or legitimate practice, of Architecture! Self-advertisement of any description must always be an undignified proceeding, and opposed to the inclinations of any self-respecting man, and we entirely agree with the prevailing sentiment against it. We could wish, however, that the law was kept more in the spirit than in the letter, as we think that the keeping of the letter of the law for the sake of appearances, while the spirit of it is ignored, is an hypocrisy that is fatal to the self-respect of any man. What is so much to be deplored, is the necessity that is felt by all who have not the good fortune to have work thrust in their way, to go out and spend time and energy in finding it. This involves much that does not tend to raise the credit of the Profession. We must say that we think it would be altogether more simple and more dignified to advertise openly and directly in the Press or elsewhere (which could be done without any loss of time or self-respect), rather than to be "hail fellow, well met," with every man who happened to have money or influence, simply for what can be made out of him, and to be continually on the look-out for a chance of pushing oneself to the front. This state of mind is not natural to the Artist, and is detrimental to his character and his work. In the commercial world things are different. There a man advertises his goods not himself. Personally he may be the most retiring of men. In the Art world, however, it is difficult to separate the man from his work; it is only by advertising himself that he can advertise his work, whereas rightly his work should advertise him, and does, although it is not the rule, unfortunately, as some isolated and brilliant exceptions prove. The present system of indirect advertisement tends too much also to prevent the friendless beginner from making a start; not having done anything he cannot advertise it; but to the man who has already got a start it gives every facility for improving the same. The man who is most in need of advertisement cannot get it, while the man who does not want it has it in abundance. The very

men who by the constant practice of this insidious method have attained to good positions, are the first to pillory any unfortunate beginner who is rash enough to resort to open advertisement. To the genuine Artist any advertisement is disagreeable. The more a man knows the less inclined he is to say that he knows; but, at the same time, great knowledge and consummate ability are of no value to society unless their possessor is in a position to make use of them. No man likes to feel that he is wasted. We are aware that a system of direct advertisement is open to grave abuses, but we doubt whether the scandal to the Profession would be greater

the Board, and represents an angel of knowledge in the act of sheltering a boy and girl. It is a beautiful piece of carving, and the central figure in the group stands about 8ft. high. The arms of the city are carved over the principal doorway, and immediately below the civic device are the words, "Liverpool School Board Offices." The carving on the stones over and under the windows is of Renaissance character. Mr. Charles E. Deacon, of Central Buildings, North John Street, is the Architect. The offices, to which a good deal has yet to be done internally, are situated between Sir Thomas Street and Cumberland Street, with buildings abutting against the two sides. It has therefore, we learn, been necessary to resort to internal areas in lieu of

PATIO DE LOS ARRAGANES, WITH TORRE DI COMARES IN BACKGROUND. SKETCH BY A. N. PRENTICE.

than at present. All self-advertisement is to be condemned, but, if we must have it, let us have it open, straightforward, and direct, with no cant or humbug about it. An open evil is never so dangerous as a hidden one, though it may look more unsightly.

### Liverpool School Board Offices.

THE Liverpool School Board Office Building in Sir Thomas Street—which, viewed from the street, appears to be nearly completed—will afford ample accommodation for the committees and officials of the Board. The carving in the front of the building is of an attractive character, the group of figures in the central gable being particularly noticeable. It is designed from the seal of

the possibility of any side light. On the ground floor, with an entrance from Cumberland Street, will be the male and female visitors' department, rooms for interviews, storekeepers' office and out-door pay office, and they will be arranged round a large waiting-room in the central area. On the first floor, surrounding the main staircase and area, will be situated the principal offices, the entrance for which will be in Sir Thomas Street. The board room will be on the second floor; and close by, on the same landing, there will be two committee rooms, with ante rooms and retiring rooms for the use of members. The next floor will be occupied with a conference chamber and retiring rooms for lady members, whilst on the top floor will be situated the examination room and library. The

caretaker's room will be found at the back part on the second landing, and lavatories for the use of the various departments have been built in several places in the establishment. The building in Sir Thomas Street has been faced with Cefu stone, and the construction is fireproof throughout. The central staircase is being constructionally carried up with the building in arched form, of Hopton Wood stone, quarried and dressed by Messrs. Killer, of Middleton-by-Wirksworth. The contractors are Messrs. Thornton and Sons, of Liverpool.

#### EXHIBITION AT THE MUNICIPAL SCHOOL, BIRMINGHAM.

IN the Examination Hall of the Municipal Technical School, Suffolk Street, an Exhibition of students' work was recently opened by the Lord Mayor. The object of the Exhibition, which is the first held in connection with the school, is to demonstrate what is being done by the establishment, more particularly in its workshop departments. Hitherto there has been only an evening school, attended by young workmen learning their trade, and also by some artisans of fairly advanced years, who find that even they are able to increase their skill by the acquisition of more scientific methods in some matters than those they have hitherto followed. The majority, however, are inexperienced learners, spending only a limited number of hours in the workshops, and the exhibition has chiefly to be judged in the light of this circumstance. One cannot, however, fail to be struck by the highly practical character of the instruction and its suitability to impart, not so much a handicraft as the right use of tools and the knowledge of processes. The exhibits are arranged in ten departments, of which one is composed of mechanical drawing, the others being all

##### WORKSHOP EXAMPLES.

First among them is a large stage of work from the plumbers' shop, with specimens ranging from the most simple folding and beating up of sheet-lead gutters, to cistern-plumbing, lead-pipe working, the construction of rain-water pipeheads, with burnt seams, and the working up of sheet-lead to cover a wooden roof finial. The classes in electro-metallurgy and metal colouring make an attractive display of articles in brass, cast-iron, electrotypes, and tinplate, which have undergone decorative processes of electro-deposition or chemical treatment to produce rich bronze effects. This is a department likely to be useful in various industries, and appears to have been carried on with marked success. As we have now arrived at the age of electricity, it is only what might be expected that the electrical-instrument shop and the electrical-jointing shop should take a

##### PROMINENT POSITION.

From the one some neatly-constructed instruments and parts are shown, while from the jointing shop examples of practically all kinds of jointing and splicing of strips, wires, and cables used as electrical conductors may be seen. From the carpentry shop the examples are almost wholly of structural or builders' work, from a small door to an elaborate roof work or a most difficult circular-headed window top upon a circular plan. The classes in pattern-making also produce a good show of neatly built patterns for engineers' and other castings. In the iron and steel shop most of the examples are elementary practice in chipping, filing, with the use of the scribing block, but there is also more advanced work and a number of parts of a lathe which is being made in the shop. The brass shop is doing excellent work in teaching the method of working brass. In sheet-metal work a great variety of examples are shown, and in each case the article is made, not haphazard, but from a scientific drawing to scale, the quality and finish of the work being admirable. The machine drawing and drawings for building construction are also good. In September it is proposed to have day classes in addition to those held in the evening.

## Views and Reviews.

### FIRES AND PUBLIC ENTERTAINMENTS.

The awful catastrophe in the Rue Jean Goujon, Paris, is an event which has appealed to the imagination of the dullest, and which has had the effect of calling attention to the extremely bad arrangements in many of the buildings devoted to the purposes of public entertainment. Mr. Edwin O. Sachs, who is bringing out an exhaustive treatise on theatres, has collected statistics of the fires which have occurred in them; and not only in theatres, but in music-halls, circuses, and such-like buildings. This information he has thought advisable to publish at the present time, with the expressed intention of strengthening the hands of those interested in the improvement of structures in which entertainments are given. He provides a complete list of fires which have occurred during the past hundred years, of which the details are reliable, and also a further list of many which have occurred as far back as the sixteenth century. These statistics are arranged in several suggestive ways, which enable us to draw various interesting inferences. Thus we see by one table, giving the ages of the buildings when burnt, that by far the greater number are destroyed in the first few years of their existence, and that the number decreases as the age increases; so that the life of a building is something like that of a man, the greatest mortality occurring in early youth. Mr. Sachs, by-the-by, gives the average life of this class of building as about twelve years, which is less than we would have expected. Another table shows the causes of the different fires, and proves beyond all doubt that by far the greater number originate on the stage or its accessories; and that of these the greater number are caused by open lights, and defective gas and heating apparatus. Again, we see that directly after the performance is the most dangerous time, most fires occurring at night, and diminishing in frequency during the day till the preparation for the next performance. Such facts as these cannot but be helpful to all engaged in the management of places of public entertainment, showing them when and where the greatest danger occurs. The author, in his preface, draws attention to what he calls the anomaly of the curious indifference on the part of communities to the danger arising from such catastrophes as fire and panic, compared with the attention given to that arising from disease. The indifference of mankind to certain forms of danger is a commonplace of criticism. The inhabitants of Pompeii furnished an historic instance. In certain parts of Central America, as is pointed out by R. L. Stevenson, the inhabitants live in comfort in a region that may at any moment be devastated. What security have many of the mountain villages of Switzerland from destruction by avalanche? Yet the inhabitants are no less lighthearted. How many rivers in the East but periodically overflow their banks, carrying whole villages away with them after each flood. Those of the inhabitants who escape, return and settle down in the same spot, and wait complacently for the next. In this particular instance of danger from fire, how many of us go to bed at night with any clear idea of how we should escape if fire attacked the staircase? The fact is humanity still seems to class fire with storm and earthquake, as something beyond human forethought and control. If it happens, it happens, but the chances are that it will not; and if it does, that we shall not be in it; so why worry about it? But beyond this, there is a difference to the imagination of most men, between death by accident and death by disease. To be overwhelmed by a flood, or by such a catastrophe as the Paris fire, is terrible enough; but to be distorted by cholera or plague, or to be eaten to death by inches by leprosy or other loathsome horrors, is not only terrible, but disgusting and degrading to the dignity of human life. This may, perhaps, partly explain our zeal for sanitary reform—

now that disease has been struck from the list of what the lawyers so piously term, "acts of God"—and our comparative indifference to danger from fire. It should not be forgotten, also, that in most cases of fire, the principal loss of life is due to the consequent panic, and we all flatter ourselves we should not be the first to lose our heads. Although we may minimise the chance of fire, and provide sufficient exit for people who retain their presence of mind and walk quietly out, yet nothing we can do will be of any avail in a case of panic, unless the building is nothing but exits, that is, has no walls, and is not a building at all. Even then the people would crush one another to death over the seats. In preventing fires we certainly help to prevent panic, and it is the bounden duty of all those engaged in the erection or control of our places of public entertainment to do all that reason can suggest, or skill accomplish, to minimise this awful danger; though we think they can hardly look for an enthusiastic support from the public. A people that deliberately and continually rides in hansom cabs is not likely to concern itself much with the dangers of attending the theatres.

"Fires and Public Entertainments." By Edwin O. Sachs, Architect. London: Charles and Edwin Layton, 56, Farringdon Street, 1897.

### "BEAUTY AND ART."

This handy little volume, by Aldam Heaton, ought to get into the hands of all who take an interest in the very wide subject of which it treats so tersely and comprehensively. Especially does it lay claim to the attention of the Architect. The absence of any recognised standard of the beautiful in Art—of any laws which shall decide what is beautiful and what is not—inevitably results in vagaries of artistic conception. There is a suggestiveness about Mr. Heaton's book which tends distinctly to dispel these vagaries. The treatment of each phase of the subject is so sound and thoughtful that the book becomes at once an important and valuable contribution on the great æsthetic question, the practical solution of which is the great problem of every Artist's life—the beautiful in Art. To absolve the idiosyncrasies of Artists and designers, to induce them to accept tradition rather than moonstruck fancy as their guide, is the object Mr. Heaton has in view, and without a doubt he has set about to accomplish his end very wisely. Mr. Aldam Heaton pays a high tribute to the Architectural profession in general. "The most beautiful and enduring things the world possesses," he says, "we owe to their (Architects') education and their patience, their ingenuity and love; and if a man wants to be transformed and elevated—the beast in him to be subdued and the God-like developed—let him trace the history of Architecture and visit her creations from the Parthenon and the French and English Cathedrals to the Houses of Parliament. If I have any fault to find with Architects, it is that they do not go far enough; that they should not stop at wall and cornice and woodwork, but that they should also design the ceiling, the frieze, the dado, the chimney-piece, the grate, the electric fittings, and not leave all these things to dribble into the hands of a set of uneducated shopkeepers whose only interest is £ s. d."

"Beauty and Art." By Aldam Heaton. London. Gs. Wm. Heineman. 1897.

The extensive premises of the Original Brewery Company at Cheltenham have almost been destroyed by fire, the damage being estimated at over £50,000.

At the Court of Bankruptcy, upon the application of Messrs. Pownall and Co., a receiving order has been made under a petition presented against Messrs. James Brothers, trading as builders at 8, Clifton Street, Finsbury. A receiving order has also been made in the case of John Linn, of Gough Street and Canton Street, Poplar, builder and contractor. The liabilities were estimated at under £1000.

## THOUGHT AND ART IN ANCIENT GREECE.

By D. BENNET DOBSON.

THE earliest traces we have of the inhabitants of Greece are said to be the Pelasgians, descendants from the sons of Japheth, about 2347 B.C. The Pelasgians were ultimately divided into several tribes, of which Hellenes is regarded as one.

Greek civilisation is said to have developed of itself, although some authorities hold that they were influenced by Oriental ideas. At any rate, be what it may, it is the case that it was assisted in its original development by Cecrops of Egypt, to whom is ascribed the founding of the city of Athens.

For the art of writing we are indebted to the Phoenicians.

In the Christian era, Theseus, when he came into power after the deliverance of his country, combined the twelve great States of Greece into one political body, and fixed his headquarters at Athens, making it the capital and the seat of learning, which it continued to be, even up to and during the time of the Romans. He likewise created three classes: nobles, common freemen, and slaves. The nobles possessed both magnificent wealth and power, and owned slaves; the freemen cultivated their own land, and the slaves were treated more like hired servants. It was about this time that the Trojan War occurred, in which all the principal heroes took part, the principal one being Ulysses, who is for ever immortalised by the now famous Trojan horse. In this early period civilisation advanced very rapidly. It is said that even the kings and nobles were not averse (in part it was considered essential to their personal development) to take part in the manual Arts. We likewise find that Art itself, as far as it could be said to be represented, was progressing, as shown by the majestic ruins at the gate of Mycenæ, with the sculptured lions over it. We have also poetry and song represented, Homer standing prominently among all the

minor poets who filled Greece at this time, and he is said to have been an Asiatic Greek. The poetry was characterised by a great poetical unity of the great events that occurred during the Heroic Age, about 850 B.C.

Their original ideas of building were no doubt inspired by timber structures, although none have come down to us. They were also greatly influenced by the numerous ideas imported from Asia, as can be shown by the treasury of Atreus at Mycenæ, which has a vault,

the stones of which are corbelled over one another, and likewise the Oriental influence is shown by the Gate of the Lions, which also forms part of the walls. The rudest and we might almost say the first of the Hellenic works of Greece is well shown by the Old Doric Temple at Corinth, which is about 650 B.C., the period I am now dealing with.

This temple is said to have been originally dedicated to the worship of Athena, the goddess of knowledge and wisdom. As it now remains, it has extremely short stumpy columns and bold mouldings, but essentially presenting the main features of the Doric style in its earliest form.

PORTICO OF THE CARYATIDES.

We now proceed to historical times, when Herodotus was born, 484 B.C. He has been termed by authorities as the "Father of History," as it has truly been said that the Greeks, prior to him, did not really possess a history. He was an energetic traveller, and it is said there was scarcely a city in or around Greece that he did not visit, so that he might be able to speak personally about in his histories. He had vast opportunities presented to him, of which he took full advantage.

Herodotus, although a famous historian, was by no means the only one.

The Greeks had arrived during this period to appreciate to a great extent Art and Learning, so that from this time forward we have temples built to the different deities, and on a much finer basis than the Old Temple at Corinth. During this period the Thesium was built, 465 B.C. It stands on a slight elevation, and is to the left on the road from the Piræus, nearly opposite the areopagus on the right. It is the best preserved of all the ancient buildings of Greece, and might almost be mistaken for a modern structure. The name Thesium appears to have been given it but slightly over 300 years ago by a Jesuit, from the fact that the sculptures on the friezes and metopes were taken as representing the exploits of Hercules, but principally of Theseus. It is said by some authorities to have been dedicated to Mars. It stands upon a marble platform raised two steps from the ground, and is 104ft. long by 45ft. wide.

This is the temple already briefly referred to, which was erected in honour of the hero Theseus for his great deeds during the heroic age. Like the other temples to be shortly mentioned, it is built of Pentelic marble. The Doric columns are 19ft. high, but the statues that originally filled the pediments are entirely lost.

Dodwell says that "this elegant building probably furnished the model for the Parthenon, which resembles it in the most essential points, though it is of nearly double the size."

A most particular point about the temple, which goes a great way to prove that the Greeks selected, certainly with very fine discrimination, Egyptian Art and construction, applying it for their own purpose, is the fact that they employed colour to an elaborate extent on the sculptures of this early temple. Their metopes and friezes were completely subjected to the painter's art, no trust apparently being put in relief, so that the light and shade varying continually gave the appearance of life and motion to the groups.

On the extreme right of the acropolis and temple of Theseus we see a portion of the Hill

TOWER OF THE WINDS ATHENS.

of Mars, then the group of buildings with the Temple of Victory and the Propylaea at the entrance to the acropolis.

The rock which rises up in the great plain was fortified at a very early period. Its defences are ascribed to the Pelasgi. In later days it served a sacred purpose, being dedicated principally to Athena, who was the goddess of Athens.

The acropolis was ornamented with graceful structures either on its summit or around its base, so that in Art as in all other things the Greeks turned everything to account. Its recesses and irregularities were shaped into theatres, monuments, and positions for statues and temples. It is entered at its west end by the Propylaea, and before passing through it by the carriage-way, you pass the temple of Wingless Victory on the right.

As we pass on, the temple of Erechtheus is on our left to the north, with the Parthenon opposite on our right. To the south of the acropolis, beneath the Propylaea, is the theatre of Herodes Atticus, of the Roman period; and further east is the theatre of Dionysus, with the ruins of the temple of Aesculapius, and the stoa of Eumenes between them, also lying at the base of the south wall. All these works of Art were brought about by the policy of Pericles, the great Athenian statesman.

This great leader was born about 493 B.C., and doubtless his early training and the cultivation of his artistic faculties fitted him, in addition to his other admirable qualifications, to take part in later days in the artistic adornment of the city of which he became chief statesman.

Fifteen times he was elected General. He proved his superiority both by land and sea, and, when the subjection of the allied States was complete, the tribute they paid went to the Athenian treasury for the artistic adornment of Athens, to make her the most beautiful city that the world had ever seen.

Everywhere temples, theatres, and porticos began to rise. Phidias, who was the first sculptor of his time, stood well by Pericles. The number of statues, however, that existed could scarcely have been the product of his own chisel; but if different hands were at work, as in the Parthenon, the whole is certainly the expression of his ideas. The Parthenon was built about 438 B.C., upon the south side of the hill of Acropolis. Under Pericles the ground had been raised by a vast superstructure, to make it not only on a level of the surrounding ground but actually above it.

The Parthenon was one of the largest temples of Greece. On the site of the present temple stood a more ancient edifice, begun about 480 B.C. but never completed. This early temple was almost the same width, but about 18ft. longer. The present building was finished about 338 B.C., the Architects being Calliocrates and Ictinus; Phidias being the designer. It was divided into two main divisions, the Hekatompedon and the Parthenon proper; the latter facing the west, and the former the east.

In the Parthenon were four columns, 3ft. in diameter, to support the centre walls, and in the Hekatompedon stood the colossal statue of Athena, 39ft. high, made of gold and ivory upon a framework of wood, by the renowned Phidias. The name, Hekatompedon, is said to have been given it owing to its being used for the ancient temple prior to the present one.

Behind the statue was the Naos, and no communication ever existed between this part of the temple and the maiden's temple. Upon the temple were lavished all the artistic resources of Athens when Art was at its greatest. The decorations of this magnificent edifice were of the richest and most perfect design and execution; sixteen years is said to have been the time occupied in its erection. There are supposed to have been here 1100ft. of sculptures, representing upwards of 600 figures.

Regarding the roof, it is said by some authorities to have been of timber, covered with very transparent tiles, similar to our glass tiles, and as these tiles had a very small star on each, the idea was that the light would shine through and make these stars apparent to the worshippers, with the great statue of Athena standing out in the foreground.

Turning to the Propylaea. It was no doubt found that, having now a treasure, i.e., the Parthenon, it was necessary to guard it, hence the erection of the Propylaea, B.C. 432. The idea of the Propylaea seems to be of Egyptian origin. Propylaea differed from pylae in being complex buildings and having distinct pylae. The breadth of the western ascent was, at its summit, 160ft., and Pericles filled this up with a building which consisted of a grand hall and wings on each side, the hall being 60ft. broad. Through the centre of the building ran a carriage-way about 13ft. broad, paved with slabs of marble, notched, to prevent slipping. The portico front and back were Doric and hexastyle, the interior being supported by Ionic columns.

Some authorities say that Revett was wrong in showing these columns with pedestals. This building is also said to have taken the place of an earlier structure.

After this date the temple of Victory was built, 400 B.C. It is situated immediately to the right of the Propylaea. It is said to have been erected to

TEMPLE OF JUPITOR OLYMPIS.

commemorate the victory of the Greeks over the Persians. It is only 27ft. long and 18ft. wide. Its Architecture and sculptures were of the greatest beauty. It has sometimes been termed the Nike Athena, and has been reconstructed by some German Architects. The discovery of the buried fragments took place in 1835 A.D., by Professor Ross, and it was subsequently re-erected with complete success. The temple is Ionic in character, having a portico of four columns at each front. The frieze that ran round the temple contained about thirty-four figures, and represented an assembly of the gods. The British Museum has at present four of these panels. Later than 1835 A.D. some reliefs were found in the neighbourhood which belonged to the temple; they represented winged victories.

On the north side of the acropolis stood the temple now known as the Erechtheum. Before its erection stood the (supposed) Old Temple of Athena, 527 B.C., south of the present building; and prior to that, i.e., between the Mycenaean periods and beginning of Greek history, stood a still more ancient temple.

The present temple was dedicated to Athena Polias (the guardian deity of the city), and to Pandrosus (the goddess of dew). The name of Erechtheus was likewise connected with it. The date is placed at 393 B.C. According to some recent authorities it was divided into four parts. Facing the north was the tetrastyle portico of Athena Polias (or Minerva Polias), from which entered the Hall to the West Cella. On the east was a hexastyle portico, entering into the temple of Erechtheus the East Cella; this was, by the way, 10ft. lower than the West Cella, and had no communication with it. Lastly, on the south, was the temple of Pandroseium, said by some to be the Cecropeum, the portico of the Caryatides, or the maidens. The whole structure was the most sacred temple on the Acropolis.

It is said that in the beginning Poseidon and Athena (brother and sister) had striven for the possession of Athens, and Poseidon had brought forth a spring of salt water, and that Athena had triumphed by producing an olive tree. Here was also a carved image of olive wood of her, more sacred than the subsequent gold and ivory one. Also within the precincts was supposed to live the serpent which the priests fed, and which was sacred to Athena.

MONUMENT OF LYSIKRATES.

It was strange that Phidias should have displaced it by a rival edifice in the shape of the Parthenon, but the increase of population and the refinement and Art had required a larger and more artistic temple.

The Cecropium to which I have alluded to is said to be the portico of the Caryatides. It is mentioned so by Pausanias in his description of Athens; and that this portico was the tomb of Cecrops, the first king of Attica, and father of Pandrosos, which it is said the acropolis was sometimes called after, i.e. Cecropia. It is also mentioned by some authorities that the Erechtheum was possibly the palace of the Cecropidae. It is about 25ft. long and 12ft. deep, and upon the base 6ft. high were the six maidens Caryatides or Canephoroi.

The figures are of singular beauty, admirably set off by the simple clinging folds of their draperies. As you face them, the second from the left was taken away, and is now in the British Museum, but has been replaced by a terra-cotta one, but some say of marble, executed by a Greek Artist.

The Theatre of Dionysus, where these great representations of tragedies took place during the festivals of Dionysus, is supposed to date back about 340 B.C. It was not rediscovered till 1862 A.D., by H. Strack, a German Architect. It has been very often termed the Theatre of Bacchus, and occupies a large semicircular space in the side of the hill that is immediately under the east end of the south wall of the acropolis. Some of the seats are in good preservation, as well as some of the marble chairs. Before 340 B.C. the theatre was in use, but it was very rude, and no stone was in use in it, simply wood. Dr. Dörpfeld has estimated that 12,000 to 15,000 people could have found room at each performance.

Although the theatre was open to the sky, yet it was possible for temporary awnings to be placed over it. The Greek theatre consisted of three parts: the stage, the orchestra, and auditorium. The width of the orchestra is about 78ft., and from front to back, that is from the stage to the seats, it is about 58ft. A great portion of this is formed into a lozenge-shaped figure. It is formed of Hymettian marble, and, no doubt, formed the place for the chorus. The throne of the Priest of Dionysus was more magnificent than the rest, as becoming the chief priest of the festival, and projected a little farther forward than the other four, and, in addition, had feet carved like the claws of a lion. On the arms is a mythical representation typifying the birth of Dionysus, and also by a youthful winged Niké, stooping towards the Zeus' thunderbolts. Under the abacus are other symbolical figures.

It is said that the men were seated separately from the women. The seats are now very much dilapidated, but most of the remaining ones measure 2ft. 8in. broad and 1ft. 2in. high. The stairs which divide the seats are 28in. broad. The upright slabs round the pit seem to have been placed there during the Roman period, when the Romans introduced gladiatorial combats.

So many monuments came ultimately to be built to the victors in the Pan-Hellenic games, that a street was founded in Athens, called the Street of Tripods. They stood so much in the way that almost the only one that escaped destruction was the Choragic monument to Lysicrates. It owed its security to its having been built in the wall of a convent, where it served the various purposes of oratory, closet, and library.

It dates about 335 B.C., and consists, as you see it now, of a circular marble structure, standing upon a square base 21ft. high and 9ft. in diameter. It is the oldest building extant of the Corinthian order, exquisitely wrought, graceful in its proportion, and rich in decoration, so that the fine-grained Pentelic marble is exhibited to perfection. Each are of a single block, the base of the column, the roof, the shafts of the columns and the circular temple is crowned by a tholus or cupola, terminated with an ornament on which was erected the tripod of bronze. Bronze fishes are said to have been placed between the projecting scrolls of the ornament and that on the

tholus. The temple is formed of six panels, with six columns fitted exactly into the grooves made between them. The capital is of the Greek Corinthian order, a perfect miniature example, but the most perfect we have, and is a work of marvellous beauty.

Turning now to the Tower of the Winds, I cannot do better than give you Vitruvius's description of it—Book I., chap. 6:

He says: "But those who are more curious in these matters reckon eight winds; among such was Andronicus Cyrrhestes, who, to exemplify the theory, built at Athens an octagonal marble tower, on each side of which was sculptured a figure representing the wind blowing from the quarter opposite thereto. On the top of the roof of this tower, a brazen Triton, with a rod in his hand, moved on a pivot and pointed to the figure of the quarter in which the wind lay." The Triton has now vanished. The roof is of black marble blocks, wrought into the forms of tiles. There are two entrances, one facing the north-east and the other the north-west. Each has a portico supported by two columns.

Egeus, though altogether on a different plan; no cement is said to have been used in its construction, the blocks being held together by metal cramps. It presents much the same appearance to-day, and stands as formerly, an isolated gateway 59ft. high, with an archway 20ft. It was this gateway which divided the old Greek city from the new Athens of Hadrian, the inscription on either side saying: "This is Athens the old city of Theseus," and the other, "This is the city of Hadrian and not of Theseus."

This arch is said to have formed the approach of the building I have just described to you, i.e., Jupiter Olympus, which was situated almost due east from the acropolis of Athens.

Without exception, almost all the temples of the Greeks were made of white Pentelic marble, those portions forming the foundations below ground being built of limestone of a hard quality. Black marble, with a bluish tinge, was the material sometimes employed for some special temples or monuments, as in the base of lateral walls of the central hall of the Propylæa, above the base being of a white Pentelic kind. The black came from Eleusis.

TEMPLE OF VICTORY.

The figures typifying the winds are all of colossal size. They are all winged, and they characterise the wind very strongly, whose name they represent. The date of the tower is placed at 159 B.C. The capitals are very remarkable in character. They have been commonly assigned to the Corinthian order, though they are deficient in several of its features. The Corinthian acanthus is represented by a one tier above, that being a series of plain water leaves almost Egyptian in their character.

Of the once magnificent Olympeum building, only sixteen columns remain out of 124. The length of this temple was 359ft., and the breadth 173ft., being thus with one exception the largest on the "dipteral" construction.

The Olympeum was "dipteros decastyles," the columns being of the Corinthian order. The original temple, which this one replaced, was of the most ancient of the Athenian structures. Pisistratus about 530 B.C. projected even then a more magnificent structure, but it was left to Hadrian, 130 A.D., to build this work of Art, "displaying the utmost beauty with perhaps the greatest degree of magnificence and grandeur ever attained by the Architectural exertions of the Emperors of the Roman World." The columns are 6½ft. in diameter and 60ft. high.

The Arch of Hadrian dates about 130 A.D. It is said that it was built on the site of a more ancient building, known as the gate of

Timber was used for the roofs of a large number of temples. The Naos of the Parthenon is said to have been covered with framed timber; their positions, whether of wood or marble, coinciding with the marble beams of the peristyle. The tiles of the Parthenon, and of Greek temples generally, were formed of Parian marble. Its weathering properties were not so good as Pentelic, but it was principally used for its transparent qualities. The door jambs of the Parthenon and other temples were cased with bronze, fixed on a wooden framing. These latter are admirably shown by Mr. R. Elsey Smith in his lecture on Greece in the R.I.B.A. transactions for 1890. He also refers to the unfinished nature of the Propylæa Stylobate, and similarly with the walls, where the joints between the stones regularly gape, the top bed being horizontal, while the lower bed of the stone above is bevelled off, it being the original intention to ultimately leave the finished face some distance back from the present face.

Iron was used in nearly all the temples, cramping the (marble) stones together, and run in with lead. Studs of iron were used to keep the stones in place. Brackets of iron were used in the Parthenon to relieve the cornice from the heavy sculpture. No cementing or binding material of any kind was used in connection with the fixing of the stones, reliance being placed solely in the metal

cramps. They were of a T form, and run in with lead, as I have already mentioned.

Referring now to the lighting of Greek temples, much of what is and has been said is a matter possibly of conjecture. Ferguson, in his excellent work, shows how he would do it, and other authorities do the same. It is contended that it could not be by lamplight alone that the beauty of the interiors could be seen, and as light certainly was not introduced through the side walls, nor could in sufficient quantities pass through the doorways, it is contended by some authorities that only from the roof could it be admitted. At the same time it could not have been by a large horizontal opening in the roof, as that would have admitted the rain and snow, as well as the light. The alternative of Ferguson is that of a clerestory, similar internally to that found in all the great Egyptian temples, but adapted, instead, to a sloping roof; the temple of Eleusis was possibly one of the many on this plan, and it is said that shutters were used with the object of admitting or excluding light in the celebrating of the mysteries.

On the other hand, the great temple of Jupiter Olympius at Athens was lighted from a court or hypæthrum.

Although applied to other temples, the Parthenon has been taken principally into account by authorities.

With the temple as a whole, it is considered unreasonable to suppose that the ancients entirely concealed or even materially altered in appearance the general surfaces of the marble, which they made a point of obtaining wherever possible; but the Athenian sun had such a dazzling effect on fresh Pentelic marble that the artistic value of "toning down" the almost pure white of its polished surface cannot be disputed, and the more so when some portions of the Architecture were painted in positive strong colours. The "tone" produced was as slight as the difference between fresh white polished marble and ivory.

The fret and honeysuckle ornaments were painted on the toema, or architrave band, and guttae tablets respectively. As regards the corona, architrave, and columns, it will probably remain a matter of conjecture how far these were painted in flat colour; there are, however, some slight grounds of evidence that a peculiar yellow tinge, upon some parts of the columns, were not simply the yellow said to result from oxidization of iron in the Pentelic marble, but has been applied externally as a tone, though, perhaps, so delicately as merely to reduce the high light of the marble when new, without greatly obscuring its crystalline lustre. There are but very slight remains (if any) of colour on the sculptures. Some authorities assert that the sculpture had a blue back ground, as on the Panthenaic frieze.

In conclusion I would like to say a few words regarding the efforts being made by different nations to enrich the world of Art by means of excavation and study of Greek Art at Athens. The BUILDERS' JOURNAL gave an excellent article on the subject of British support, in July of 1895. At a meeting of British School under the Presidency of the Prince of Wales, it reported that: "We, who are supposed to be the wealthiest nation of the world, can only afford £500, but France gives her School £3120; Germany give hers £2400, and the American School has an income of £2000 a year. . . . The German Government has spent £40,000 at Olympia, and the French Government £29,000 at Delphi, while our Archaeologists have had the greatest difficulty in collecting a few hundred pounds from friends, for the small but extremely fruitful excavations which they have made on various sites." It passes on to say that unless they are properly supported, the excavations would be abandoned. Surely this is not what should be in a nation such as ours. We have been termed a nation of shopkeepers, but the other nations all know the spirit of enthusiasm which marks even our Art. It is surprising that better facilities are not given for students to go to Athens and see Greek Art in its native atmosphere.

The opening of the new General Hospital at Birmingham has been fixed for July 7th.

#### BABYLONIAN EXPLORATION.\*

IN a recent issue we gave brief particulars of the exploration expedition to Babylonia under the direction of Mr. Haynes, chronicling the success which attended the excavation of the great mounds of Nuffar, the site of the ancient city of Nippur. The following details are not uninteresting:—The great mounds of Nuffar are situated on the east bank of the now dry Shat-en-Nil, a great main artery navigation canal which once connected Babylon with the Persian Gulf. The central feature of the ruins is a vast conical mound—called by the Arabs Bint el Amir, "the Amir's daughter," which rises to a height of nearly 29 metres\* above the surrounding plain. This mound marks the site of the great ziggurat or temple stage tower first built by Ur-Gur, or Ur-Bahu, as he was formerly called—about B.C. 2800, and subsequently repaired and added to by later kings. This vast structure was the central point of the explorations by Mr. Haynes. We have long been familiar with another of the great stage towers erected by Ur-Gur at Mugayyar the ancient Ur; but the one at Nippur is the first that has been thoroughly explored. The tower rests on a basis 59m. by 39m., and is built, like most of these Babylonian towers, with the angles to the cardinal points. It appears to have consisted, like that of Ur, of three stages only, not seven, like the later towers at Babylon and Khorsabad. Each stage had a thick coating of plaster, composed of clay mixed with chopped straw; and

#### TO PROTECT THE LOWER STAGE

from the winter rain it was faced with kiln-burnt bricks and a coating of bitumen. The ascent was on the south-east side, and here it would seem Mr. Haynes has made a most important discovery. Two walls of burnt brick, 3.40m. high, 16.32m. long, and 2m. from each other, were built out into the temple courtyard, and this causeway was filled in with crude bricks, and formed a broad roadway leading up to the tower. The whole temple enclosure is surrounded by a massive wall, of which more than thirty courses are still visible. The arrangement of this temple and tower of Ur-Gur bears a most striking resemblance to the early Egyptian pyramids, especially Medum and the stepped pyramid of Sakkara, while the causeway recalls that of the second pyramid of Khafra, which connects it with the so-called temple of the Sphinx. The question often suggested by archaeologists has been, were these stepped pyramids connected with the

#### TEMPLE TOWERS OF CHALDEA,

or borrowed from them? There is now, however, a possibility of reversing this question, in the light of these discoveries at Nippur. The pyramid, we know, was but an elaboration of the Mastaba, and the resemblance between these and the towers at Ur and Nippur is most striking. Dr. Hilprecht and Mr. Haynes maintain, upon very good grounds, that Ur-Gur was the first to build these ziggurats, and there is certainly no trace of such edifices in any of the older cities, those at Tello or Lagash and Abu Habbah, the ancient Sippara, being both later. At no period in early Chaldean history was there so close a contact between Egypt and Chaldea as during the dynasty of Ur-gur Dungi and Gudea of Lagash. These rulers, as we know from their numerous inscriptions found at Tello by M. de Sarzec, were in constant communication with Egypt by sea and through the Sinaitic peninsula. It was from this region that they obtained the hard diorite and porphyry for their statues and door sockets. The statue of Gudea, seated and holding the plan of a temple on his knees, is

#### MOST EGYPTIAN IN CHARACTER,

the attitude resembling that of statues of Khafra and Menkara; moreover, the scale engraved upon the tablet gives the Egyptian and not Chaldean cubit. Indeed, as Mr. Bos-cawen has pointed out, the statue of Gudea,

the Architect, with the plan on his knees, bears a most striking resemblance to the Egyptian figures of Imhotep, the Egyptian god of mathematics, who may be regarded as another form of "Phtah," the "Architect." In the face of this evidence from Nippur, we may have to reconsider the question of Chaldean influence on Egypt, and, indeed, possibly reverse the old theory. The tower rests upon a massive platform of crude brick. Excavations conducted below this revealed the existence of a second pavement of much finer construction, being built of kiln-burnt bricks of great size—the dimensions being 50cm. square, and of great thickness. Nearly the whole of these bricks were inscribed, and bore the stamps of Sargon I. and Naram-Sin, his son, and its date, therefore, is just a thousand years prior to the buildings of Ur-Gur—namely B.C. 3800. From the inscription of both these kings, we know that they both built large portions of an older temple of Mullil, for the bricks bear the inscription, "builder of the Temple of Mullil," and dedicated a number of vases to the temple inscribed with their legends. These

#### BUILDINGS HAVE BEEN ENTIRELY REMOVED,

and the surface of the vast platform levelled for the reception of the edifices of Ur-Gur. Of the old temple there is evidence afforded by a discovery to which we shall shortly refer. Proof, however, of the great buildings of Sargon and his son is afforded by some excavations to the north-west of the temple. Here was a line of mounds which marked a rampart, and Mr. Haynes in 1895 cleared a portion of it and unearthed one of the most extraordinary pieces of masonry ever discovered. The foundation consisted of a solid bed of clay mixed with straw and puddled down, resembling some of the constructions found by Dr. Schliemann at Hissarlik. Upon this foundation and plinth was constructed a solid brick wall, 52ft. in thickness, and rising to an unknown height. The builder of this wall was Naram-Sin, whom so many have regarded as a mythical king. It is probable that this rampart formed also a broad roadway round the city, and it may possibly, as Mr. Haynes suggests, have had a row of chambers in its upper part. A similar wall, but less than half as thick, was found by M. de Sarzec at Tello. Directly to the south-east of the great tower and close to the great rampart, Mr. Haynes discovered a chamber 11m. long, 3.54m. wide, and 2.60m. high. As there was no doorway, it was evidently

#### A VAULT ENTERED FROM ABOVE.

Its floor rested upon the platform of Naram-Sin, and it formed a communication between the two strata. The inscribed bricks proved it to have been built by Ur-Gur. What was its purpose is explained by the discovery of a second chamber of the same kind immediately below. In this second chamber a brick stamp of Sargon was found imbedded, and broken stamps and some few tablets were found in the room. The explanation is now easy. Round the walls ran a narrow shelf, on which some tablets and brick stamps were found. The chambers were the archive chambers of the temple; the smaller one that of Sargon, which had been partly restored by Ur-Gur, while the second was that of the King, built up to the level of his own pavement. It is clear that at some time between the time of Ur-Gur, B.C. 2800, and the rise of the Kassite dynasty, B.C. 2200, the archive chamber had been broken into and large numbers of objects carried away and the rest broken and scattered. There can be little doubt that this disaster took place during the terrible Elamite invasion in B.C. 2285, when all the principal temples were pillaged and their treasures carried to the Elamite capital. We have a proof of this afforded by a small disc of agate found in the ruins, which bears on one side a dedication by Barnaburyas, B.C. 1400, which states that it was taken from "the palace of Susa in the land of Elam." The amount of debris from the pavement of Naram-Sin to the top of the mound is 11m. in height, and this, we know, took close on 4000 years to accumulate. Mr. Haynes, encouraged by the success of his work in the upper stratum, proceeded to

\* In this article the metric system is used, as by Mr. Haynes and Dr. Hilprecht in their reports.

excavate to reach the virgin soil, which he did at the depth of 9.25m., passing through the debris of ruined buildings, accumulations of broken pottery, and fragments of inscribed stone objects and well-constructed drains. These remains prove the existence of at least two temples below the pavement of Naram-Sin, which at the most rapid rate of debris accumulation cannot be assigned to a later date than between six and seven thousand years before the Christian era. This lowest stratum has been much disturbed, and the buildings pillaged; still, sufficient remains to reveal to us earlier phases of Babylonian civilisation than we have ever seen. The first structure discovered was an altar of sun-dried bricks, 4m. by 2.46m. The upper course had a rim of bitumen, and upon the altar was a large deposit of white ashes. Round the altar was a low wall marking the sacred enclosure. Outside of this enclosure were found two

#### IMMENSE VASES OF TERRA COTTA.

These great specimens of early pottery were each 63.5cm. high, and decorated with rope pattern. We have here in this simple, sacred precinct the germ from which sprang the great temples of Chaldaea—the altar, with its temenos, entered only by the priest, and the two great vases for purification, replaced in after-times by the greater and lesser absu, placed before the temples. A somewhat similar construction was discovered at Sippara, but its archaeological value was not recognised. South-east of the altar was found a remarkable structure—a brick platform, 7m. square and 3.38m. high, built of fine unbaked bricks. Round the base of this Mr. Haynes found a quantity of water vents, which indicated a connection with some receptacle below, and on sinking beneath this solid mass he found a drain passing underneath the platform, in the roof of which was the earliest known keystone arch. It is 71cm. high, and has a span 51cm. The bricks are well baked and joined with stiff clay as mortar. Thus the priority of Chaldaea in the use of the keystone arch is clearly established. This structure was over 7m. below the pavement of Ur-Gur and 4.57 below that of Naram-Sin, and, since there were no massive ziggurats or great temples to crumble into ruin, it must have taken

#### MANY CENTURIES TO BUILD

up so great a mass of debris, and an estimate of from 1500 to 2000 years before the time of Sargon does not seem too high. Having described the strata of this remarkable site, it is now time to devote some consideration to the numerous monuments and inscriptions that have been recovered. The harvest has been an ample one. Over 26,000 tablets, as well as numerous inscribed fragments of vases and stela, have been recovered from this site. It is therefore clear we have no lack of material. It must be remembered, as we have already said, that the record chambers of both Sargon and Ur-Gur were sacked by the Elamite invaders of Kudur-Nakhunte in B.C. 2285, and this will account for so few inscribed records being found in the lowest strata. That, however, there had been numerous records of the pre-Sargon period which had been removed to the treasury of Sargon, and subsequently to that of Ur-Gur, is shown by a most important find. Under a pavement of Ur-Ninip, a king of the dynasty of Ur-Gur, were found quantities—some hundreds—of broken vases and other objects that had been votive offerings to the shrines of Mullil from the earliest times. Among these were some

#### OF THE MOST ARCHAIC TYPE,

even more pictorial than those discovered by M. de Sarzec at Tello. Among these was a large stone boulder inscribed with a linear inscription of a king named Lugal-Kigub-Nidudu. Upon this we find a second endorsement by Sargon, written years after in arrow-headed characters. Here we have a manifest proof of the priority of this monarch to Sargon. Among these broken fragments, purposely destroyed, were the fragments of over a hundred vases dedicated by a king named Lugal-zaggi-si to the temple. From these texts Professor Hilprecht, almost at the loss

of his eyesight, has constructed a complete text of 132 lines written in a most archaic character. Fragments of similar vases were found beneath the Sargonic pavement. The most conclusive proof, however, is afforded by the examination of these inscriptions along with the earliest monuments from Tello, where they are found to form a complete historical series relating to affairs of which no mention is found, either in the time of Sargon or after. All of these records relate to a series of primitive wars, and form certainly, whatever their age may be, the oldest historical records known. The earliest of these is the inscription of "Eshagsagana," written in most archaic characters—this monarch is styled "lord of Kengi," that is, Lower Babylonia,

#### "THE LAND OF CHANNELS AND REEDS."

In his time the chief enemy of Babylonia was the city of Kish, the modern El Hymr, whose priest ruler had entered into alliance with some fierce tribes called "the hosts of the Land of the Bow," a people regarding whom we shall have some remarks to make shortly. The first inscription records a war against them by the Babylonian King. It describes how the Babylonians "conquered the King of Kish and his ally," the evil-hearted "horde of the Land of the Bow," spoiled his city and burned his property, carrying away the statue of the King, his bright silver, and the furniture which he dedicated to Mullil. The next inscription in this sequence is one of the King of "hordes of the Bow," who had had his revenge and conquered Babylonia. This inscription is engraved upon the vases which he dedicated to the temple. It begins by an inscription to Mullil,

#### "THE LORD OF THE WORLD,"

from "Lugal-zaggi-si, King of Erech, the son of Ukus, high priest of the Land of the Bow." Thus we see that the conqueror had established himself in the ancient capital of Erech, and from his inscriptions we learn also that he ruled in Ur-Larsa as well as in Nippur. The King then describes his empire as extending from the Lower Sea of the Tigris and Euphrates to the Upper Sea (Mediterranean), and as being granted dominion over all lands from the rising to the setting of the sun, whom he has caused to dwell in peace. How long this foreign dynasty ruled we do not know; it was, however, followed by a dynasty whose capital was Ur or Mughier. In the inscriptions of Lugal-Kigub-Nidudu, found with the above, we learn that he made Erech "the seat of lordship and Ur the seat of sovereignty." The closing episode of this first of wars is supplied by a monument discovered by M. de Sarzec at Tello, the celebrated

#### STELA OF THE VULTURES

now in the Louvre. In this monument erected by the King of Lagash, when a dynasty of kings was established after that of Ur, we have the record illustrated by sculpture of the King, who made a victorious campaign and utterly defeated the "hordes of the Land of the Bow." After this, neither in the campaigns of Sargon or his son, nor in any chronicles of the Babylonian Empire, have we any record of these people. Who were they, then? Professor Hilprecht has put forward in a most dogmatic manner a theory that they are to be identified with the Semitic tribes of North Mesopotamia, and that the "City of the Bow" was Harran. He cites no ancient authority, no pre-Sargonic mention of Harran, but only a statement of Albiruni "that Harran was built

#### "IN THE FORM OF A CRESCENT MOON,"

and that the plan of the ruins resembled a bow. It is surprising to see so brilliant a scholar using so feeble an argument. It is rather to the plains of Central Mesopotamia and the lowlands between the Tigris and the Kurdish mountains that we must look for the home of these nomadic warriors. There, no doubt, was a variety of tribes among them, but their inscriptions are written in Sumerian, and there is only one word with a suspicion of Semitic origin, and on this no argument can be based. It is enough that through the Sumerian they have restored to us the earliest

chapters of the world's history. Indeed, the style of Professor Hilprecht's otherwise excellent memoir is not such as commends itself to scholars. No doubt he is making known the greatest discoveries of modern times, but there is no need to substitute personal dogmatism for scientific facts. It is waste of time to advance on slender basis theories which have to be corrected in subsequent parts. We have been able to give only a brief account of the wonderful work of this campaign, which reflects so much credit on its organisers, and, above all, on Mr. Haynes. For thirty-two months he lived alone among the wildest Arab tribes in Mesopotamia, in an atmosphere of fever, varied with cholera. One determined, but, fortunately, unsuccessful attempt was made upon his life; yet, amid all these surroundings, he lived, and did the work of three men. It is no over-praise to say that Mr. Haynes is justly entitled to take his place in the front rank of explorers along with those who have restored to us the first chapters of the world's history.

### THE LONDON COUNTY COUNCIL AND THE WORKS DEPARTMENT.

#### THE WORKS COMMITTEE DONE AWAY WITH.

AFTER no less than three adjournments of the debate on four successive afternoons, the London County Council has come to a decision on the much-vexed report of the Special Committee on the Works Department, brought up by Sir Arthur Arnold and signed by a majority of its members. In November last the Council resolved that an inquiry should take place into the alleged falsification of the accounts by officers of that branch. The Committee desired Mr. Edwin Waterhouse to be an assessor, and Mr. C. A. Greening was nominated as his colleague. The total amount of the fabricated entries was reported by these experts to be £7229 11s., but they added, "these entries had no reference to any misappropriation of moneys, nor did they conceal any action whereby any employee of the department was pecuniarily advantaged." The Committee rehearsed the facts in connection with the works carried out, and reviewed the labour of other municipalities and corporations. They also examined many experts who stated the objections entertained by the leading contractors to the conditions of the Council's contracts, which prevented the best of them tendering. They stated as their conclusion: "We regard the employment of contractors as beneficial, if considered only as strengthening the resources of the Council for the undertaking of public works." In conclusion they made the following recommendations, with one addition:—

"We recommend:

"(b) That a Works Board be substituted for the Works Committee, such board to be elected forthwith, one member to be nominated by and from each of the following committees: Finance, Asylums, Bridges, Fire Brigade, Highways, Improvements, Main Drainage, Parks, and Housing of the Working Classes; and that in future years the election of members of the board do take place at the meeting of these committees next to March 31.

"(c) That any committee desiring to propose to the Council the carrying out of any works without the intervention of a contractor shall, in the first instance, obtain an estimate from the proper officer, and then refer such estimate to the Works Board for their consideration before reporting to the Council.

"(d) That the Works manager shall, unless in any case otherwise ordered, carry into execution all works which the Council resolves to execute without the intervention of a contractor.

"(e) That when the Council wishes to execute any works without the intervention of a contractor, the plans, specification, and estimate shall, unless otherwise ordered by the Council, be thereupon referred to the Works manager.

"(f) That the Works manager shall be responsible to the Works Board, and the board shall report from time to time to the Council.

"(g) That this report be referred to the General Purposes Committee, and that it be an instruction to that Committee to amend the standing orders in accordance with the foregoing recommendations.

"(h) That it be referred to the General Purposes Committee to make further amendment of the standing orders by the insertion of words coupling the unions of employers, where such exist, with the trades unions, in reference to the rates of wages and hours of labour.

"(i) That it be referred to the General Purposes Committee to make further amendment of the standing orders by omitting provisions giving powers to the clerk of the Council to direct examination of the books of anyone contracting with the Council for the execution of works, other than the time-sheets or books or wages sheets or books."

The additional paragraph (a) was a general declaration in favour of the direct employment of labour by the Council, and it was on this point that at the meeting before the Jubilee recess the votes were equally divided.

Sir A. Arnold decided that he would accept an amendment standing in the name of Mr. E. White, and after an acrimonious discussion, in which the labour members took a prominent part, it was carried without a division. It ran as follows:

"That all works ordered by the Council to be carried out without the intervention of a contractor shall in future be carried out by the manager of the Works Department, who shall be responsible to the Spending Committee in the same way as a contractor would be; and that the Finance Committee shall have control of the finances of the department."

With some other consequential amendments, the report was then passed. The effect of the change is to abolish the Works Committee, and to place the manager in the shoes of the contractor. He will carry out such orders of the so-called Spending Committees—i.e., Fire Brigade, Bridges, Main Drainage, and Asylums—as the Finance Committee may approve. The Works Department remains, but the Finance Committee will have the supervision of its doings, whilst the manager will have a freer hand than before in the purchase of materials and the organisation of his office. How the system will succeed remains to be proved. It is not entirely new, as at least one large job was executed under such conditions before the Works Committee was established. Meanwhile, as both Moderates and Progressives seemed to accept the modification, it is to be hoped that this part of the Council's duty will be conducted on business lines and by common consent. The view seems to prevail that until after the next election, in March, 1898, no arrangement could be made permanent.

IN Biddenham Church, Bedfordshire, a window has been erected to the memory of the late Charles Howard. The subject of the memorial was one of the best known agriculturalists in the Midlands, and his flock of sheep was famed throughout England. The window is the work of Mr. C. E. Kempe.

ST. JOHN'S CHURCH, Nelson, which has been closed for several months for restoration and enlargement, was re-opened last week. The Church improvements include a new chancel, organ chamber, two vestries, and transept. The total cost is £3000, and towards this £2000 has been raised, including £500 from members of the Walton family.

A FIRE broke out between four and five o'clock on Thursday morning on the premises of Messrs. J. F. and G. Harris, timber merchants, Victoria Wharf Saw Mills, Palmer's Road, Green Street, Bethnal Green. Four buildings used as workshops and saw mills, covering an area measuring about 30yds. by 35yds., were destroyed. A very large stack of timber in the yard was also reduced to ashes, and the stables were also involved in the general ruin.

#### ANTIQUARIAN SCOTLAND.

EDZELL CASTLE and the Round Tower at Brechin were inspected recently by the Aberdeen Philosophical Society, on the occasion of its annual excursion. The ruins of Edzell Castle are notable for a series of sculptures upon the garden wall, which is without a parallel in Scotland, and "remains a silent witness both of the taste of Sir David Lindsay, Lord Edzell, who promoted its execution, and of the skill that could be found in Scotland to carry it out in the beginning of the seventeenth century." So much controversy arose among the inspecting party as to the probable nature of the ornamentation of the garden wall, that it seems advisable to transcribe a portion of a detailed description furnished to an early number of *Scottish Notes and Queries*, by Rev. Dr. Gammack: "The ruins of the old Castle are intensely imposing as they lie in solitude on the northern bank of the West Water. The garden enclosure is entered through an antique porch or summer-house, and the flower-beds of former days are replaced by the green sward. The aspect of the three enclosing walls is exceedingly striking for the elaborateness of their decoration. The garden is 173ft. long by 144ft. wide, but while the Castle wall, on the north side,

#### IS WITHOUT ANY ORNAMENT,

the three other walls of the garden have their faces divided into compartments 10ft. to 11ft. wide, separated by what appear to have been square shafts, with caps, bases, and square bands; the band may have been intended to support a statue as the upper member of the shaft. In every second compartment is the uniform design of three rows of small square recesses, arranged chequerwise to represent the fess chequy of the Lindsay arms, while surmounting these are the three seven-rayed stars of the Stirlings of Glenesk. Alternating with the compartments containing the arms are those bearing the sculptures, and having in each, underneath the sculptured panel, a square plain recess that was perhaps intended for flowers or for a coat of arms. Partly projecting above the wall there is also in each compartment a small niche with a carved cushion on which a bust or other ornament might rest. The three sets of figures on the walls represent Astronomy, the Sciences, and the Virtues, and are evidently tokens of the effect that the Renaissance was having even in Scotland. In the designs there is usually a certain amount of pictorial representation in the background as well as in the principal figures. But it is worthy of note that in the same piece of carving there is traceable the presence of different hands, the upper parts being carefully and skilfully executed, while the lower parts are wanting both in proportion and finish."

#### THE SCULPTURES ON THE EAST WALL

represent—Saturn, Jupiter, Mars, the Sun, Venus, Mercury, and the Moon; on the south wall—Caritas (one of the "virtues," displaced from its proper wall a good many years ago), Rhetorica, Dialectica, Arithmetica, Musica, and Geometria; and on the west wall—Spes, Justitia, Fides, Prudentia, Fortitudo, and Temperantia. From Edzell the party drove to Brechin, passing under the Dalhousie Memorial Arch (erected in 1889 to the memory of the last Earl of Dalhousie and his Countess). At Brechin an inspection was made of the Round Tower and the Cathedral, and a visit paid to the grounds of Brechin Castle. Of the round tower, Jervise says: "Whether we are to attribute these erections to Culdeism or not, we have both at Brechin and at Abernethy (near Perth) the only Scotch specimens of the Round Tower. Few things have excited so much controversy as these, not only regarding the history, age, and use of the buildings, but also the fact of their being found only in Ireland and Scotland. They have been ascribed to Eastern worship and Druidical rites, to ante-Christian times, and to a late mediæval age, as well as to Danish artists and to monastic requirements. In all probability they were places for security in times of disorder;

if the space in the several floors was small for the shelter of persons and valuables, the round, smooth outer circumference and the narrow doorway, which was always at a considerable distance above the ground, made resistance the easier, while a bell or a fire at the top would readily spread any alarm." The Cathedral Church of Brechin was founded by King David I., probably about the year 1150, and some of the remains of the Church date from then. The nave and transepts, however, have been "barbarously supplanted by a modern sash-windowed Church." "The west door of the Church," writes Jervise, "although much decayed, still presents some beautiful pieces of carved work, and among these are traces of an almost unique figure in Gothic Architecture, called the reed pattern, the only other example of which, so far as is known, is on the north doorway of Ely Cathedral. The large west window over the doorway, with graceful mullions and flamboyant tracery, is still almost entire; and although little exists of the east end or chancel of the Church, the portion still remaining is a fine specimen of the Early English style of Architecture, being decorated by the bay-leaf and dog's-tooth enrichment."

#### RESTORATION OF ORDSAL HALL.

MR. A. DARBYSHIRE, under whose direction the restoration of Ordsal Hall, Manchester, is being carried out, recently described the plan of the works in progress to the members of the Antiquarian Society, who visited the hall. Mr. Darbyshire explained that the restoration is part of a plan which includes the building of a Church close by the hall, and of a parsonage-house. The hall itself when restored will be used for Church mission purposes. The whole cost will be borne by Earl Egerton of Tatton, and altogether it will reach about £10,000. The principal hall, of fourteenth century design, has been made to appear very like what it was several hundreds of years ago. When the work was begun the interior was found to be crusted over with dirt and plaster. Both have been removed, and the fine carved oak beams of the ceiling laid bare. The oaken woodwork of the outer wall has also been renewed, but only where necessary, with beams from timber felled in Tatton Park. The floor of the hall, which must have been relaid in comparatively recent years, was in fairly good condition, and it has not been moved. Had it been unsound a new floor could have been laid about a foot lower. This would have been preferable, as the former "restorers" unfortunately raised the floor, and so obscured the proportions of the oak pillars which support the roof. In former times additions appear to have been made to the hall, both to the east and to the west, by its succeeding owners, according to the design then in vogue. The westward portion, for instance, which was built by Sir A. Radcliffe about the middle of the seventeenth century, is wholly different from the great hall. It will be renewed where necessary, and used as a Church and mission offices. On the east it is supposed that the Oratory stood formerly, and there are some curious old rooms, one of them with the secret chamber which so often figures in novels dealing with life in the Stuart period. This chamber, really a hiding-place in the roof, has been laid bare. It is hoped that the Oratory may, as far as possible, be again made as it was formerly. The Church, to be built to the eastward of the hall, is to be of similar design to the hall, and a quantity of oak timber, taken years ago from the old Church of St. Mary—now replaced by the Cathedral—will be used in its construction.

At the meeting of the Calverley District Council last week, tenders for the sewage works were considered, and that of Mr. J. W. Greaves, of Calverley, was accepted, subject to the execution of the proper contract and security. The work will include the construction of precipitation tanks, the extension of the outfall sewer, and other necessary works.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

July 7th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

IN order to make room for the memorial of Lord Leighton, the Dean and Chapter of St. Paul's Cathedral have decided, in spite of vigorous protests, to remove to the crypt the fine monument erected in the year 1802 to the memory of Commander Burgess, of His Majesty's ship the *Ardent*, who was killed in a daring and successful attempt to break the enemy's line near Camperdown on Oct. 11th, 1797. The monument is situated at the western end of the south aisle, close to the Wellington Chapel. It is the work of Mr. Thomas Banks, R.A., and consists of a sarcophagus suitably ornamented, on the top of which are two large figures. The female form, symbolical of victory, is represented as placing a sword in the hands of the gallant sailor. The figure of the commander is a fine piece of work, and the likeness is said to be extremely good. The Burgess monument was erected in accordance with the unanimous request of the Legislature, and it will be a crying scandal if the Dean and Chapter persist in their avowed intention of relegating to the obscurity of the crypt a monument "raised by a grateful country to one of those heroes who, under the blessing of Providence, have established and maintained her naval supremacy and her exalted rank among nations."

MR. SPIELMANN makes a very sensible suggestion in the *Contemporary Review* regarding the housing of the Wallace collection. There have been no fewer than seven separate schemes proposed, though only two have been reserved for final decision—the acquisition of Hertford House, and the erection of a gallery on the west of and in immediate proximity to the National Gallery. It is this last that Mr. Spielmann advocates. There would be several advantages in combining the collections, not the least important arising from the fact that that of Sir Richard is strong where the National Gallery is weak, and "by arranging the new palace of art beside the old, a complete panorama of the world's art would be presented to the student's eager gaze." Besides, the risk of fire to which the National Gallery is at present exposed from its proximity to St. George's Barracks would be entirely got rid of. Such a building as is proposed would, of course, cost a considerable sum of money, but so would any other scheme. As, however, the Gallery would inclose a collection the value of which has been estimated at about three millions sterling, it is to be hoped that no silly notions of niggardly economy will be allowed to prevail.

ALTHOUGH Gray's Inn is the smallest of the Inns of Court, it is in many respects the most interesting. There is a certain picturesqueness about the old brick houses with their red-tiled roofs that you will rarely meet with elsewhere in London. And the gardens are finer than those of any of the other Inns of Court. The main avenue, with its immemorial elms and shady sycamores, is, doubtless, not much changed since the days of good

Queen Bess. But the peculiar pride and glory of Gray's Inn is its ancient hall. Somewhat insignificant externally, inside it is, perhaps, as striking as any of the sort in England. The roof, dating from the sixteenth century, is a fine example of the Gothic style. The beautifully carved screen which supports the minstrel gallery, as well as the long oak dining tables, is said to be made of wood taken from the ships of the Spanish Armada. Tradition has it also that both screen and tables are gifts of Queen Elizabeth. There is, indeed, something mediæval in the atmosphere of this grand old place, with its air of remoteness from the hurry and bustle of the nineteenth century.

THE completion of the present restoration of the north-west gable of Peterborough Cathedral was marked by an interesting ceremony on Friday afternoon, Dean Ingram, Canon Clayton, and several others being present to witness the placing in position of the cross which terminates the gable. The whole of the cross, with its original base, was lifted into position in one piece. The work has been most satisfactorily carried out, and very few new stones have had to be introduced to take the place of those which were completely ruined by the weather. There are only two new stones in the outside order of the great arch, and with the exception of two small patches the large string course has been replaced intact.

AN interesting Inn—the "King's Arms," Lancaster—intimately associated with Charles Dickens, was recently almost burnt to the ground. It is, perhaps, not generally known that the "King's Arms" is the identical hotel at which Charles Dickens and Wilkie Collins sojourned during a trip they made together in 1857, when they wrote an account of their adventures, soon afterwards published in "Household Words" under the title of "The Lazy Tour of the Two Idle Apprentices." The Inn is described by Dickens as "a genuine old house of a very quaint description, teeming with old carvings, and beams, and panels, and having an excellent old staircase, with a gallery or upper staircase cut off from it by a curious fencework of old oak, or of the old Honduras mahogany wood. It was, and is, and will be, for many a long year to come, a remarkably picturesque house; and a certain grave mystery lurking in the depth of the old mahogany panels, as if they were so many deep pools of dark water—such, indeed, as they had been much among when they were trees—gave it a very mysterious character after nightfall."

A PROPOSAL will shortly come before the London County Council for the construction of a suitable embankment along the whole river frontage of Battersea Park. The existing river wall is of a very slight nature, and a large proportion of it is in an extremely bad condition. The Parks and Open Spaces Committee of the Council, which is making the present proposal, states that the present wall may be described as a mere skin of concrete blocks, generally 9in. in thickness, and in some cases less. For some years past it has been the practice to patch the worst places from time to time at an annual outlay of some £400 or £500. The result, however, has not been satisfactory, and the deterioration which has arisen in past years has not been overtaken, so that the wall is steadily growing worse. The Council's engineer reported in 1895 that the cost of putting the wall into a proper state of repair, if undertaken at that time, would be about £6000, and that even then there would be a subsequent annual charge of about £200 for its maintenance. Under these circumstances the committee is firmly of opinion that the best and most economical course would be to reconstruct the wall in a substantial manner. The length of the river front of the park is about 1300 yards, or about three-quarters of a mile, and the engineer estimates that a granite-faced wall with a granite parapet can be constructed there for the sum of £43,500. In view of the large recurring charge for maintaining the

existing wall, and of the economy that would ultimately be effected by the substitution for it of a permanent granite embankment, and also taking into account the enhancement of the appearance of the park, the committee strongly recommends the Council to adopt its scheme.

AN instructive instance of the enterprise of English firms is afforded by the report just published from Lord Cromer on the subject of bridge-building in Egypt. In the first place, Lord Cromer ventures to point out that it is a mistake to suppose because a bridge has been too cheaply constructed and has consequently broken down that therefore the most expensive offer should for the future be accepted. The English offers, he says, have invariably been higher than those of any other nation for the construction of bridges. In the case of the Embabeh Bridge, which has recently collapsed, seven offers were received. Of this number one was from an English firm; it amounted to £138,000. The next two offers, each of £96,000, were from a German and a local firm respectively. The lowest offer, £67,340, was from an Italian firm. So that Italy was willing to undertake the project at less than half the price demanded by England. The contract was eventually given to a French firm at £81,200. Even after the £33,000 which now has to be expended on strengthening the bridge has been paid, the total cost to the Egyptian Government will only be £114,200, or nearly £24,000 less than the English offer. Lord Cromer gives another example of the very high prices asked by English firms. The English bridge builders have at times complained of the system under which they have had to prepare their own designs. After much trouble this system was changed. Designs were prepared by the Egyptian Government for certain iron bridges, and tenders were invited. At the time the Government thought the total cost would come to about £7000. Ten firms competed. The English, as usual, headed the list with an estimate of £16,619. A French firm came next asking nearly £7000 less. The lowest estimate of £5807, was tendered by a Belgian firm. It can hardly be contended, in the face of these figures, that it would have been possible to accept the English offer.

LAST week there was a "field" day at Sotheby's, and a record one in the history of English book sales by auction, about 150 lots realising a total of close on £10,000. With one exception (a Bible) every article was sold, and in this respect the Ashburnham library was the most notable which has come under the hammer for very many years. The day's sale commenced with an extraordinarily rare Block Book, the *Biblia Pauperum*, impressed on forty leaves on one side only, and dating from about the year 1430; this realised £1050. The principal interest was centred, however, in the vellum copy of the first printed edition of the Bible, and the first book executed with metal types, the work of Gutenberg and Fust of about 1450-55. This copy, for which the late Earl of Ashburnham paid £3400 at the Perkins sale in 1873, is the most splendidly decorated copy of the few that are now known. It realised £4000, which is £100 more than the amount paid a few years ago for Sir John Thorold's copy on paper, and which is, moreover, the highest price ever paid for a copy of this book. For a copy of the second edition of the Latin Bible, also printed on vellum, but the first printed Latin Bible with a date—i.e., 1462, from the press of Fust and Schoeffer, the sum of £1500 was paid—the Thorold copy realised £1000, whilst that in the Sunderland library fetched £1600. On the following day two remarkable prices were obtained. A fine copy, with four miniatures, of Boccaccio's "De la Ruine des Nobles Hommes et Femmes," a folio printed in 1476, but of which several of the early pages were in facsimile, sold for £695. The Sunderland copy, the last one sold in England, and without the miniatures, produced £960. "Boetius de Consolatione Philosophiæ," translated into English by the poet Chaucer, and printed by Caxton, fetched £510.

Mr. G. C. HARRÉ, whose work, whatever may be the medium in which it is expressed, never fails to interest, opened at 118, New Bond Street, last week an Exhibition of "One Hundred Lilliputian Pictures in Oil." These consist of views in London, landscapes in various parts of England, and subjects found in Venice, Holland, and many other countries where the Artist has wandered in search of material.

At the Croydon County Court last week Judge Lushington made some vigorous comments upon the commercial morality of builders. Addressing his remarks to a builder who appeared as defendant in a judgment summons, his Honour said: "O, you builders, you harden the heart of a judge. I have builder after builder living upon fraud, and defeating his just creditors in every unjust way. The whole trade is degraded, and the good name and fame of the country are injured too." There

Fletcher, Professor Roger Smith, Mr. J. Slater (vice-chairman of the Examining Board of the R.I.B.A.), and Mr. W. H. Pratt (president of the Architectural Association). Silver medals were awarded to Mr. J. C. Brown, Mr. J. Crewdson, and Mr. H. C. Williams.

THERE was a keen contest at Christie's last week over the drawings by Rossetti and Sir E. Burne-Jones from the collection of the late G. P. Boyce, R.W.S., some of the most interesting being bought by Mr. Sidney Colvin for the British Museum. Rossetti's paintings from the same collection were also sold, and the sale included the fine portrait of a young man by Holbein which will be remembered by visitors to Burlington House and the Tudor Exhibition. Though not so important or so perfect as the picture which the nation was too poor to buy at Sir John Millais' sale, it was one of the few genuine examples of this

basement are two lifts to convey the students to class-rooms on the upper floors. The ground floor contains a fine central hall, round which are placed the administrative offices of the schools, the principal and vice-principal's rooms, the secretary's office, the situation bureau, waiting-rooms, &c. The class-rooms are large, light, and airy, and will accommodate 1500 pupils. The Architect of the building is Mr. G. D. Martin, of 3, Pall Mall East. The contract for the erection of the school is in the hands of Messrs. Perry and Co., the total cost being estimated at £27,000.

WHILE Kensington Palace has never been without tenants, many of the rooms which may be regarded as the State apartments are in a decaying condition. The dilapidation has been going on for years, and has caused a good deal of anxiety to Her Majesty's Office of Works. The ceilings are giving way, damp

are doubtless black sheep in every flock, and no doubt Judge Lushington had cause to complain; still, his strictures are severe upon those builders whose work and credit are beyond reproach.

THE results of a year's careful work on the part of the students attending the Carpenters' Company's lectures on the above subjects, were seen when the annual examinations were held at the Hall, in London Wall, and at the Technical Schools in Great Titchfield Street. The main feature of the Company's examinations consists of the practical tests which all the candidates have to undergo, and it was for this part of the proceedings that the schools in Titchfield Street were used. The candidates this year exceeded in numbers all former entries, and the judges had no light task in awarding the prizes, of so excellent a character was all the work executed. Among the examiners acting for the Company were Sir Philip Magnus, Professor Banister

rare master still remaining in private hands in this country.

It has been found necessary to provide much more extensive premises to accommodate the pupils attending Pitman's school. The proprietors accordingly in December last obtained a site at the corner of Russell Square and Southampton Row on which to erect a new building, which, in view of possible extension in the near future, has been arranged so as to form the first wing of a much larger structure. The present building has a frontage of 67ft. and a depth of 110ft. It contains seven floors and a basement, and in the matter of light and air is exceptionally favoured. The front is of red brick with Portland stone facings, and the principal entrance faces into Southampton Row. The building will be illuminated with the electric light, and heated and ventilated on a new American plan. The basement will contain the cloak-rooms and lavatory. Communicating with the main corridor in the

courses affect the walls, and the woodwork is decaying. It is estimated that nearly £30,000 would be required to put the palace in a thorough state of repair, and room has never been found in the Estimates for such a large exceptional expenditure.

"PROBABLY there are few, even amongst archaeologists, who are aware that there are within seven miles of the Bank of England the well-defined remains of a Roman camp," writes Mr. F. A. Edwards. "This camp is situated on Uphall Farm, on the eastern bank of the river Roding, between Ilford and Barking, and is of the usual four-square shape on a slight elevation above what was formerly marshy ground. The vallum, though much reduced by centuries of agricultural operations, is still recognisable on all four sides, whilst on the river side there is a higher elevation, evidently for look-out purposes. Now this relic of the past is threatened with extinction by the irrepressible builder, the farm being advertised for sale as

building land. Cannot the destruction of this antiquity of some fifteen centuries be prevented? If the area could be dedicated to public purposes and the inclosure turned into a garden or even cricket field, it would be of lasting benefit to the fast-growing population of this district. Once destroyed it can never be replaced."

THE widening of Upper Thames Street is now on the point of completion, the last claim having been settled. The work of widening this now much-used thoroughfare was commenced over forty years ago, and bit by bit and house by house the scheme has been carried into effect. The first portion of the improvement having been more or less completed, there remained several projecting properties which marred the street line, and were responsible also for occasional "blocks" in the heavy and increasing traffic which passes along the street all day long. These projecting pro-

#### AN INTERESTING EXHIBITION.

A LARGE collection of antique tapestries, embroideries, brocades, &c., is at present attracting much attention at Messrs. G. J. Waring and Sons' show-rooms in Oxford-street. Art connoisseurs especially have succumbed to the allurements of the artistic catalogue which chronicles the contents of the collection. Apart from its historical importance, the Art of embroidery has, at different periods, been closely associated with the kindred Art of painting—authorities have not hesitated in recognising the supremacy of this ancient Art over painting in the first centuries—and one cannot fail to be much impressed by the marvellous skill of the Artist and the exquisite beauty and splendour of his work, as revealed at Messrs. Waring's Exhibition. The collection embraces examples from all parts of the East, and from the seventh and eighth centuries down to modern times. In early

ture (among which is an oak room from the house of Rubens at Antwerp), antique silver, and a collection of English productions of the "Della Robbia" pottery industry. Both the Architectural and the pottery departments are well represented. From the former department are shown fountains, friezes, symbolic panels, &c., and from the pottery department are circular plaques, card trays, vases, dessert and tea services, &c., the whole showing a remarkable variety of design and intention. We are able to illustrate one or two of the specimens of antique silver which forms an interesting portion of the Exhibition. The missal cover is heavily embossed and chased with figures of the Twelve Apostles, the centre medallions representing "The Crucifixion" and "The Resurrection." The Beaker (569) is of Norwegian origin, and is chased with figures representing the four seasons. The Dutch vase and cover (No. 575) is richly embossed with tableaux of "Moses and the Tables of

perties have been acquired by the Commissioners of Sewers, and in the course of a month Upper Thames Street will have a clear street line from Peter's Hill to Queen Victoria Street, and, in addition, it will be paved with Australian hard wood. The cost of the improvement, from start to finish, has been exceedingly heavy.

A SOMEWHAT novel experiment has been successfully performed in Kirk Michael. The proprietors of Glen Wyllin having discovered that their large refreshment rooms were wrongly placed in the glen, decided to have them moved to a more convenient quarter. Instead of pulling down the structures, Mr. Jno. D. Kelly, contractor, Kirk Michael, has carefully stayed and bolted the various parts of the refreshment rooms, fastened a strong wire rope round the whole, and with the help of a traction engine dragged the buildings bodily a long distance up the glen.

days the Art of embroidery seems to have been much favoured by Royalty, and the rivalry to excel, fostered by the beneficent rays of popularity, resulted not only in the production of some magnificent examples, but, about the sixteenth century, in the perfection in the Art of needlework. By this time embroidery had extended itself from the Church, to which heretofore it had mainly been confined, and invaded many branches of Art. Schools of embroidery developed in Italy and France, Milan and Florence became famous centres. Of the various schools, the oldest in origin was that derived from Oriental works. Then comes the Italian School, characterised by the marvellous elegance of its arabesques. Lastly, we have the French School, with its realistic tendencies. Of these schools, and of the best periods, the present collection will be found fully representative. The Exhibition also includes many fine examples of antique furni-

ture "and "The Worshipping of the Golden Calf," the remaining ornamentation being scroll-work and clusters of fruit. No. 572 is a Dutch Jardiniere, of graceful design, of the Louis XV. period, chased and embossed. The Spanish chasuble illustrated is of the sixteenth century; the centre embroidered on red velvet with arabesques and saints. No. 152 is a fine specimen of a sixteenth century Italian chasuble and apparel, with silver and coloured silk embroidery, on a yellow silk ground.

WITHIN the past few days the Burgomaster and Sheriffs celebrated the 200th anniversary of the rebuilding of the historic Grande Place adjoining the Hotel de Ville, Brussels. This famous square has been recently restored in harmony with its sixteenth century traditions, and forms the most perfect example extant of that period when the Early Renaissance was supplanting the Gothic style of Architecture.

## Professional Items.

**ABERDEEN.**—A committee of the Town Council was held last week to consider the altered plans of the elevation of the new Fire Brigade Station. Mr. Mackinnon, the Architect for the new buildings, was present, and submitted designs of the elevation as altered. These showed a story added to the main building, making it three stories instead of two, which, while improving the appearance of the elevation, provides accommodation for three additional married firemen—saving extension in case of future additions to the staff. An additional story has also been put on the Firemaster's house at the end of the main building, providing accommodation there for the Assistant Firemaster. There is also an additional workshop at the back. The pavilion roof of the main building has been discarded, and in its place there is now an imposing elevation, marked with an effective granite balustrade, and other architectural features. The cost of the design is increased by the alterations. The original design was estimated to cost £10,400. As submitted to the committee a fortnight ago, with several alterations suggested by the committee, the design was estimated to cost £11,625. As now submitted, with further alterations, it is estimated to cost £12,215. The sub-committee resolved unanimously to recommend that the design as now submitted be adopted.

At a meeting of the Finance Committee of the Aberdeen Town Council the question of the site for the new Post Office was under consideration. Two schemes were under discussion. The first proposal was to the effect that the depths in rear of the Queen's statue in St. Nicholas Street should be filled up, the block of property from the Wallace Tower to St. Nicholas Street cleared away, as well as other property for some distance further along St. Nicholas Street; that St. Nicholas Street should be made a street at that part 70ft. wide, or flush with the gable of the Town and County Bank buildings; and that the new Post Office should be erected on part of the cleared ground about the foot of Netherkirk-gate, with a frontage to St. Nicholas Street. This, it was urged, would not only provide a central site for the Post Office, but would effect at the same time a decided city improvement in respect alike of the widening of St. Nicholas Street and the clearing away of a considerable amount of congested dwellings lying between Guestrow and St. Nicholas Street. The view was expressed that the proprietors in the neighbourhood might be willing, in view of all the circumstances, to accept a fair and reasonable sum for the property required to enable the improvement to be carried out. In the event of this scheme proving too costly, a second one was in view. This was to acquire as a site for the Post Office the block lying between Gaelic Lane and Little Belmont Street; widening Gaelic Lane considerably so as to make it a thoroughfare of 50ft.; and, if necessary, closing up or diverting Little Belmont Street and providing a frontage for the Post Office either to Gaelic Lane, Back Wynd, or Little Belmont Street. The feeling of the committee was in favour of the St. Nicholas Street scheme, but it was remitted to the burgh surveyor to bring up to a future meeting a report as to the amount of property that would have to be acquired in connection with both schemes.

**BATH.**—Mr. F. H. Tulloch, C.E., Local Government Board Inspector, recently held an inquiry, at the Guildhall, respecting the applications of the Urban Sanitary Authority for power to borrow sums of £6880 and £3750 for electric light works. The former amount was part of a sum which the Board declined to sanction the raising of, after a previous inquiry, last October, and was for extension of mains and expenses incurred in opposing the company's application for a provisional order, and the purchase of their undertaking. The £3750 was for new foundations for the new and heavier plant to be put down; a new roof to the works, and other expenses at the station.

Mr. J. F. Meehan opposed the application as to extensions, contending that it was premature, and that the works should be first placed in a thoroughly satisfactory and efficient state. The Inspector at the same time inquired as to a proposed loan of £5000 for removing wood pavement in several streets, and for laying wood down instead of stone on the west side of Queen Square.

**BEXHILL.**—The new Congregational Church in Station Road was opened on Wednesday. The building is but the larger portion of a scheme which comprises the Victoria Hall, built in 1887 at a cost of £1700. The total estimate for the whole scheme, including Church and hall, with furniture, was £3900, of which £1800 was set aside for the former. The Church presents a substantial appearance. The site was an extremely awkward one upon which to erect a Church, but the Architect has erected an L-shaped structure, and has economically utilised the space by adding a side projecting aisle, which forms a bay. The building is constructed of red bricks, with a permanent green slate roof, late Gothic style of Architecture being adopted. A spire, covered with oak shingles and Elliott's patent stone dressing, rises up a considerable distance above the north-eastern corner of the roof. At the opposite corner a small ornamental turret serves as a buttress to the clerestory, and also forms a relief to the gable, the apex of which is carved stone. The building is surrounded by an oak pale fence, shaped to design, with handsome posts at the entrance gates. At the south side of the Church a private entrance leads to the vestry, which is situated at the extreme western end, and from here direct access is obtained to the dais, upon which the pulpit is placed. The vestry is also connected with the platform of the Victoria Hall, and is fitted with complete lavatory accommodation. The northern entrance forms a lobby, leading to the Church, the heating chamber, and other offices, as well as the lower portion of the Victoria Hall. The interior of the Church is divided into a nave and two aisles, the seating being arranged in semi-circular fashion. There is a spacious gallery at the eastern end, which will accommodate some eighty persons. The whole building will comfortably seat 556 persons.

**BOCKING.**—The new Church of St. Peter, Bocking End, built as a chapel-of-ease to the Parish Church, was consecrated recently. The Church stands upon a site adjoining the Braintree and Bocking Public Gardens. The design was prepared by Mr. J. T. Micklethwaite, and the building was entrusted to Mr. W. Parmenter. The committee directed the Architect to design the Church to hold about 600 persons, but in such a way that part only—itsself forming a complete Church—should be built first, for the accommodation of 300. The parts completed are the nave, with its clerestory, the chancel, the lower part of the tower, which adjoins the chancel, and the vestries, with temporary porches to two doors near the west end. The walls are of stock brick, plastered inside and rough cast outside, and with red brick quoins and plinths. The roof is of red tiles. The ceiling is of wood, ribbed, and painted white. The floor of the nave is laid with oak blocks, and that of the chancel with stone quarries, on a level with the floor of the nave. The carved oak pulpit was purchased with a gift of £50, by the trustees of Christ Church, Braintree, on the dissolution of that place of worship. The rest of the Church furniture, with the exception of a few separate gifts, was provided out of the bequest. The nave is temporarily seated with chairs. The font is of plain Portland stone. There are four arches on either side of the nave resting on stone pillars standing in full relief from the plain brick walls.

**BRIGHOUSE.**—The Town Council has accepted the tender of Mr. Geo. Taylor, contractor, Brighouse, for the erection of buildings, &c., at the sewage outfall works at Cooper Bridge in connection with the Corporation's sewage scheme. Already £21,299 has been spent on the sewage scheme, including the sum

of £15,000 for the purchase of the land at the outfall works. Mr. Taylor is now engaged on the contract—the construction of sewers—amounting to the sum of £43,000.

**CRAIGMILLAR.**—A Church is about to be erected at East Suffolk Road. The building will accommodate 709 seatholders, and the hall and class-room will afford sitting room for 270 additional persons. Situated at the east end of East Suffolk Road, Craigmillar Park, the building will run east and west, and will consist of nave, with passages, aisles, transepts, apse, hall, and class-room; while provision will be made for future extension in the shape of session-house and ladies' rooms, &c. A doorway through the tower will form the principal entrance to the Church, and access will thereby be given to a vestibule extending along the whole west end of the building, with an exit porch at the opposite side from the tower. There will be a gallery at the back or west end of the Church, and the style of Architecture adopted by the Architects will be of the decorated Gothic period. On the west gable will be a seven-light window, with buttresses at the sides, and the clerestory will have a range of four three-light windows, the transepts being lit by a three-light window in each gable. The apse will have a single-light window in each bay, which will be filled with stained glass. A special feature will be that the hall will be of an octagonal shape on plan, to suit the ground, rather suggesting the chapter-house of a Cathedral. The contracts for the hall and offices have been already taken, and the Church will be proceeded with as soon as that part of the work is finished. Red stone from Cornoskle and Hailes Quarries will be utilised, and green slates from Buttermere will be used. The Architects are Messrs. Sydney Mitchell and Wilson.

**DARLINGTON.**—During the last 30 years the post office premises in Northgate have been thrice extended, and what was originally a large garden in rear of the original building has been gradually incorporated until not a foot of available space was left for further extensions. The need for further accommodation has become imperative. The owners of the land at the south side of Crown Street were approached, and a plot acquired with an area of 665 square yards for further jected extensions. The work of extension is expected to commence immediately. The post-office at present possesses a road between this building and the premises of Mr. W. Harding, and also has a right of way through into Priestgate, and it is supposed that one result of the extension will be that the road under the archway in Northgate will be carried further east and then south into Priestgate.

**FORMBY.**—The pretty little Church of Formby, consisting of a nave only, has recently been enlarged. The Church, designed in the Early Decorative period of Gothic Architecture, has now additions of chancel and transepts. The present Church stands near the site of a mediæval Church which has long disappeared, but of which some interesting archaeological remains still exist, and many old stones lying about the site belonging to the old Church, including the old font, have been collected by Mr. Jonathan Formby, barrister, and now form a very pretty feature, grouped together at the west end of the Church. The new chancel has carved oak stalls and vicar's reading desk, with a beautiful stained glass window, the work of Mr. Rowlands, of Slater Street, Liverpool. The south transept is for the purposes of the organ and a vestry for the choir. The organ has been considerably improved by the organ builders, Messrs. Hardy, of Stockport, and the front decorated by Mr. James Smith, of Waver-tree. The Architectural work has been entrusted to Mr. William Parslow, the sole contractor being Mr. James Taylor, of Blundellsands. The masonry has been carried out by Mr. T. Taylor; Messrs. Paterson and Son, of Liverpool, have executed the joiners' work; Messrs. Clark and Taylor, the plumbing and decorating; and Mr. Littleton, the slating and plastering. The heating of the Church has

been carried out by Messrs. J. E. Cooper and Sons, of Liverpool. The cost of the additions of chancel and vestries amounts to about £1500, and the renovation and decoration of the west end will be covered by an expenditure of between £200 and £300.

**GLASNEVIN.**—The Chapel just erected in honour of the Sacred Heart at the St. Vincent de Paul Orphanage, Glasnevin, is a pretty edifice, in the Romanesque style of Architecture, corresponding with the Orphanage. It consists of a nave and chancel, with sacristy adjoining. Its length is 72ft., its width 24ft., and its height 32ft. It is lighted by six windows on each side, and three over the chancel and nave. The roof of the nave is open; it is of pitch pine, stained and varnished, with curved principals springing off Portland stone corbels on each side. The roof of the chancel is moulded and panelled. The chancel arch is of red Aberdeen columns with stone caps, annulets, and bases, the caps being carved. At the end of the Church facing the altar is a gallery with ornamental front in pitch pine; it is approached by a circular staircase. The Communion rail, the work of Messrs. J. McLoughlin and Son, is of wrought iron and brass. The benches, which have not yet been completed, are being executed by Messrs. Noonan Brothers, Bolton-street. The Church is built of black limestone, with chiselled granite coign. The Architect is Mr. George C. Ashlin, R.H.A., and the contractors Messrs. Conolly and Son. The cost of building the Church is estimated at about £2400.

**GUISELEY.**—At a meeting of the Guiseley District Council last week Messrs. S. Mounsey and Sons submitted plans showing the conversion of the old Wesleyan Chapel into public baths. It appeared that the main sewer in Town Street was not low enough to take the waste water from the proposed baths, and it was proposed that the Council take steps to lower the main sewer to such a depth as would drain the baths, the approximate cost of this being stated to be from £25 to £30. The plans were approved.

**HEADLESS CROSS.**—During the gale on March 24th, 1895, the Wesleyan Chapel, which was erected in 1873, was totally destroyed. Energetic efforts were at once commenced to replace the building, with the result that the opening services of the new building took place last week. The style of the new Church, which is 65ft. in length and 41ft. wide, is Tudor Gothic, and the materials used are red brick with stone dressings, and joinery of deal and pitch-pine, stained and varnished. One of the principal features of the elevation is a tower and stone spire of about 70ft. in height, the latter being constructed of open tracery work. The plan consists of nave, with lean-to aisles and clerestory. The windows are glazed with slightly tinted leaded lights of geometrical design, supplied by Mr. T. H. Yates, of High Street, Smethwick. The Church will seat about 400 persons, including the accommodation of gallery, which is arranged over the main entrance corridor and lobbies. There is a minister's and choir vestry, with separate entrances, and suitable lavatory arrangements. The choir seats are arranged on each side of the chancel, and the organ-chamber placed on one of the sides. The Church, schools, and class-rooms are heated by means of a low-pressure hot-water apparatus, and have efficient ventilators. The floor of the Church is laid with a gradient towards the pulpit, the aisles being of solid blocks upon concrete. The pulpit is octagonal in plan and constructed in pitch-pine, having panels filled with rich tracery. The wrought-iron fencing and gas-fittings have been supplied by Mr. E. Glover, of Dudley Road, Birmingham. The builder is Mr. Henry Surman, of Redditch, and the Architects are Messrs. Ewen and J. Alfred Harper, of Colmore Row, Birmingham. The cost of the structure is about £2500.

**HULL.**—The scheme for the reconstruction of the Hull tramway system came before the Works Committee of the City Corporation recently. As the question of wood pavement

on various roads was included, the committee had to take into consideration the cost of construction of the proposed new system, and also the estimates of the cost of the paving of the large thoroughfares through which the trams run, with wood. The total cost of reconstruction of the system and wood paving was put down at £272,000. It was decided to adopt the Borough Engineer's estimate, and recommend it to the City Council for adoption.

**KIRKHEATON.**—A new chancel screen has been erected at Kirkheaton Church. The rails are of wrought-iron, surmounting a low stone wall on the chancel steps. In the central portion is a gate which opens inwards, and through it access from the nave to the chancel is gained. A large reredos is also to be erected in memory of the late Mr. W. E. Hirst. The reredos will be of oak, richly carved, and is expected to be ready by the middle of August.

**KIRRIEMUIR.**—The buildings of the Parish Council are to be replaced by a new building. Messrs. L. and J. Falconer, Architects, Blairgowrie, were commissioned to prepare plans and take in estimates for the work, and it has been agreed to accept the tenders of the following tradesmen, all of Kirriemuir:—Masons, Messrs. Crabb and Ballentine; joiner, Mr. Charles Ogilvy; slater, Mr. Thomas Donaldson; plumber, Mr. Alexander Fyffe; plasterer, Mr. George Munro. The building will be built of stone from Ballinshoe Quarry. All the sides of door and window openings are moulded with hood mouldings and rubble arches over them. The accommodation consists of large entrance hall, public offices, with fire-proof strong room. The Council Halls have a coved ceiling, and panelled dado 5ft. high all round the walls, oak chimney-piece, and polished floors. The entrance Hall and lavatories are all laid with encaustic tiles, and all the woodwork is to be pitch pine varnished.

**LEEDS.**—At a meeting of the Leeds Board of Guardians last week—Mr. A. Hobson, vice-chairman, presiding—it was reported that the Finance Committee had considered Mr. Wilson's scheme for the raising of a sum of £20,000 by loan to defray the cost of altering the laundry and building new imbecile wards. The money, it was suggested, should be repaid in a term of thirty years—the Leeds proportion to be repaid from the balance of Consols standing in the name of that township. As an alternative scheme it was suggested that instead of raising a loan from outside, the Leeds township, as suggested by the Local Government Board in 1895, should lend to the Union the remaining portion of the £20,669 Consols after the payment of £6377 for the Nurses' Home, at the same rate of interest (2½ per cent.) now received on the Consols, to be repaid in the time of thirty years; the Leeds proportion of each repayment being credited to that township, and the out-townships' proportion being also paid to the credit of Leeds, thereby enabling the Union to benefit by the payment of interest on the loan in place of an outside body. Ultimately it was resolved that the clerk be instructed to apply to the Local Government Board for an order to realise the balance of the Consols standing in the name of the township of Leeds (or so much of it as may be required), and to sanction the loan to the Union for thirty years of the amount realised for the purposes of building the imbecile wards, altering the laundry, &c.

**LEWISHAM.**—The Prince and Princess of Wales have fixed Monday, July 12th, to open a new hospital erected by the Metropolitan Asylums Board for the treatment of scarlet fever, diphtheria, and enteric fever at Hither Green, near Lewisham. The hospital in question is said to be the largest for acute cases of fever in the United Kingdom. The buildings are forty-two in number. There are eighteen pavilions, containing 108 wards, varying in size from those for single beds to others 120ft. long for twenty beds, with separate residences for the officials and larger "homes" for the male servants, the female servants, and for the nurses. This last consists of three

blocks containing about 200 rooms in all. The Architectural scheme places the servants, kitchens, stores, &c., in the centre, with a water and clock tower, and to the east, west, and south of this centre are grouped the various pavilions for the different diseases, all separated one from another and the whole being connected to the central administration by arcaded covered ways open to the air. Beneath these are subways for steam heaters, water and steam pipes, electric cables, &c. The whole hospital is heated by steam and hot water, lighted by electricity, fitted with fire appliances and electric alarms, telephones, and other modern appliances. Wells are being sunk on the site to supply water from the chalk, the estimated maximum daily consumption being over 200 tons. An apparatus is provided for softening the water before it enters pipes and boilers. All the cooking is by gas or steam, and the walls of the kitchen buildings are lined with glass. The Architect of the hospital is Mr. Edwin T. Hall.

**LIVERPOOL.**—The Great Northern Railway Company has just opened in Liverpool a spacious central dépôt, which occupies the site in the centre of the triangular block of property bounded by Manchester Street, Dale Street, and the Old Haymarket. The dépôt occupies an area of fully 9000 square feet. The main entrances are in Dale Street and the Old Haymarket.

At St. Bridget's, Bevington Hill, an altar in honour of St. Joseph has just been erected. Designed by Messrs. Sinnott, Sinnott, and Powell, Architects, and executed by Messrs. Norbury, Paterson, and Co., of Liverpool, the altar and its super-altar are chiefly of richly-figured and polished alabaster. Columns of polished red marble, arcaded paneling being between, uphold the altar, while the front of the super-altar is embellished with sunken and carved quatrefoils. Caen stone is conspicuously used above the super-altar, together with shafts of green marble, whose bases, bands, and capitals are ingeniously carved. These support a boldly recessed arch adorned with carving, which is topped by a crocketed gable. Panelled and carved pilasters with crocketed pinnacles and finials flank the sides. Both in conception and in working-out the altar of St. Joseph is distinctly good.

**LIVINGSTON.**—A memorial window has been placed in Livingston Free Church. It cost about £300. It occupies the south gable of the Church, and consists of three lancets 25in. in breadth, 13ft., 15ft., 13ft. in length, with a mullion of 14in. between them. Each lance has two groups of figures filling up its length without crowding it, six in all. The other windows have received Cathedral glass, and the two half-length windows over the pulpit have been treated in bright designs—the one symbolising the Law, the other the Gospel. These designs are the work of the firm (Messrs. Dickson and Walker, of Edinburgh) who executed the memorial window.

**LOWESTOFT.**—The new swing bridge at Lowestoft, which is considered to be the finest of its kind in the kingdom, weighs, including its working machinery, just about 350 tons. The two main girders have a length of 118ft., as compared with 100ft. in the old bridge, and the central roadway for vehicular traffic is 19ft. wide. Guarded footways (7ft. wide) formed by cantilevers from the main girders, run each side of the roadway, which has been constructed to bear a practically unlimited strain, it consisting of a corrugated bottom of steel plates with 6in. concrete above, faced with 4in. pine blocks. The top portion of the bridge—which will swing to the west quay—rests upon a great centre girder, the whole structure revolving upon a massive "live-ring" 31ft. 6in. in diameter, and having ninety-eight big rollers. Upon the top of the huge pivot, upon which the centre girder takes its bearing, is an elaborate bearing arrangement of twenty steel rollers, turned true to the radius of the revolving portions, above which is a gigantic screw to admit of lowering or raising the bridge to adjust the weight. Hydraulic power

will be used to swing the bridge into position over the river, and afterwards to tilt it on to the bearing blocks at the opposite side. The overhanging portion of the bridge from the central pivot is 82ft. in length, whilst the balancing end is 36ft., this being weighted with 2300 cast-iron weights, turning the scale at 85 tons, and packed away in a huge receptacle at the extremity of the structure.

MIDDLESBROUGH.—A new lecture hall and schools in connection with the Newport-road Presbyterian Church was opened on June 29th. The new premises are built at the rear of the Church and at the corner of Hill Street and Johnson Street. The main entrance from Hill Street gives access to the three rooms on the ground floor. The class-room is 32ft. by 21ft.; vestry and managers' room, 17ft. by 12ft.; another class-room, 21ft. by 17ft. There is also boiler-house, w.c.'s, and lavatory, and an additional access from Newport Road leading by the side of the Church. The large hall on the first floor is reached by a wide staircase formed throughout with cement concrete. This it is intended to sub-divide by movable partitions into two, so as to form retiring-room and platform at the rear. Access is also gained to this hall by a separate entrance from Johnson-street. It was originally intended to heat the large class-room and the hall by open fireplaces, but the committee decided to substitute closed slow combustion stoves. The rooms are well lighted with large windows, the upper part being made to open for ventilation, and also fitted with Boyle's ventilators on the ridge of roof. There are also large ventilating grates fixed into the flues below the ceiling for the same object. The Hill Street elevation is faced with white bricks in keeping with the Church, and the Johnson Street elevation with common bricks, with Normanby red pressed brick arches and dressings. Between the joists of the first floor it is treated with slag wool for sound deadening purposes. Each room in the hall has stained and varnished dado about 4ft. high, and where possible all the internal woodwork is treated in the same manner. The Architect is Mr. Walter G. Roberts, of 61, Albert Road, and the contractors were Messrs. Hudson Brothers, of Middlesbrough.

MORLEY.—A new Baptist Chapel was opened at Morley on the 29th ult. The cost of the building, which includes a series of class-rooms and an assembly-hall, was about £3200. The building is in the Classic style of Architecture, and the designs were prepared by Mr. Walter Hanstock, of Leeds and Batley. The whole of the external walls are in stone, with ashlar dressings, from the Morley quarries, and the interior woodwork is pitch pine, varnished.

OLDHAM.—The Town Clerk recently submitted to the Oldham Finance and General Purposes Committee a sketch of the enlargements and improvements to be carried out at the General Post Office, Union Street. He said that the Library Committee had agreed to give to the Government a plot of land to enable the extension of the present buildings to be carried out subject to certain rights being reserved to the Corporation, and also subject to certain improvements in the existing front elevation. It was thought the plan of the present office was a poor one, particularly as it had the Free Library on one side and the Science and Art School on the other. In the first instance the Government did not intend to alter the appearance of the existing building beyond making it two bays longer, but now it was its intention to improve the whole of the front and side elevation. The walls would have plenty of stone about them, and there would be ornamental pillars in the centre of the front of the building.

PUDSEY.—The old "clock Chapel" at Pudsey is about to be replaced by a more imposing building. The first stage in the erection of the new building was commemorated by the laying of memorial-stones last week. The site of the new chapel is that which has been occupied by the old building. The Architect of

the new Chapel is Mr. W. H. Dinsley, of Chorley, and the style of Architecture Free Corinthian. Accommodation will be provided for 1000 persons. The building will contain a gallery on three sides, the fourth being occupied by the rostrum and Communion table, from which the pews will radiate. The exterior will be of Yorkshire stone, the walling of the front of dressed ashlar. In the centre of the front elevation will be a handsome portico, flanked on the left by a tower, covered with sheet copper, in which provision will be made for a clock with two dials. The total cost of the building is estimated at £7000, of which more than half has already been raised. The contracts have been let as follows:—Brick-laying and masonry, Mr. Wm. Hutton, Pudsey; joiner's work, Messrs. Appleyard Bros., Bramley; glaziers and painters, Messrs. Higginbotham, Idle.

SCARBOROUGH.—Mr. Herbert Richardson, of the Engineer's Department of the Middlesbrough Corporation, has been appointed deputy engineer and surveyor to the Scarborough Corporation, the vacancy having been caused by the appointment of Mr. George Ball, who held the office, to the surveyorship of Bexhill-on-Sea. There were originally fifty applicants. Mr. Richardson is the son of Mr. W. B. Richardson, solicitor, Queen Street, Scarborough, and for six and a half years was in the Scarborough Borough Surveyor's office, under Mr. Joseph Petch, the present consulting engineer.

SEAFORTH.—An important change, and one that will add to the accommodation of the Bootle county police at Seaforth, is the removal to the new and commodious police station. The new station is situated in a most central position, and affords valuable facilities to the police by reason of the excellent accommodation its position furnishes from railways being contiguous. The building is plain, but substantial in character, and no effort has been spared to make it as complete and as appropriate as possible for the special purpose for which it has been designed. The general group of buildings will provide accommodation for one superintendent, one inspector, a married sergeant and constable, and seven single men, and for the latter there will be a day-room and dormitory. In addition, there is a well-appointed charge office, eight cells for prisoners, also a consulting-room, clerk's office, witnesses' and solicitors' rooms, and a large exercising or drill yard, with a covered shed attached. In that portion of the building facing Lime Grove will be a weights and measures office. The whole of the premises will be furnished with baths, hot water heating, and the most complete sanitary arrangements. The principal buildings face Seaforth Road, with a frontage of about 160ft. in length. The other elevation, with weights and measures office, cart entrance, &c., in Lime Grove, extend lineally about 150ft. The total area occupied for police purposes is upwards of 2500 superficial yards. The elevations to Seaforth Road and Lime Grove are red pressed brickwork, relieved with Bootle stone details. The Architects are Mr. George Holme, county surveyor, and Mr. Francis U. Holme, of 3, Westminster Chambers, Crosshall Street, Liverpool; Mr. Grocott is clerk of the works; and Mr. Walter Musker, of Bootle, the general contractor.

SHETTLSTON.—Evidence was heard before Sheriff Strachan, in Glasgow Sheriff Court last week, in the action by the Rev. John White and the managers of Shettleston Parish Church against the heritors of the parish to ordain them to take down and rebuild the church, the present building, it is alleged, being in a decayed condition. The Church is 146 years old.—Mr. R. A. Bryden, Architect, Glasgow, stated that the building was in an unsafe condition. All the walls showed signs of damage. Reconstruction, in his opinion, would cost about £2324; and the erection of a similar Church, providing similar accommodation, about £2916. He was strongly of opinion that it would be foolish to attempt to repair the existing building, and that an

entirely new Church should be built.—After further evidence the case was adjourned.

SOUTHPORT.—New Congregational Schools were opened yesterday in Chapel Street. In order the better to meet the wants of different bodies, the schools are so arranged with separate entrances that two considerable meetings, or even two concerts, can be held at the same hour without the one in any way interfering with the comfort of the other. The central hall will seat 400 adults or 500 children, and opening out of it are sixteen classrooms, one of which is to seat forty children. A ladies' drawing-room, a church parlour, ante-rooms, offices, and caretaker's house are all comprised in a building well lighted, well ventilated, and with electric fittings. The cost, inclusive of gifts of the electric lighting, and much of the more expensive furniture, comes within £4000.

SUNDERLAND.—The completed portion of the alterations at the Central Railway Station at Sunderland has been thrown open to the public. Two new flights of stairs to the platforms have been constructed, and will do much to relieve the heavy traffic. New booking offices, &c., are being constructed.

WOLSHINGHAM.—The Lord Bishop of Durham has just formally reopened the Parish Church, which has been closed for some time, undergoing important renovations and improvements. An addition has been made to the west end of the Church, where the baptistery is now located together with some additional seats, the floor of the Church has been entirely relaid with blocks of wood upon a concrete foundation, the Church has been reseated, and a new pulpit added, all being of Hungarian oak. The altar is also new, and an improved heating apparatus of hot water has been fixed together with a new lighting arrangement, the gas brackets being suspended from the roof in place of the old fixtures on the pews. The total cost of the work is close upon £800. The alterations were carried out to the designs of Mr. C. H. Fowler, Durham, by Mr. Westgarth, builder, Wolsingham; Mr. W. Hudson, joiner, Bishop Auckland; and Messrs. Dinning and Cooke, of Newcastle-on-Tyne.

YARDLEY.—An enquiry was held recently at Sparkhill, by Major H. D. Crozier, R.E., into the application of the Yardley Rural District Council for sanction to a loan of £1300, for the purchase of land at Sparkhill as a site for a depot, public offices, fire-station, and mortuary.

The whole of the £100,000 required for the purposes of the projected new Infirmary at Newcastle has been raised.

The drinking fountain in Peckham Rye Park, presented by Mr. Edwin Jones, was opened last week to the public.

The Hull City Council has adopted by a large majority the scheme for paving the principal streets with wood, at a cost of about £275,000.

The temple near Chatham belonging to the sect known as the Jezreelites, which was put up for public sale, has not yet been sold. The highest bid was only £5500. The building cost £40,000.

The memorial stone of the new parish house of St. Clement Danes and Clare Market was laid on Friday last. The building is being erected on a site in old Clare Market at the corner of Vere Street and Sheffield Street.

The great lens of the Yerkes telescope has had a narrow escape. The elevating floor on which it was placed in position dropped down 45ft., but fortunately the glass was uninjured. Nevertheless, the repairs will delay the use of the telescope until the autumn.

At Kilis, in Bessarabia, four hundred houses in that town have already been destroyed, and unless the floods subside the whole place may be wiped out of existence. The water is a fathom deep in the town, and locomotion is only possible by means of boats. Many of the inhabitants have sought refuge in the top stories of the houses, while others are camping in the fields.

## Trade and Craft.

### ELECTRICITY ON RAILWAYS.

An important departure has recently been made by the principal railway in New England—the New York, New Haven, and Hartford—in the adoption of electric power on a portion of its line. The latest move of the New Haven is regarded as a very important one for the railroads generally. The innovations upon previous methods are in this case striking. The thirteen miles of track from Hartford to New Britain is provided with a third rail to carry the electric power for the motors. In the laying of the third rail some novel ideas were for the first time put into practical use. The rail weighs 100lb. to the yard, and is shaped like a wedge, with a flat top. This affords a large conductive body with plenty of surface for the "shoes" which convey the current to the motors to act upon. Insulation is provided by simple blocks of wood, which, to the surprise of the experts, have been found to answer perfectly well, the loss of current being practically insignificant. At crossings, switches, and stations the current is conducted underground, while an ingenious automatic arrangement, operated by electricity, provides compressed air to operate a whistle for signalling. The experiments thus far made by the New Haven Company would demonstrate that neither snow, damp, nor flood interferes with the efficiency of the system. This demonstration is undoubtedly of great value to all railroads. On the New Haven's new electric line a speed of thirty to fifty miles is maintained with ease, while it is simply a question of construction of motors to keep up a speed of eighty miles an hour. Furthermore, it is claimed that there is no dead point in the revolution of an electric motor; it is the ideal solution of the transportation problem, and while some further questions have to be determined by the practical experiences with the new principles, extending over a longer period than has yet been possible, it is apparently true that the way has been opened for a further advance toward increased economy, speed, and utility in transportation.

### LEEDS ELECTRIC TRAMWAYS.

The work of putting down the plant for the running of electric cars between Roundhay and Kirkstall is proceeding very satisfactorily, and little doubt is now entertained that they will be ready for use by August 1st. The six miles of double lines along the route are practically complete; the overhead wires have been placed in position; the cars, with their plush-lined seats and easy running bogey carriages, are rapidly nearing completion; whilst the construction of the generating station at Crown Point has so far progressed that in a week or ten days the power necessary to propel the cars will be available. One of the engines—a 400-horse power compound condenser—has been completed some days. The dynamos have also been tested at the works of Messrs. Greenwood and Batley at Armley. There will be a pair of these dynamos to each engine, and in a week or so one pair of them will have been fixed in the generating station, and ready for use. Only one engine and pair of dynamos are required to generate the required electrical current to propel the cars, the provision of a duplicate engine and dynamos being that they may be used in case of emergency, thus obviating the necessity of stopping the service of cars to await repairs. There is a separate boiler to each engine. These boilers are supplied by Messrs. Clayton, Son, and Company, of Hunslet. These important changes in the tramway service of the city are being carried out under the supervision of Dr. Hopkinson. Mr. Eurbidge is clerk of works, and Mr. E. B. Martin, of the City Engineer's staff, is in charge of the operations at the generating station.

### CURIOUS CASE OF LIABILITY.

The case of Edward Taaffe v. the Dublin Southern District Tramways Company, heard at Dublin before the Lord Chief Baron and a

special jury, involved an important question as to the liability of the defendant company to pay compensation for damage suffered by traders in Kingstown by reason of the alteration in the levels of the streets and footways in the construction of the tram lines. The plaintiff is the lessee and occupier of the shops and premises, 50 and 51, Upper George's-street, Kingstown. He complained that on various days and at divers times in the years 1895 and 1896 the defendants, their servants and workmen, wrongfully lowered the road and footway running in front of plaintiff's premises, obstructing and interfering with the access to and egress from them, and lessened the support and injured the foundation of same. In consequence of these alleged wrongful acts the plaintiff complained that he was injured in his trade and business, and he claimed £2300 damages, and sought an injunction to restrain the defendants from the continuance or repetition of the injury. The defendant company denied the acts complained of, and pleaded that, under the provisions of the Dublin Southern District Tramways Order and Acts incorporated therewith, it was authorised to alter the level of the then existing tramway laid through Upper George's-street, Kingstown, including the portion along the frontage of the plaintiff's houses. The defendant company further stated that prior to the doing of the acts complained of the management, control, and maintenance of the street was vested by statute in the Kingstown Commissioners, being the road authority, and the defendants lowered the level of that street under the authority and by the direction of the Commissioners. The defendant company also pleaded that it did the acts complained of by leave and licence of and with the knowledge and acquiescence of the plaintiff. The jury, by direction, found for the plaintiff, with costs, and by consent of both sides the nominal sum of 6d. was named for damages, pending further proceedings.

### ELECTRIC LIGHTING OF LEEDS STREETS.

During the next twelve months important changes are likely to be made in the system of lighting the thoroughfares of Leeds. For Boar Lane and Briggate a new method of illumination has already been decided upon; the present gas lamps are to be removed, and the light supplied by forty arc lamps. These are to be placed on the top of the centre poles and side brackets, to be used in connection with the overhead electrical tramway system. The required electrical current for the lamps is to be obtained from the Corporation's tramway electrical generating station at Crown Point. Each light will have an illuminating power equal to about 1500 candles. These lamps are expected to be ready for use about the end of September. But this central avenue is not the only part of the city where a change in the system of lighting is contemplated. During the last fortnight the experiment has been tried of lighting Park Row, from the Cathedral to the end of Bond Street, with incandescent lights. The trial has proved satisfactory, and it is probable at an early date the committee will take into consideration the advisability of introducing this form of illumination in several of the main thoroughfares.

### BUILDERS AND THE BIRKENHEAD CORPORATION.

Cecil Edward Maples, of 14, Cook Street, Liverpool, was recently summoned for that he being a person laying out a new street exceeding 150 yards and not exceeding 300 yards in length, viz., a street in continuation of Mulberry Road there, unlawfully did lay out such street so that the width thereof is not 36ft. at the least.—Mr. Fearnley, for the Corporation, said the defendant had deposited plans for laying out a new street 30ft. wide continuing Mulberry Road from Wycliffe Street to the Mersey Railway, and then to be continued about right angles in a southerly direction under the name of Ashley Street, continuing as such on the western side of the railway for 83 yards and then turning again at right angles towards Wycliffe Street again in a westerly direction. The street thus

formed three sides of a square, the back of Wycliffe Street forming the fourth side. The Corporation contended that though this street had two names it was really one street, as the length of a street had to be taken from the point of entrance to the point of exit. Treating this street in this commonsense way Mulberry Road and Ashley Street formed one street exceeding 150 yards in length, and therefore should be 36ft. wide. By consent of the defendant, who wished the point settled, they were to be treated as though the street were actually laid out, but as a matter of fact the street as yet existed on paper only.—Mr. Charles Brownridge, Borough Surveyor, was called to prove the plans and show that these two streets were, in fact, one, and should be treated as such.—For the defence Mr. Layton contended that in reality this was three streets, and should be treated as such.—The magistrate said that after hearing the surveyor and examining the plans they had decided that what should be looked at was the object of the bye-laws under which these proceedings were taken. These were for the purpose of securing proper ventilation and preventing a congestion of traffic. In this case there would be no ventilation interfered with, because the end of the street abutted on the Mersey Railway, neither could there be a congestion of traffic, because carts would prefer the direct line along Wycliffe Street. The Bench were therefore of opinion that these were practically three streets, and not one continuous street, and gave a verdict for the defendant, with costs—three guineas.

WE beg to notify that Mr. Arnold Mitchell has removed from 16, Finsbury Circus, to No. 39, Great Marlborough Street, W.

THE popular seaside resort of Blackrock will shortly be connected with Dundalk by an electric tramway. The work will, it is expected, be commenced at an early date.

A new pulpit has been erected in St. George's Cathedral, Cape Town, to the memory of those who lost their lives in the wreck of the Drummond Castle.

At a meeting of delegates of the building trades held in Paris a few days ago, a general strike was resolved upon by an overwhelming majority; 20,000 men came out on strike at once.

THE work of extending the Royal Naval Barracks, Keyham, is to be commenced in September. The extension will cost £160,000, and it is proposed to so arrange the work as to ensure its completion by December, 1900.

THE new docks at Buenos Ayres, including two dry docks, were inaugurated a few days ago. The construction of the docks has occupied ten years. The contractor was Mr. Walker, and the cost was £7,000,000.

THE Chairman of the Devonport School Board recently laid the memorial stone of the new school for girls and infants, now in course of erection at Johnstone Terrace, Keyham. The Architects, Messrs. Hine and Odgers, presented to the chairman and vice-chairman a silver trowel.

BUSINESS is brisk at the Carrara studios near Spezzia, judging from the British Vice-Consul's reports. In addition to numerous commissions from Spain, Central and South America, and other countries, orders for marble busts of Her Majesty the Queen are being executed for several towns in England in connection with the Diamond Jubilee.

AN archaeological discovery of considerable interest has just been made near Thermopylae, between the old barracks and the watermills. It consists in the laying bare of sarcophagi containing bones, earthenware, and glass vases, bronze coins, medals, &c. It is believed that the skeletons are the remains of Leonidas' Spartans.

THE Prince of Wales's forthcoming engagements in London include the opening of a new fever hospital and public baths and wash-houses, erected at Hither Green by the Metropolitan Asylums Board. The parish of Lambeth has erected—after a long struggle on the part of the Progressives—an admirable set of public baths, which will receive notable publicity by the presence of the Prince.

## SOCIETY MEETINGS.

**Iron and Steel Institute.**—The autumn meeting of the Iron and Steel Institute will be held at Cardiff on Tuesday, Wednesday, Thursday, and Friday, August 3rd, 4th, 5th, and 6th next. The following papers have been offered for reading: "On Passive Iron," by J. S. de Benneville (Philadelphia). "On the Diffusion of Sulphides through Steel," by E. D. Campbell (Ann Arbor, Michigan). "On the Manufacture of Tin Plates," by George B. Hammond (Pensarth). "On a Spectroscopic Analysis of Iron Ores," by Professor W. N. Hartley, F.R.S., and Hugh Ramage, Assoc. R.Sc.I., F.I.C. (Royal College of Science, Dublin). "On Improvements in Shipping Appliances in the Bristol Channel," by Sir W. T. Lewis, Bart., Member of Council. "On the Iron Industry of Hungary," by D. A. Louis, F.I.C. (London). "On a Thermo-Chemical Study of the Refining of Iron," by Professor Honoré Ponthière (Louvain). "On Carbon and Iron," by E. H. Saniter (Wigan). "On some Mechanical Appliances at Penarth Docks," by T. Hurry Riches, M.Inst.C.E. (Cardiff). "On the Application of Travelling Belts to the Shipment of Coal," by Thomas Wrightson, M.Inst.C.E. (Thornaby-on-Tees). In addition to business deliberations, there will of course be the usual social attractions.

## Announcements.

## Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to pay postage.

All matter must reach the Editor by the first post on Monday morning to ensure its treatment in the current issue.

## Publishing.

The terms for free post Subscription to any part of the United Kingdom are SIX SHILLINGS and SIXPENCE per annum by half-yearly or annual prepayments.

## Advertising.

SITUATIONS WANTED, SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS.

Per line, Sixpence. Minimum charge, eighteenpence.

Three Insertions for the price of Two. Prepayments in the above advertisements is absolutely necessary.

Page or Paragraph Announcements, Trade Advertisements, Auction Sales and Contracts Open. Prices on application.

Small Advertisements for current week's issue are received up to first post Monday morning inclusive.

## Editorial and Publishing Offices:

Effingham House, Arundel St  
Strand, W.C.

## TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

## "TWYCLIFFE"

Patent Pedestal Syphon W.C. Basin.

A new Departure, embodying the latest developments in Sanitary Science, as applied to W. C. Basins.

Advantages claimed for the "TWYCLIFFE" Syphon:

Perfect safeguard against sewer gas and the evils arising therefrom.

Extra large water surface and great depth of water seal (3 inches) and large body of water in Basin to receive and deodorise soil.

Practically noiseless in action.

Simple in construction, reliable in action.

No complicated mechanism to get out of order.

Easily fixed as an ordinary Basin.

High-Class Article of Superior Material, Workmanship and Construction.

## CONTRACTS OPEN.

### LUTON RURAL DISTRICT COUNCIL.

The above Council invite TENDERS for the SUPPLY of SLAG for the year ending March 31st, 1898, to be delivered in accordance with terms of contract to be obtained of the undersigned.

Tenders and samples to reach the Clerk to the Council not later than SATURDAY, JULY 17th next.

The Council do not bind themselves to accept the lowest or any Tender.

By order,

Office, Dunstable, Beds,  
June 26th, 1897.

JOHN ANSTEE,  
Surveyor.

### THE URBAN DISTRICT COUNCIL of SURBITON.

TO BUILDERS, CONTRACTORS, and OTHERS.

The above Council invite TENDERS for the REMOVAL of a BUILDING consisting of twenty rooms, hall, staircase, and passages, known as Hill House, situate at the corner of Ewell and Berrylands-roads, Surbiton Hill. The materials to be the property of the Contractor.

For further particulars and cards to view, apply to Mr. SAM'L MATHER, A.M.I.C.E., Surveyor's Office, Victoria-road, Surbiton.

Surbiton, July 1st, 1897.

## COMPETITIONS.

### TO ARCHITECTS.

The Urban District Council of Surbiton invite DESIGNS for New COUNCIL CHAMBERS and OFFICES proposed to be erected at a cost of £5000.

A professional assessor will advise the Council in the selection of designs.

Premiums of £30 and £15 will be awarded to the authors of the designs placed first and second respectively.

Printed conditions, with lithographed plan of site,

may be obtained of the undersigned upon a deposit of 10s. 6d., which amount will be returned on receipt of a bona-fide Design.

All Designs to be sent in not later than AUGUST 13th next.

JAMES BELL,

Clerk to the Council.

Council Offices,  
Victoria-road, Surbiton,  
June 30th, 1897.

**PARTNERSHIP** desired in a well-established Country Office by an ARCHITECT of many years successful town practice. Good air-ventilation. Coast preferred.—Box 518, Office of the BUILDERS' JOURNAL.

Price 3s.

**GLOSSARY OF TECHNICAL TERMS** used in Architecture and the Building Trades. By GAVIN JAMES BURNS, B.Sc., F.S.I.

Contains explanations of over 2000 terms.

London: E. and F. N. SPON, 125, Strand.

### CIVIL SERVICE TECHNICAL EXAMS.

—Preparation personally or by correspondence. Residence can be arranged if desired. Full particulars on application to Mr. A. H. HENTY, Perchard House, 70, Gower-street, W.C.

### SANITARY INSPECTORS' EXAMINATIONS.

—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by Correspondence. No books are required.—For particulars and testimonials apply CERTIFIED COACH, 31, Herbert-road, Plumstead, S.E.

### R.I.B.A. EXAMS. PREPARATION

personally or by correspondence. Any subject taken separately if desired. Exceptional arrangements for Resident Students. Architectural Lending Library. Catalogues 6d. each.—Apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to British Museum).

**MCNEILL'S FELTS**

(Roofing, Inodorous, Sarking, Dry Hair, Damp Course, etc.)

**MCNEILL'S SLAG WOOL**

(Silicate Cotton), for Fireproofing and Soundproofing.

AS SUPPLIED TO H.M. GOVERNMENT, WAR OFFICE, ADMIRALTY.

## WITHAM URBAN DISTRICT COUNCIL.

COLLECTOR OF RATES, SURVEYOR, AND INSPECTOR OF NUISANCES REQUIRED.

The District Council require a person to undertake the duties of the above-mentioned offices as from AUGUST 1st next.

Salary, £100 per annum.

The duties will embrace the making-out and collecting all the rates made by the Council, the performances of the duties of a Surveyor under the Public Health Act, 1875, and Acts incorporated therewith (including the management of the Highways and the Sewage Farm) and of an Inspector of Nuisances as prescribed by the orders of the Local Government Board.

The person elected must be competent to take levels, prepare plans, and supervise the erection of new buildings, and will be required to reside in Witham.

Security will be required to the amount of £300. Applications in writing, with testimonials, to be sent in to me, on or before FRIDAY, JULY 23rd.

By order,  
WM. BINDON HOOD,  
Clerk of the District Council.

Witham, Essex,  
June 29th, 1897.

## BOROUGH of SUDBURY, SUFFOLK.

**SURVEYOR.**  
The Town Council of the Borough of Sudbury invites APPLICATIONS for the APPOINTMENT of a BOROUGH SURVEYOR and INSPECTOR of NUISANCES, pursuant to the provisions in that behalf, of the Public Health Act, 1875, at a salary of £150 a year.

The person to be appointed is to devote the whole of his time to the service of the Corporation.

Applications, in the handwriting of the respective candidates, which are to state the ages of the applicants (not to be under 25 nor over 45 years), and their qualifications, and which are to be accompanied by copies of recent testimonials, not exceeding three in number (which will not be returned), are to be sent home at my Office, 16, Frear's-street, Sudbury, under cover, marked "Borough Surveyor," on or before TUESDAY, JULY 20th next.

The person appointed will have under his superintendence about ten miles of streets and roads.

An Office is provided for the Surveyor by the Town Council in the Town Hall.

Personal application to any member of the Council is prohibited and will render any candidate ineligible.

Dated June 23rd, 1897.

By order of the Council,  
W. BAYLY RANSOM,  
Town Clerk,

**DRAUGHTSMAN (experienced) WANTED**  
for architectural terra-cotta work.—Address by letter, stating past experience, to DOULTON and CO., Lambeth.

**WANTED, at once, competent ARCHITECT'S ASSISTANT.** State age and salary required.—Apply LANCASHIRE and SON, Hartshead, Sheffield.

**OFFICE (Furnished), 15ft. by 12ft., TO LET**  
in Victoria-street. Recently decorated, lavatory, splendid light; suitable for Architect or Surveyor. Use of Electric Light. £1 per week, inclusive.—Apply, YOUNG and Co., 12, Victoria-street, Westminster.

JULY 7TH, 1897.

## WORKHOUSE PLANNING.

(Continued from page lxxiv.)

By GEORGE H. BIBBY, F.R.I.B.A.

### VI.—SCHOOLS.

THE Local Government Board has published extracts from a memorandum entitled "Points to be attended to in the construction of Workhouse buildings." These have been published since September, 1891, and have been again issued lately, but the whole of the clauses from 51 to 67 have been omitted; these relate entirely to the construction of school buildings in connection with workhouses, and I have been informed recently, by a leading official of the Local Government Board, that at present no regulations as to the arrangement of accommodation for Poor Law children have been definitely drawn up or issued. It has long been considered desirable that the children of workhouse inmates should be separated very completely from all adult paupers; it is preferable that all such children should be boarded, housed, and taught in an entirely independent establishment of the nature of an industrial school. Where the workhouses are small, two or more Unions may unite to make such arrangements practicable and economical; in many cases, however, the workhouse children have been boarded and housed at the workhouse and taught with the children of national and other schools outside. This arrangement has very many disadvantages, and the most that may be said in its favour is that the cost of special school buildings and teachers is thereby not incurred. In connection with all large industrial or workhouse schools, it is desirable that there should be adequate provision for thoroughly isolating recent admissions, so that the children may not readily introduce infectious diseases, opthalmia, ringworm, &c., and where they may be placed under observation for the purposes of classification, that very objectionable children be not at once forced upon the society of others who have had some care and good training. Although in many instances the circumstances of an Union render it necessary that the children should be provided for at the workhouse, yet the school buildings should always be detached from all other portions of the institution as far as may be. The school buildings should be planned to contain children's dining-rooms, class-rooms, work-rooms for both sexes, also the dormitories and day-rooms. The latter should never be used for school or workshop purposes. The plans should provide for covered play-sheds sufficient for the whole of the children in wet or inclement weather, and there should be ample facilities for training both boys and girls to some useful employment—for the girls a well-lighted needle-room is very advisable, and there should be suitable rooms for tailoring, shoemaking, and other occupations. The Local Government Board require that all

work-rooms should be well lighted, warmed, and ventilated, and be sufficient in extent to prevent inconvenience by reason of the atmosphere being fouled by the materials employed in industrial training. The lavatory accommodation for the school-children should provide for a hot and cold water supply sufficient to enable them to wash thoroughly twice daily, care being observed that the same water be not used by two or more children, the lavatories should be so planned that the children may not be liable to get wet feet, and the fittings are best arranged when jets of running water are used instead of basins: it is desirable that during the winter months the lavatory should be supplied with hot water. The bath-rooms should be adequate for the bathing of every child at least once a week in winter and twice a week in the summer. The attention of the Local Government Board has long since been directed to the serious accidents which have occurred through the absence of proper regulations in workhouses and district schools for the bathing of the inmates, and have requested that special attention be given to certain requirements, amongst which the following have reference to structural arrangements. In the first place, the bath should be so constructed that the cold water may certainly be placed in the bath before the hot water. There are many special arrangements for this purpose, some of which are waste-preventing. Before any child or adult enters the bath, the official in charge of the arrangements should ascertain by a thermometer the exact temperature, which should be between 80° and 98° Fahrenheit. The bath-room should not be so small that it would be inconvenient for some paid officer or servant to be present to conduct the bathing. Every hot water tap should be provided with a key, which should be kept in the permanent charge of an officer of the workhouse, and may be entrusted temporarily to the person responsible for the bathing. During the bathing of children the schoolmaster or mistress or some trustworthy subordinate officer should always be present, and inmates should have the right to demand water which has not been previously used; therefore the capacity of the water tanks, both hot and cold water, should be regulated accordingly, and the most liberal supply of water that the district can afford should be secured. The baths should be of glazed fire-clay, and need not cost more than £5 each. In large establishments a swimming bath may advantageously be added, especially if so planned that it may be used alternately for both sexes. The depth of the swimming bath should not be more than about 5ft. at the deeper end and about 2ft. at the shallow end, with a bottom sloping gradually from end to end. The waterclosets and urinals should always be placed (as in other parts of workhouses) in an annexe, such as has been already illustrated in previous pages. This accommodation should be at the rate of not less than 10 per cent. of the boys, and 15 per cent. of the girls. This accommodation in connection with dormitories

should also be near to the sleeping apartments, but effectually isolated, as regards ventilation, by the narrow neck corridors already referred to. The children's dormitories require to have the minimum amount of wall spaces per head here given exclusive of door and fire spaces. If the dormitory be 15ft. wide, 4ft. per bed must be allowed, and if the dormitory be 18ft. wide then the wall space may be 3ft. 9in. In both cases, however, the floor area per bed must not be less than 36ft., and the cubic space 360ft. More than two rows of beds in the dormitories of industrial and other schools are frequently to be found, but are not by any means desirable. It has been suggested that the amount of spaces above mentioned might be somewhat diminished in those institutions "where the children are sub-divided into very small groups or families, as in the case of 'cottage homes' for ten or a dozen children, who may still further be sub-divided by placing four, five, or six children in a room," but as a general rule any such reductions should not be made unless under pressing circumstances, as the more liberal the areas allowed per bed the better must it be for the health of the inmates, whether officials or children. It is desirable that the site of the schools should be sufficient to afford ample space for playgrounds for children, having a sunny aspect, and, wherever possible, a piece of turfed or meadow land for outdoor exercise; and that it be where light and air can be freely admitted on all sides—these are points which have been insisted upon by the Local Government Board. The Guardians of the Poor of the parish of Birmingham long since adopted the system of forming large schools on the Cottage Home plan, and purchased a plot of ground at Marston Green, near Birmingham, of about forty-six acres in extent, and upon it built fourteen cottages (seven for boys and the same number for girls) each to contain thirty children; also residences for the superintendent and his assistants, workshops, store-rooms, school-rooms, a receiving or isolation ward at the entrance, a detached infirmary, swimming-bath. A considerable amount of land remained for cultivation both as a training ground and as an important source of food supply for the children. The industrial works of the children included needlework, painting, glazing, baking, carpentry, shoemaking, tailoring, tinplate working, gardening, &c. The sickness and death rates were found to be extremely small. It is desirable both for boys and girls that in the yards and play-sheds (or in rooms specially devoted to such purposes) there should be provided the means of physical training and exercise for the children, such as swings, parallel bars, ropes, and rings, and other gymnastic apparatus. The schoolrooms should be 18ft. in width, and not less than 12ft. in height, and afford a minimum floor-space of 9ft. for each child, exclusive of such space as may be necessary for purposes of access between the groups of desks, or such space as is from time to time required by the code of the Education Department. Generally the arrangements of the

school or class-rooms may be similar to those usually found in approved modern schools for children under the control of School Boards, and the Local Government Board has accordingly required that the desks should be so arranged as to afford a side light for the children, who should not be placed with their faces or backs to the light; the desks should be so constructed and arranged as to enable the children to work in unconstrained positions, and thus prevent weakness or distortions of the body after long sitting; the doors and fireplaces in schoolrooms should be so arranged as to leave the whole of one side of the room clear for the requisite seats and desks; where class-rooms are necessary they should be additional to schoolroom accommodation, and should be provided for about one-fourth of the children in the schoolrooms; they should be fitted up with galleries at right angles to the windows. The Local Government Board has stated that, in addition, to the necessary school, class, and work-rooms, there should be day-room accommodation of at least 10ft. for each child; the day-rooms being upon the ground floor, and possessing ready means of access to the playgrounds; they should have wood-block or boarded floors, and suitable arrangements for warming and ventilating at all seasons of the year. An important adjunct of a workhouse school for girls is the training laundry and washhouse, in which the appli-

## THE PRACTICAL DESIGNING OF IRON AND STEEL ROOFING.\*

(Continued from page lxxxiii.)

BY ALEXANDER DREW.

NO. VI. OF SERIES.

A WORD of warning might be given at this point, and that is, that if the arrangement (O) be chosen for a truss joint, it is desirable to make the junction-plates reversible, the holes being made symmetrical, so that should the workman reverse these plates while erecting the truss, no harm will be done. The last connection of this kind to be noted is that at (P), and is only suited for minor connections or small spans; the main tie is provided with an intermediate eye. The strut (shown here as T section) has part of the web notched away and the table kneed up, the vertical tie passing through these two members, and connecting all together by means of double nuts. In all cases where a joint of this kind is shown in text-books, the web of the T iron is indicated as bearing accurately on the main tie—in some cases it is carefully specified that such is to be the case—but in practice this nicety of finish cannot be ensured; the consequence is that this portion is either not bearing at all, or may be bearing so hard that when the joint

nected by a single bolt there. Should longitudinal ties be desired in this case, the plates may be made deeper, as shown dotted; the longitudinal ties being in this case provided with screwed ends and double nuts, and arranged zig-zag in alternate holes.

The last joint considered is that at the shoes. (S) shows a simple form of cast-iron shoe, the rafter drops into a notch in the same, and the main-tie is here shown with a jaw passing outside all; one single bolt being used to join all together. Such a type I would not recommend for anything but small spans (and to emphasise this the rafter is shown as of L section), although this exact form is shown in at least one text-book applied to a span of 85ft. For small spans a simpler shoe still is that shown at (T), this consisting of a short piece of T-iron bevelled off in the web, and connected to the rafter by two bolts; the main tie has a jaw at its end to connect it to this shoe; the whole is here shown as spiked done to a timber wall-plate. For larger spans another cast-iron arrangement is that shown at (U), the T-iron in the same way dropping into a notch, while a pocket is provided to take the eye at the end of the main tie. The same objections apply to a junction of this kind, as has already been noted with reference to the apex connection illustrated at (G), Fig. 31, and these need not be repeated here. Sometimes it will be noticed that this type of shoe is carried forward up the rafter as in the dotted lines, but this does not in any way improve the type. At (V) is shown a very good practical arrangement, and one that may be recommended in nearly every case for moderate spans. It consists simply of two kneed plates, shaped somewhat as shown, and bolted together with the rafter between same; the main tie may be either provided with a jaw and pass outside these plates, or with an eye and be set between; in this latter case it is likely that either packings would be required, or the plates would have to be joggled to provide room for the eye. A more elaborate, but no more efficient, wrought-iron or steel arrangement is that shown at (W), and consists of two shaped plates rivetted at bottom to a piece of T iron, this latter being in turn rivetted to a sole-plate, the rafter passing between the upper edges of the two plates, and is connected there generally by means of bolts; the main tie may be arranged as described for the last type. The last type illustrated is again that which should be taken as a warning; here the rafter of T section is turned downwards and then backwards in the manner shown; a plate is rivetted at either side of the web, and a sole-plate is also provided, to which the rafter end is rivetted. The difficulty and cost of turning round and welding up the rafter in this manner at once condemns such an arrangement, particularly when no benefit over that shown either at (V) or (W) can possibly be claimed for this. The main tie may be either provided with a jaw or eye, as in the last two cases.

Time will not permit of anything further being said with reference to iron or steel roof framework, and in conclusion we must turn for a little to the last subject noted for treatment—that of corrugated sheets.

Corrugated sheets, when used in constructional work, are almost exclusively applied in the form of covering to the roof or sides of a building. It is only with the former we have to deal here, but what is said with reference to this will apply almost entirely to the case of side covering as well. The thicknesses of these sheets are measured by what is called the "Birmingham Wire Gauge," where certain numbers represent a series of more or less arbitrarily chosen sizes; the larger the number the thinner the sheet. For roofing purposes these sheets vary from No. 16 to No. 24 gauge, or from about  $\frac{1}{16}$  in. to  $\frac{1}{8}$  in. in thickness; thinner sheets even than this, as No. 26 or No. 28, are frequently exported, but are made little use of in this country. No. 16 gauge is rarely used, No. 18 forming a very substantial covering indeed, while the more usual gauge is No. 20 or No. 22.

These sheets have so very little stiffness in themselves, that a considerable amount of framing is required if they are laid in this

Fig 32— JOINTS & CONNECTIONS.

ances, tables, and fittings should be constructed of a height to meet the requirements of girls undergoing training for domestic service, &c. For this reason hand appliances are desirable rather than machinery, and, in connection with these, airing-courts are by some authorities considered preferable to drying-closets, as being more in accordance with the conditions of private establishments, and the probable surroundings of the children in after-life. It is specially requisite that the playgrounds or courts for the children should have means provided for draining them in wet weather and for keeping them free from injurious dust during dry seasons; the playgrounds should be as pleasantly situated as circumstances will permit, and not be overshadowed by the workhouse or school buildings.

(To be continued.)

The first sod of the new waterworks at Midhope, on the South Yorkshire Moors, about ten miles from Barnsley, was cut recently. Parliamentary powers were obtained for the construction of the works after a prolonged and costly fight which ended in a compromise being effected between Sheffield and Barnsley. The selected site for the reservoir is at Hogg Wood, Midhope, where a natural valley provides an admirable spot. The engineer is Mr. Charles Hawksley. The estimated cost will, it is believed, reach nearly a quarter of a million.

is drawn up, the tendency is to twist both strut and tie; such being the case it would be distinctly better to cut the web away quite clear of the main tie, and thus get rid of difficulty or trouble which might arise here. If reference be made to junction (Q) on Fig. 32, a better arrangement of strut-end for a joint of this kind will be seen.

Passing to Fig. 32, the next joint indicated is that at the centre of the main ties, and only two examples of this form are given. At (Q) the main ties are provided with eyes, the struts have the web notched off and table turned up, while the king-rod is provided with a long screw and double nuts, the whole being connected by two junction-plates in the manner shown. Should it be desired to add longitudinal ties (that is to say, ties running from truss to truss throughout the full length of the building), it is only necessary to enlarge these junction-plates, say, in the manner dotted on sectional plan, and provide the longitudinal ties with plain eyes at the ends, which would slip between the two plates. (R) shows the same type of connection, but here the plates are vertical, and the king-rod is provided with an eye at its lower end, the struts are kept straight, but have the table notched off, are crossed at their ends, and con-

\* A lecture delivered before the members of the Edinburgh Architectural Association, and exclusively published in the BUILDERS' JOURNAL.

flat condition; but the almost invariable practice is to bend or set these in some manner to increase their stiffness. A considerable number of different methods have been suggested from time to time, but almost the only one in regular use now is that in which the sheets are corrugated, being stamped or rolled into a series of ridges or corrugations, running lengthwise, as illustrated in Fig. 33. The sizes in which these sheets can be got are more or less limited; the widths in regular use being 2ft. or 2½ft., while the lengths may be conveniently got up to 8ft. or 9ft., above this and up to a maximum of 12ft. or thereby, an extra price must be paid. The usual size of these corrugations are 5in. from ridge to ridge by 1½in. in depth for 16 and 18 gauge; while for 20 and thinner, and occasionally for 18 as well, the corrugations measure 3in. by ½in. deep. The width of sheets is measured from centre to centre of outside corrugations, and thus run in multiples of 5in. or 3in., 5-5in., and 6-5in., or 8-3in. and 10-3in. being the widths in common use. In laying such sheets the ordinary practice is to lap the edges one corrugation, as it is called (see Fig. 33), but if special weather tightness is wanted, or in some cases to secure extra stiffness, the sheets may be laid "double lapped" as shown. The end laps are usually 5in. or 6in., but might with advantage be increased should the slope be very flat, so as to check the tendency which the rain has to find its way up between the joints. The sheets are connected together by small bolts and nuts, or by means of light rivets and washers.

Fig. 33 shows two methods of laying; in the one the joints run in straight lines, while in the other the horizontal joints break with one another; the latter is frequently adopted where stiffness is aimed at, as in some special forms of curved roofs, otherwise there is not much to pick and choose between the two styles. In the same Fig. is shown one or two methods of connecting these to angle iron purlins; at (A) a hook bolt has its end slipped over the edge of the purlin, and the sheet is drawn down tight on same by means of a washer and nut; (B) is a distinctly better arrangement, where a special shaped clip is clasped round the purlin and bolted to the sheet. Sometimes the sheet has to rest on the edge of the purlin, as is often the case at the eaves of an iron roof; when such occurs the pair of clips shown at (C) and (D) may with advantage be used alternately; the former prevents the sheets from spreading, while the latter checks any tendency there may be for the sheets to rise upwards. (E) shows a single clip, on the same principle as that at (B). Should these sheets be laid on timber framework no difficulty need arise in fixing, iron spikes or screws being used. In all these cases of fixing no trouble whatever need be experienced in making holes for the bolts or spikes; the sheets are so thin in themselves that this may be readily done by means of a hand hammer and a punch.

Such sheets, if exposed to the weather for any length of time, would very quickly rust through, and they must thus be protected in some way. This protection may be got by means of a coating of paint or tar applied every few years, as might be found necessary; but a more usual method is that of *galvanising* the sheets. Here the sheets are first annealed (or heated to a red heat, and allowed slowly to cool), so as to render them soft and ductile, and are placed in a bath of dilute acid, so as to remove all dirt and scale, &c., from the surface; they are then washed carefully in water, and are finally passed through a bath of molten zinc, by which operation the surface becomes coated or covered over with this metal, and thus a very good protection is provided for the iron. Except in the very heaviest gauges, this galvanising is done before the sheets are corrugated. It is very desirable that all sheets be first carefully inspected before they are put through this process, to prevent trouble arising afterwards through any flaws or defects being temporarily hidden by this galvanising, only to be revealed at some later date.

There is one point which should be carefully considered when sheets are proposed as a roof-

covering, and that is the locality and circumstances under which they will be placed. Thus, in the neighbourhood of certain chemical works, or even gas-works, these sheets (particularly when galvanised) will sometimes be found to deteriorate very rapidly, owing to the acid fumes met with there. To overcome this an attempt has been made to supply leadcoated or *galenized* sheets, but this has not been very successful.

In all cases where sheeting is used, and particularly in such cases as those just noted, the sheets should be examined from time to time, so that any deterioration may be at once noticed and checked. In conditions unsuited to galvanised sheets, the best plan is to coat these with good paint, or some tar compound (in which case ordinary black or ungalvanised sheets may be used), and by renewing this coating as found necessary, a very good and lasting roof may be provided, suited to almost any circumstances. Under exceptionally favourable conditions these sheets have been known to last, without any material signs of decay, for many years, but such is not likely to be the case near any manufacturing town.

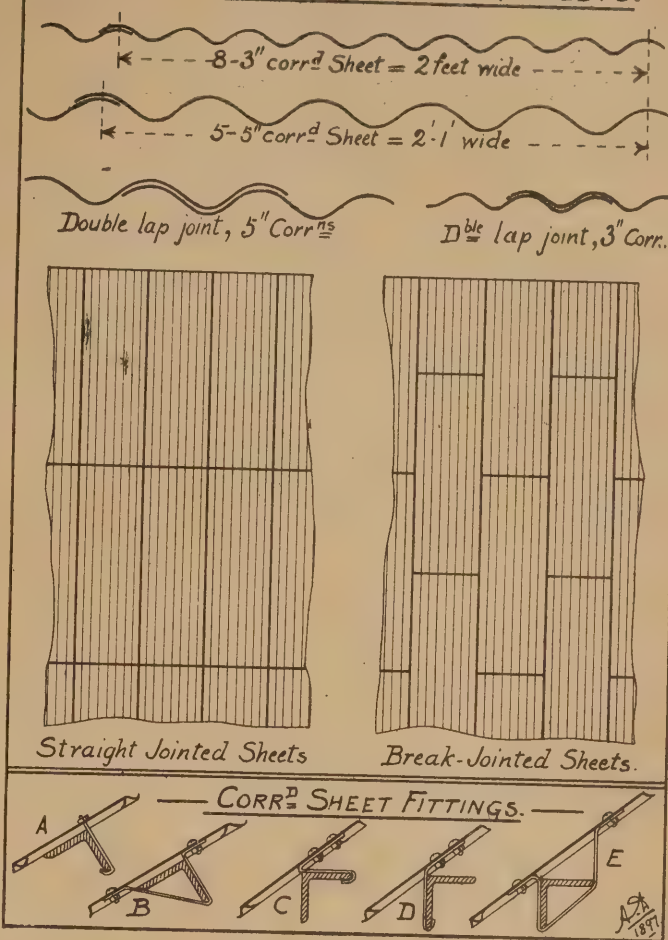

In concluding this series of lectures, I would earnestly impress upon all who may at any time be called upon to design such work as we have been considering, to keep the practical side of the question always before them. Theory and calculation will point to a particular section or scantling for each member of a roof-truss, while practice may often warn him that these same scantlings should be slightly modified to allow of their readier manipulation or handling, or it may be to permit of the bars being readily and cheaply procured.

Again, theory accepts almost any form of joint, so long as sufficient allowance has been made for the bearing and shearing stresses which occur there, while practice points to the adoption of the arrangement of joint which, while fulfilling the above-noted conditions, is at the same time the simplest and easiest to manufacture. In this, and in many other ways, practice will be found to govern or guide theory, while theory in its turn may help practice, to the mutual benefit of both.

In settling on the scantlings for any structure, do not forget the fact that iron and steel bars can only be had in a more or less limited range of sizes (and in this respect differ from timber, or the like material), and that in most cases no appreciable extra cost will be incurred by specifying, where necessary, a somewhat larger size than is required, so as to keep to some "stock" or easily-got size; considerable delay, and often additional expense, may be involved in getting delivery of odd or out-of-the-way sizes or sections.

It is also very desirable, while designing such structures or their details, to look at these things frequently from the point of view of the workman or engineer who may be called upon to produce the actual work; this will in many cases help the designer to avoid some of the pitfalls into which he might otherwise stumble, and will tend to ensure as a result an economical and practical structure.

Fig. 33.—CORRUGATED ROOFING SHEETS.—

I regret that time will not permit of anything being said on the question of the quality of the materials most suited for structural requirements, and the best manner of specifying and testing the same; but this is unavoidable in such a short course. For the same reason nothing has been said directly as to the strength of iron and steel purlins, and the like; the special arrangements which have frequently to be employed in finishing off the end of a roof, either when closed down to the square, or pavilioned; or when one roof mitres into another. The best method of providing light and ventilation in such roofs, particulars as to gutters and rain-water pipes, and many other points more or less directly connected with the designing of iron and steel roofing, have also necessarily been entirely passed over. I trust that what I have been able to bring forward may serve either as a means of refreshing the memory of those who have already studied the matter, or help those who may desire to take up this subject for the first time.

[FINIS.]

MESSRS. JAMES YOUNG AND SONS, since they obtained the contract, have lost no time in making a start upon the important works of the Talla Reservoir. The huts are being built of wood, with a felt roofing, upon the south side of the stream below the reservoir. Each is 112ft. in length by 24ft. in width, and accommodates eighty men. On the north side there will be a bakery, stables, and wooden cottages for the managers and inspectors, and there will be a small Church, and a club-house and recreation hall. The men are chiefly engaged in excavating for the puddle trench, which will go 70ft. below the bed of the stream, and is 22ft. in width. To enable them to get down with safety and without any risk of flooding, the contractors are pushing on the construction of a tunnel into which, when it is completed, the whole body of the water will be turned.

## COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
<b>BUILDINGS—</b>			
July 9	Brighton—Alterations, School of Art	Town Council	F. J. C. May, Town Hall, Brighton.
" 9	Bedminster—Stables, North-street	Co-operative Society	Society's Office, 160, East-street, Bedminster.
" 9	Harrow—Drying Rooms, &c.	J. Adamson and Co.	Johnstone Brothers, 39, Lowther-st., Carlisle, Cumberland.
" 9	Mallow—Piers, Gates, &c.	Guardians	Board's Engineer, Market-square, Buttevant.
" 10	Beetham—Alterations, &c., Vicarage		J. F. Curwen, Architect, Highgate, Kendal.
" 10	Burnley—Walling, &c.	Rural District Council	S. Edmondson, 18, Nicholas-street, Burnley.
" 10	Cardiff—Alterations, 52, Charles-street	Guardians	E. Seward, Queen's-chambers, Cardiff.
" 10	Dalton—Small Mission Church		E. A. Stockdale, Vicar, Dalton.
" 10	Londonderry—Six houses, Strand-road		W. Barker, 3, Richmond-street, Londonderry.
" 10	Leeds—Alterations, &c., Dewsbury-road	City Council	R. H. Townsley, Municipal Buildings, Leeds.
" 10	Leeds—Meter House, New Wortley Gasworks	Gas Committee	R. H. Townsley, Gas Offices, Leeds.
" 10	Rooksbridge—Chapel		E. W. House, Rooksbridge.
" 12	Boscombe—Bank Premises	Wilts and Dorset Banking Co.	G. M. Silley, 17, Craven-street, Strand, W.C.
" 12	Odiham—Schools, Bury Fields	School Board	Colson, Farrow, and Nisbett, 45, Jewry-street, Winchester.
" 12	Abertillery—School	School Board	G. Rosser, Victoria-buildings, Abercarn.
" 12	Southall—Public Offices, &c.	Urban District Council	T. Newell, High-street, Southall.
" 12	Bradford—Works, &c., for School, Sandy-lane	School Board	Peterson and Lawson, 1, Bank-street, Bradford.
" 13	Old Hutton, Kendal—Alterations, &c., Audland Park	H. A. Rauthmell	G. L. Hoggarth, Architect, Kendal.
" 13	Shap—Alterations, &c., Threaplands	T. A. Metcalfe-Gibson	G. L. Hoggarth, Architect, Kendal.
" 13	Bucklow—Taking Down, Erecting, &c., Footbridge	Rural District Council	J. M'D. McKenzie, 7, Market-street, Altrincham.
" 13	Ilford, Essex—Foundations of Lunatic Asylum	West Ham Town Council	L. Angell, Town Hall, Stratford, E.
" 13	Elgin—Alterations and Additions		C. C. Doig, Architect, Elgin.
" 13	Thornbury—Four Terrace Houses		Fairbank and Wall, Craven Bank-chambers, Bradford.
" 13	Malling—Alterations, &c., to Infirmary	Union	J. Ladds, 7, Doughty-street, Mecklenburgh-square, W.C.
" 14	Halifax—Mill, &c.	Guardians	C. F. L. Horstall and Son, Lord-street-chambers, Halifax.
" 14	Pontefract—Vagrant Wards, &c., Workhouse	School Board	Greaves and Co., Corn Market, Pontefract.
" 15	Barry, Wales—School Works, Palmerstown-road		W. H. D. Caple, 1, St. John's-square, Cardiff.
" 15	Leeds—Two Houses		Fred. Mitchell, Architect, 71, Albion-street, Leeds.
" 17	Arisaig, Inverness—Additions, &c., Hotel		D. Cameron, Architect, Inverness.
" 17	Penygroes—School		E. Evans, 8, Castle-street, Carnarvon.
" 17	Clown—Bricklayers' Work, Six Houses	B. Davies	B. Davies, Crown Inn, Clown.
" 17	Northumberland—Bath Rooms, &c., Lunatic Asylum	County Council	J. Cresswell, Moot Hall, Newcastle-on-Tyne.
" 19	Walsall—School, Croft-street, Birchills	School Board	Bailey and McConal, Architects, Bridge-street, Walsall.
" 19	Baslow—Twelve Cottages	Urban District Council	V. R. Cockerton, Clerk, Baslow.
" 19	Wimbleton—Stabling, Dwellings, &c.	Urban District Council	C. H. Cooper, Council Offices, Broadway, Wimbledon.
" 19	Chester—Restoration of Town Hall, &c.	Town Council	T. M. Lockwood and Sons, 80, Foregate-street, Chester.
" 19	Oulton, near Lowestoft—Annexe, Infirmary	Guardians	A. Clarke, 126, London-road, Lowestoft.
" 20	Salisbury, Wilts.—Engine House, Boiler House, &c.	County Asylum	Massey and Allpress, 25, Queen Anne's-gate, S.W.
" 21	Felixstowe—Shelter	Urban District Council	Town Hall, Felixstowe.
" 24	Bourton-on-the-Water—Hall, &c.		E. W. Kendall, Bourton-on-the-Water.
" 26	Goole—Extension of Boothferry-road Schools	School Board	W. B. Andrews, 24, Boothferry-road, Goole.
" 30	Crowborough—Residence, Workshops, &c.	Provincial Gas Works Limited	The Engineer, at Works, Crowborough.
No data.	Topping Fold, Lancs—Four Houses	Mr. Sand	C. H. Openshaw, Engineer, Fleet-street, Bury.
"	Clacton-on-Sea—Shops, Residences, and Stables		J. W. Martin, Station-chambers, Clacton-on-Sea.
"	Surbiton—Removal of Building	Surbiton Urban District Council	S. Mather, Surveyor, Victoria-road, Surbiton.
"	Grimsby—Business Premises	N. E. International Trading Co.	H. C. Scapery, Architect, Court-chambers, Grimsby.
"	Merthyr Tydfil—Fifty Houses, Pennydarren Yard	Building Club	Johnson and Williams, Architects, Merthyr.
"	Weside, Hereford—Shedding and Horse Boxes	Herefordshire Horse Show Soc.	W. T. Williams, 6, St. John-street, Hereford.
"	Middleton St. George, Durham—Asylum Buildings		J. W. Dyson, Architect, 67, Grey-street, Newcastle-on-Tyne.
"	Salisbury—Steam Laundry, Fisherton Asylum		F. Bath, Architect, Crown-chambers, Salisbury.
"	Yorks—Pair Semi-detached Villas, Sleights		J. Milligan, Architect, 77, Baxter-gate, Whitby.
"	Hurst—Six Houses, Queen-street		J. Hurst, Surveyor, 196, Curzon-road, Hurst.
"	Ikley-in-Wharfedale—Extension of Grammar School		C. H. Hargreaves, Architect, Exchange-buildings, Bradford.
"	Keighley—Additions to Park Works		Jno. Haggas, Architect, North-street, Keighley.
<b>ENGINEERING—</b>			
July 9	Barton-on-Humber—Puddled Tank, &c.	Gas Company	Company's Works, Barton-on-Humber.
" 9	Easingwold—Waterworks	Rural District Council	Clerk's Office, Easingwold.
" 9	Haslingden—Artificial Filter Beds, &c.	Sewerage Board	H. L. Hinnell, 41, Corporation-street, Manchester.
" 9	South Shields—Boiler and Mountings, Pump, &c.	Corporation	Borough Electrical Engineer, West Holborn, South Shields.
" 10	Buckfastleigh—Main Drainage Works	Urban District Council	J. Wilcocks, Surveyor, Buckfastleigh.
" 10	Cockett, Wales—Water Mains, &c.	Rural District Council	J. Thomas, 32, Fisher-street, Swansea.
" 10	Llansamlet, Wales—Water Mains, &c.	Rural District Council	J. Thomas, 32, Fisher-street, Swansea.
" 10	Walton-on-Naze—Extension of Pier	Pier and Hotel Company	W. Jaffrey, 3, Victoria-street, Westminster.
" 10	Wilton, near Lakenheath, Suffolk—Bridge	County Council	T. H. B. Heslop, County Surveyor, Norwich.
" 13	London, N.—Reconstructing Highgate Archway	London County Council	Engineer's Department, County Hall, Spring-gardens, S.W.
" 13	London, S.W.—Engines, &c., North Woolwich	London County Council	Engineer's Department, County Hall, Spring-gardens, S.W.
" 13	London, S.W.—Boilers, North Woolwich	London County Council	Engineer's Department, County Hall, Spring-gardens, S.W.
" 14	Gainsborough—Waterworks	Urban District Council	H. Riley, Council Offices, Gainsborough.
" 14	Maryborough—Weighbridge, Lunatic Asylum	Board of Governors	Chairman, Board of Governors, Maryborough.
" 15	Urfingford—Pump, Ballyphilip	Guardians	A. Cavanagh, Whiteswall.
" 19	Almaden, Spain—Boiler, Quicksilver Mines	Directors	Delegaciones de Hacienda, Barcelona.
" 19	Sunderland—Service Reservoir	Water Reservoir	Company's Office, Fawcett-street, Sunderland.
" 21	London—Extending Reservoir, Drain Pond, &c.	Metropolitan Asylums Board	A. and C. Harston, 15, Leadenhall-street, E.C.
" 21	London—Laundry Machinery	Metropolitan Asylums Board	A. H. Tiltman, 6, John-street, Bedford-row, W.C.
Aug. 28	Craiova, Roumania—Water Supply	Communal Council	Mairie, Craiova, Roumania.
" 31	Cairo—Iron Bridge	Ministry of Public Works	Inspector of Irrigation, 2nd Circle, Cairo, Egypt.
<b>IRON AND STEEL—</b>			
July 9	London, E.C.—Girder Bridges	South Behar Railway Company	Company's Office, 44, Finsbury-circus, E.C.
" 13	Oldham—Ironwork, &c.	Waterworks Committee	G. H. Hill and Sons, 3, Victoria-street, Westminster.
" 15	Valetta—Iron Joists		Crown Agents for the Colonies, Downing-street, London.
<b>PAINTING—</b>			
July 9	Sedgley—Painting, &c., Schools	School Board	S. Wilkes, Chairman, Sedgley.
" 10	Chorley—Painting, &c., Town Hall	Corporation	W. Leigh, Town Hall, Chorley.
" 12	Wainsgate—Painting Baptist Chapel and Schools		J. Judson and Moore, Architects, Oakworth, near Keighley.
" 12	London—Painting various Schools	School Board	Works Department Offices, Victoria Embankment, W.C.
" 12	Bradford—Painting, &c., Schools	School Board	School Board Offices, Manor-road, Bradford.
" 12	Salford—Painting, &c., Schools	School Board	School Board Offices, Salford.
" 13	Ipswich—Painting, Decorating, Schools	School Board	Board's Offices, Ipswich.
" 22	Surrey—Painting, &c., St. Saviour's Union	Guardians	G. D. Stevenson, 13, King-street, Cheapside, E.C.
" 26	Manchester—Painting Dwellings, Oldham-road	Sanitary Committee	City Surveyor, Town Hall, Manchester.
<b>ROADS—</b>			
July 9	Rochdale—Supply of Carnarvon Setts	Health Committee	Sanitary Works, Entwisle-road, Rochdale.
" 10	Eastbourne—Passage-way	Highways and Drainage Committee	Engineer's Office, Eastbourne.
" 10	Romsey—Hauling Gravel and Flints	Rural District Council	J. Allsop, Clerk, Romsey.
" 10	Sunderland—Whinstone, &c. (12 months)	Rural District Council	G. H. Humble, Council's Offices, Sunderland.
" 10	Fenton—Supply of Paving Setts (450 tons)	Urban District Council	S. A. Goodall, Town Hall, Fenton.
" 10	Leicester—Preparing, &c., Stone Sett Paving	Urban District Council	S. A. Goodall, Town Hall, Fenton.
" 12	Baldon—Supply of Granite (700 tons), &c.	Trustees of Wyggeston's Hospital	W. H. Woolley, Surveyor, Stapenhill, Burton-on-Trent.
" 12	Ebbw Vale—Improving Road	Urban District Council	H. E. Huggins, Clerk to the Council, Baldon.
" 13	Sedgley—Hauling Materials for Roads, &c.	District Council	T. J. Thomas, District Council Offices, Ebbw Vale.
" 13	Dover—Granite Spalls (150 tons)	Guardians	26, High Holborn, Sedgley.
" 13	Willesden—Road-making and Drainage	District Council	E. Carder, Union Offices, Dover.
" 14	Knaresborough—Street Works	Rural District Council	O. C. Robson, Public Offices, Dyne-road, Kiburn.
" 17	Luton—Supply of Slag	Rural District Council	R. Annakin, 44, Station-square, Harrogate.
<b>SANITARY—</b>			
July 12	Beckenham—Sewer (925 lineal feet)	Urban District Council	J. A. Angell, District Council Offices, Beckenham.
" 12	Holyhead—Sewerage Works	Urban District Council	J. L. Griffith, Clerk, Stanley House, Holyhead.
" 13	Norwich—Sewerage Works	Corporation	A. E. Collings, Guildhall, Norwich.
" 15	Wallsend—Scavenging, &c.	Urban District Council	G. Hollings, District Council Offices, Wallsend.
" 19	Walsall—Sewer, Rookery-lane	Rural District Council	T. T. Fisher, Leicester-street, Walsall.
" 21	Biggleswade—Sewerage Works	Rural District Council	The Surveyor, Council Offices, Biggleswade.

### Art versus Professionalism.

The election of Fellows to the R.I.B.A. is a question which has given rise to much excitement in that

august body. The two meetings lately held on this subject seem to have been quite animated. The Council, oppressed by the fact that the candidature for the Fellowship does not increase, or, rather, that it shows an alarming tendency to decrease, appears to have been tempted to resort to the methods of "a certain man" in the parable, who sent out into the highways and hedges to compel them to come in, that his house might be full. To this proceeding the Associates objected, as tending to lower the rank and dignity of the Fellow, and, consequently, that of the Associate. They had paid dearly enough for their privileges, such as they are; so why should others, no better than themselves, be put over them simply for the asking? Why should men who had tried to pass the examination, and had failed, be elected as Fellows, because they had been successful in obtaining commissions, and because they happened to have friends on the Council? This, though narrow, was what might have been expected; so it was not to be wondered at that when certain candidates, having failed to pass the examination, were put up for election as Fellows, the Associates should go down in a body and blackball them, so as to be on the safe side. The Council appointed a committee to consider the whole question; their report came before a Special General Meeting on May 31. To certain clauses of this report the Associates objected, particularly to one in which it was proposed to alter the proportion of votes necessary to election from four in favour of to one against—as it is at present—to two in favour of, to one against. This seems to have been considered as an attempt to make it more difficult to blackball any of the Council's candidates. It was strenuously opposed, and, after a heated discussion and an adjournment, was withdrawn. Another clause, empowering the Council to elect, without ballot, any member of an allied society who should be unanimously recommended by that society, was also strongly opposed but was eventually agreed to, with the added proviso, that his work should be of sufficient merit in the opinion of the Council, and that this rule should only remain in force for five years. The logic of all this is not quite clear. The Associates, as a class, have no objection, on principle, to the election of outsiders who have not passed the examination. They are willing enough to admit those they think desirable. If they made a matter of principle of it, and refused to admit anyone who had not passed the examination, their position, whatever else it might be, would at least be logical, and we could understand it. As it is, we have some difficulty in following them, and can only conclude that they differ from the Council as to which constitutes the necessary qualification of a Fellow; that they consider themselves better judges than the Council of the sort of man of whom the Institute approves. This seems a bit presumptuous; surely the older men, who have spent a lifetime in the Institute, would know its point of view better than the comparatively new comers? Where, too, is the logic in this? They do not think the Council good enough to judge

whether a man is fit to be a Fellow or not, but they are quite willing, and even eager, to get a sentence inserted in the bye-laws, whereby this same Council is made the judge of the merits of anyone proposed by an allied society—presumably as a check on that allied society—or else the allied society is supposed to be a check on the Council. This is naïve. As far as we can understand it, the whole body of the Institute elects a Council, as a head, to act for it and represent it; then proceeds to say that this head does not know what sort of man the Institute delights to honour. If the head does not know, surely the body does not; and if neither knows, who does? The Institute frames an examination,

ture really means. Is it simply because these men are clever in their own way, and successful; and that the Institute is more concerned with widening its own influence and power than with maintaining a high and correct conception of Architecture? We have heard it said that those represented by the Associates' Committee do not so much hold that the Council cannot be trusted to select the type of man that the Institute has been in the habit of honouring, but rather that the Institute has hitherto honoured the wrong type, and that this is their way of expressing their sentiments. We understand they would like to see some recognition given to Art. They hold that the man to be elected Fellow

OLD HOUSE, HIGH STREET, OXFORD. SKETCHED BY H. I. TRIGGS.

including those things which it considers generally necessary to salvation. Then it proceeds to express its willingness to elect, and we believe has elected as Fellows men who could not pass this examination, and would not if they could; and not only that, but men whose whole lives have been a standing protest against the views and doctrines of the Institute. Is this treating the examination seriously? We confess it puzzles us, and prompts us to ask whether the Institute has the courage of its convictions, or rather whether it has any convictions at all? Does it really believe in its examination? If so, why go back on it like this? Is it quite sure its conception of Architecture is the right one? If it is, why does it profess itself willing to elect men who think differently—men who hold that the Institute has no conception of what Architec-

should at the very least have some claim to be considered an Artist; or, in other words, that the Fellows of an Institute of Architects should be Architects themselves. Here is something even we can understand, and it strikes us as most reasonable, and the only wonder is that no one had thought of it before. After all, then, professionalism is not everything. Considering that an Architect is before all things an Artist, it certainly might not be a bad idea to include in an Institute of Architects just a few Artists, with a view to leaven the whole Institute. But a certain practical difficulty occurs to us. In these days, when the principles of Art have been scattered broadcast to the four winds of Heaven, when the frontier line between Philistia and Bohemia has been hopelessly effaced, who is to say whether such or such an one is an Artist or not? Are these half a

dozen men, even among the Associates themselves, who are agreed as to what Architecture is? Do they possess any standard of criticism by which they can judge whether a man is really an Artist, and a sufficiently accomplished one, or whether he simply fancies himself to be such? We have our doubts. But do these Associates seriously propose to themselves the Herculean labour of cleansing the Augean stable, of transforming the Royal Institute of British Architects into a Society of Artists? If they do, we admire their pluck, as they have a heavy task before them. But do they remember the ancient apothegm concerning an Ethiopian and a leopard? Have they considered whether the amount of energy necessary to this undertaking might be more profitably employed in another direction? Have they considered whether the thing is possible, and if possible, whether it is worth while? Do they realise, we wonder, that an Artist is one who follows Art as a religion, one who will only tolerate professionalism and worldly success in so far as they are consistent with Art; and do they equally realise that the Institute is a body that only tolerates Art, in so far as it is consistent with professionalism and success. Do they quite realise that an Artist is one who lives by ideas, who worships Nature and her principles, and to whom freedom is as the breath of his nostrils; and that the action of the Institute gives ground for thinking that it lives by opportunism and officialism—by formulas and conventions—that worships professional decorum and practical success, and that is clothed with respectability and routine, as with a frock coat and silk hat. All which things are worthy enough in their own proper places, but that place is not the Republic of Arts. How do they propose to reconcile these two attitudes, between which there is a great gulf fixed; nay, more—between which there is the same difference as between night and day, as between the truth and a lie. We ask them to consider this, and to face the situation squarely—to say whether they expect any success in attempting to mix water and oil. We see no chance here for a compromise, no chance to try and sit on two stools, or to serve two masters. There is no such thing as being "a bit of an Artist." Either a man is an Artist by the grace of God, or he is not. It is a circumstance over which he has no control. Whether he has followed Art faithfully and is an accomplished Artist, or whether he has followed after some strange God and is an ignorant one, is quite another matter altogether. Can a Society of Artists logically include men who are not Artists, though both put up buildings? Can a Society of Musicians include fog signallers, though both produce sounds? Can a Society of Whites include Blacks, even though they are all human beings together? If it does, it is no longer a Society of Whites, any more than the Institute can be a Institute of Architects if it includes men who are not Architects. This fact presents some difficulty to all those who attach any value to the meaning of words, and think it advisable that things should be called by their right names. If what we hear be true, and if the Associates' Committee really determines to see to it that Art be put first, and Professionalism be left to take care of itself; to insist, in season and out of season, that an Institute of Architects is by its name an Institute of Artists, and should be composed of such; to proceed to attain this end by a policy of pouring in water till the oil overflows at the top, their proceedings will be followed by every lover of Art with sympathy and interest. But if they are merely of opinion that Art might safely be patronised a little further without danger to the success of the Institute; that a little more Art might still be consistent with Professionalism and success; that the men elected as Fellows should take a little more

THE SUNDIAL, CORPUS CHRISTI COLLEGE, OXFORD. SKETCH BY H. I. TRIGGS.

interest in Art and know a little more about it, but not necessarily be Artists by nature themselves; if they think that by this means the honour and glory of the Institute might be enhanced in the eyes of the public, all we can say is that possibly it may be so, but that it is of no importance to any one but themselves, one way or the other. A society of professional men taking a more or less intelligent interest in Art is one thing, possibly a very useful thing; but a Society of Artists, producing Art and living for Art, is of a different order of creation altogether. To the Artist who must live an Artistic life by the law of his being—who is concerned before all things for the advancement of his Art; who is content to leave his reputation and ultimate success to the "perfect witness of all-seeing Jove"—it is of no interest or consequence whatever how far the Institute, or any other respectable society, is pleased to approve or disapprove of his Art, so long as such society has other interests which it continues to put before those of Art.

#### STREET PAVEMENTS.

THE number of letters appearing in a Newcastle contemporary has induced a correspondent to send a few notes generally on street paving. No good roadway can be made without a rigid foundation, the material with which the street is paved being merely the skin or veneer to preserve the real roadway—the foundation underneath. Modern experience has shown that the best foundation is one composed of cement concrete. Numerous qualifications are necessary for an ideal roadway, and an engineer must take many considerations into account before deciding upon the most suitable paving for different roads. These considerations are:—Impermeability (on sanitary grounds), durability, foothold, ease of traction, adaptability to all gradients, adaptability to all classes of traffic, noiselessness, non-manufacture of mud or dirt, ease of cleansing, ease of repairs, economical in first cost and maintenance, not influenced by climatic changes, and good appearance. All these qualifications have to be considered as well as the effect on the value of the surrounding property and business

interests. The pavements for heavy traffic from which to select are "granite setts," "wood blocks," and "natural asphalt."

#### THE GRANITE SETT PAVEMENT.

when of good quality, and well laid, has a longer life than any other, and costs less for maintenance. In Liverpool, where the traffic is very heavy indeed, the average cost of maintenance for four years was only one farthing per square yard, while natural asphalt cost nearly 2d., and wood 5d. per square yard. This kind of pavement is adaptable to most gradients, is suitable for all classes of traffic, is very durable, has fair foothold, gives easy traction, gives minimum of dust and mud, is fairly easily cleansed, and is fairly easily repaired. Its defects are that in certain conditions of the atmosphere it is rather slippery, and the noise is undoubtedly very great. This latter defect can in a great measure be overcome by using London and Hobbs's patent non-conductor of sound, which, although it cannot prevent the noise of the vehicle on the granite, prevents that unpleasant echo or reverberation of sound which is caused by the common practice of sweeping hard gravel, a conductor of sound, between the setts before the bitumen is poured in. The use of

#### WOOD PAVEMENT

has increased in a remarkable way during the last few years, no doubt in consequence of the superior quality of the Australian hardwoods, recently introduced into this country, and its noiselessness without the slipperiness of asphalt. It is noiseless, manufactures no dust in itself, offers very little resistance to traction, is fairly durable, is comparatively easily repaired, suits all classes of light traffic, has a good appearance, and is fairly easily cleansed. Its most serious defects are, that it offends more than any other pavement against public hygiene, and its cost of maintenance is very great. In Liverpool, wood pavement is laid instead of granite setts if the abutting owners prepay 60 per cent. of the estimated first cost of the wood, the Council undertaking to maintain it for ten years. Asphalt pavement nearly complies with all requirements, but unless kept scrupulously clean is at times very slippery. It is very easily cleansed, and is quite impervious.

## OXFORD.

ILLUSTRATED BY SKETCHES BY H. I. TRIGGS,  
J. HUTCHINGS, E. F. REYNOLDS, AND  
G. A. COX.

## PART I.

IT was from someone who knew intimately of the history, the traditions, and the academic life of Oxford that there came the fastidious complaint of Oxford being "so bitterly historical." The phrase must seem unjust to the majority of us, whether we know Oxford in fact or by hearsay only. Oxford has a pre-eminence in antiquity, and as we are wont to value and esteem, to closely cherish all those ancient signs and tokens which help us to link ourselves to our forefathers, to feel and think for a moment as they felt and thought, and the past history of our race: so should Oxford be most valued, most cherished, and most esteemed of us. People are apt to forget that the major part of the charm and beauty which appeal to them in the relics of antiquity—in the work of the hands and minds of men who belonged to a past epoch—is not so much interest in the thing itself as that it focusses on to the imagination the limitations, customs, ideals, and enthusiasm of those from whom we inherit our national prestige, whose experiences we profit by, and whose impulses are yet throbbing in our own veins. The day is not far distant when an omnibus, such as those now running on our streets, with its primitive harness and iron-bound wheels, and all splashed over with crude colours and painted letters, will be set in a museum, and regarded with the admiration and veneration of our descendants.

When above we alluded to Oxford as being pre-eminent in antiquity, we did so advisedly. It has certain characteristics which make it, with the sister University at Cambridge, unique in the British Empire. We must first remember that since a very early date, which cannot be exactly stated, but which may be fairly referred to the year 1100, the purpose and ambition of Oxford has been constant and unchanged. It is known that Master Puleyn began to lecture at Oxford in 1133, and it is not likely he would have done

so had there been no schools. Oxford also, by virtue of its high privilege as a centre of education, has found respect of Kings, Popes, and Conquerors, and it has been largely preserved from the eliminations, reorganisations, and renovations which characterise other places. Oxford has always been Oxford;

A DOORHEAD. SKETCHED BY J. HUTCHINGS.

and it may be assumed that 400 years ago its University was of greater significance than it is now. In the reign of Henry III. there were 30,000 students. So it is that very little has been removed to make place for new. The Colleges venerated their traditions. One thing has grown and developed from another, till now we find in Oxford, and in its Architecture, and its régime, anomalies and anachronisms bunched together; and through and over this history has marked its epochs in stone walls, and in college phrases and customs, so that he who can read these signs and tokens may indeed feel and say, if he be so minded, that Oxford is "bitterly historical." In Architecture we may trace from the Old Castle and the Cathedral, Merton and Magdalen, to Jacobean Oxford, all crumbling and lichenized, and crowded with thousands of noble associations, and the names that have distinguished our country. At St. John's and Queen's we are reminded that even such modern names in the history

of Architecture as those of Inigo Jones and Wren are beginning to fade into the dimness of history along with those of William of Wykeham and William de Waynflete, for the Jones' Colonade in the inner quadrangle of John's is crumbling badly, and the noble front of Queens (which, however, is actually the work of Hawkesmoor, though suggested by Wren) is scared by the weather, and the forms of the carving are growing blurred and merged together confusedly. And so may we trace out, step by step, the history of Oxford in its stones, through Thomas Dean's University Museum, inspired by the writings of Mr. Ruskin, the Balliol scholar, through the work of the revivalists to Mr. Waterhouse's Balliol front, and to Mr. Jackson's new schools, Mr. Bodley's perfect and inimitable compositions in the style of the fourteenth century Oxford traditions, down to Mr. Hare's Municipal Buildings, which stand within a stone's throw of the old Carfax tower, as though a cycle were completed and the last were linked to the first. And that such a cycle never is, and never can be complete, that the future is always treading on the heels of the present, and the present is, even while we notice it, ticked off as belonging to the past, is the bitterness of the historical side of Oxford. This merging contrast of old and new is emphasised by the electric lighting which has displaced gas in the main streets of Oxford. One feels it was an obtuseness of sentiment and feeling, a very instinct of the vandal, that prompted such usage. Now, from the Carfax to Magdalen, and upon Balliol and John's, electric light flashes, and a tram jangles up and down before them. The old Colleges shrink away and stand alone with their solitary, solemn past, and the life of the place, with its hopes, and ambitions, and despairs, circles and hop round and within their walls. And if the varying forms of Architecture can so solemnly impress us with the ineffable sadness and awesome solemnity which are awakened in us when we are confronted with the relics of the past life of our race, how strongly must this be impressed upon the thoughtful within the University itself, when every custom of the invoked régime and discipline of the Colleges has its tradition, and to those who care to know, a special significance as being a heritage from the dead past,

WORCESTER COLLEGE, OXFORD. THE OLD BUILDINGS. SKETCHED BY H. I. TRIGGS.

THE QUADRANGLE, NEW COLLEGE, OXFORD. SKETCHED BY H. I. TRIGGS.

when other religions and aspirations were the living impulse of the 'Varsity. We have said that Conservatism is characteristic of the Academic mind, not to annul and reorganise, but rather to retain traditions, and modify them to the changing needs. We may, in illustration of this, refer to the ceremony known as Collections. The function has been thus described by Mr. Andrew Lang: "On the last day of term, undergraduates are called into the Hall, where the Master and the Dean of the Chapel sit in solemn state. Examination papers are out, but no one heeds them very much. The real ordeal is the awful interview with the Master and the Dean. The former regards you with the eyes of a Judge, while the Dean says: 'Master, I am pleased to say that Mr. Brown's papers are very fair, very fair. But in the matter of chapels and of catechisms Mr. Brown sets—for a scholar—a very bad example to the other undergraduates. He has only once attended Divine service on Sunday morning, and on that occasion, Master, his dress consisted exclusively of a long great coat and a pair of boots.' After this accusation, the Master will turn to the culprit, and observe, with emphasis (ill represented by italics): 'Mr. Brown, the College cannot hear with pleasure of such behaviour on the part of a scholar. You are gated Mr. Brown for the first fortnight of next term.'" Now this ordeal, with its strange appellation, is merely a survival of an obsolete custom relating to the collection of the College dues. This duty is now performed by the bursar at the beginning of each term, but in 1331 it was ordained that all Masters of Arts should personally collect their salaries from the scholars, and this was done at the end of the term.

The early history of the University is replete with a fascinating interest, but it is rather with the Architecture of the city that we are here concerned. The story of the early struggles with the Jews, the Friars, the Papal Legates, and, above all, with the town, which it is to be remembered was a flourishing commercial centre, with moneylenders and trading barges on the river before the University acquired any privileges, or, indeed, property. It was not till the thirteenth century that the University may properly be said to come into existence. It was only then that she gained to the possession of rents and common funds, and that benefactions were contributed and endowments made. From that date her power grew, chiefly by the support of the Monarch and the Papal Courts. One of the earliest tokens of the growing prestige and importance of the University were the assignation of fines. The earliest of these seems to have been paid by the townspeople of Oxford over the matter of the hanging of two clerks. The town had hanged these clerks, or scholars, of the University, and had to pay no less a sum than 52s. by way of compensation. In those days every clerk seems to have been equipped with bow and arrows, and dagger; and with perhaps a buckler to ward the weapons of his adversaries; indeed, even as in Monmouth's day, the University contributed a useful body of archers in the unfortunate cause. It was, however, in broils with the town, or more rarely with a rival College, that these weapons came into play. The "Town and Gown row" is by no means a latter-day invention, the game was played with more serious issues five hundred years ago. One may remark that even in the fourteenth

century the saying that "boys will be young men" was as true as it is in Oxford to-day, whether it inspires dawning manhood to ram plate-glass windows in the "High" with a ladder, and be fined in the Chancellor's Court therefor, or to abuse the wine at the Swyndlestock Tavern in Carfax and break the head of the vintner with his own tankard on his own threshold. This is what happened on the feast of St. Scolastica in 1354, and led to a town and gown row, such as the most hot-headed undergrad. dare not hope to provoke in these days. In ten minutes the town bell was set ringing in St. Martin's Tower, the Chancellor answered with the bell of St. Mary's, and shooting commenced. It was only at nightfall that the ranks of the town, strengthened by their friends from the country outside the gates, drove back the clerks to their colleges. One regrets that the town should have resorted to the scalping of sundry of the defeated scholars. Perhaps it was in consideration of this painful indignity that the final result of the whole matter was the conferring of many liberties upon the University by Edward III. This indulgence—for in point of fact many of these newly conferred rights had been taken from the town—indicates the recognition of power and consequence he accorded to the University.

It is with the Architecture of the city, however, that we are now in chief concerned. Oxford is full of fine Architecture, which is not merely manifested in its edifices of importance or magnificence, but in all the ramifications and humble outbuildings of its numerous Colleges. We are speaking, of course, of mediæval Oxford, but there is very little of bad Architecture, old or new, in Oxford, and among the modern collegiate buildings the only designs that can be termed bad are those erections of the days of the Gothic revival, and from these blots Oxford, happily, has largely found exemption. In our own day Mr. Bodley, Mr. Jackson, and Mr. Champneys have all contributed to the dignity and beauty of collegiate Oxford, and Mr. Hare, on behalf of the town, has, in his municipal hall, raised a building which, besides its great merits of design has, in point of style, exactly achieved that happy balance of old and new, which will allow his building forever to stand in mediæval Oxford, unchallenging and unchallenged of the College buildings, while, at the same time, it can never be attributed to any other date than the end of the nineteenth century. We find also a further gracefulness and charm in this beautiful city. If the College buildings could cease to have any existence, Oxford would still be one of the most picturesque and romantic of English towns. The unequal, irregular streets are flanked by houses that have stood, as they stand now, beside the Colleges for centuries. There were the unpretentious homes of the townspeople in times gone by. Some are simply plastered, some have carved bargeboards, a few gain an effect of richness with half-timbered fronts, but all and each achieve some simple Architectural effect, in superimposition of dormer over bay, or some picturesque grouping and emphasis of the window openings upon their narrow frontage. The characteristic feature in these humble dwellings is the oriel. Nearly every house is plastered white over a timbered construction, and the oriels and bays break out upon every conceivable curve and angle into hexagonal, octagonal, square or segmental projections in fancy-free variations and combinations, and besides effecting a variety of interesting and often felicitous designs, and expressing them with a precision and completeness that is fascinating, show to the passer-by along the curve of the street a broken vista of oriels, eaves, dormers, and corbelled gables which could hardly be anywhere matched for picturesqueness. And it is in this setting that the contrasting richness of the gray, time-worn Colleges are viewed. Their lichened, crumbling stone fronts stand, for the most part, sandwiched between all this broken picturesque jumble of white plaster and wood. It is in this particular that Oxford is in chief distinguishable from Cambridge; at the latter the University buildings, or

"backs," stand in one part, aside from the town. Comparisons are for ever being made between the sister 'Varsities, which are, in truth, rather wearisome. There are, however, one or two Architectural features which are distinctly associated with one or the other. It seems curious, for instance, that the Oxford Gate Tower should be characterised by a single angle turret, while that of Cambridge always has two, thereby achieving symmetry for its elevation. The great Coat of Arms decorating the spandril, formed by the label of the archway and the string above, is particularly a Cambridge feature. Those who have visited Cambridge cannot fail to have been struck with the richness and skill with which these scutcheons have been wrought over the entrance gateways at Christ's and St. John's Colleges.

In the continuation of this article we shall

### ON FLOORS AND THEIR COVERINGS.

BY WM. NORMAN BROWN.

PERHAPS in no other portion of our houses and their furnishing have greater changes been effected of late years than with our floorings and their coverings. While some generation or so since it was the custom to cover the whole floor space—possibly because of the ugly and ill-fitting boards—with a Turkey, or Brussels, or a Kidderminster carpet, or if more refined somewhat, having the space around hidden with floorcloth—this, usually, with the carpet, having horribly inartistic and crude patterns thereon, totally out of harmony with the furniture and their general surroundings—now it has become the custom in town, suburbs, and country alike, to have,

For pine floors a first-class stain consists of a saturated solution of permanganate of potash, which will give a more or less deep colour, according to the strength; when varnished with shellac dissolved by heat in alcohol, a rich walnut colour will be the result, or with a weaker solution and copal varnish, oak stain will be obtained. Other stains can be purchased, or made according to recipes. In the West of London there is a colony, given over rather to æstheticism, in which the houses were designed by Mr. Norman Shaw, and are for the most part comfortable, although æsthetic. It is not, however, with the colony, known as Bedford Park, the Architect, or the exterior of the houses that I have to do on the present occasion, but rather with the decorative interiors of some few over which I have recently rambled, and which are characteristic

AT MAGDALEN COLLEGE. SKETCH BY H. I. TRIGGS.

deal more particularly with the various Oxford Colleges.

ONE of the chief features of the Jubilee celebrations at Gravesend was the unveiling of a statue of the Queen, which the Mayor has presented to the borough. The statue has been erected outside the Technical School.

A BILL has been brought in by Mr. Jesse Collings and the Home Secretary to confirm a provisional order made under the Housing of the Working Classes Act, 1890, to enable the London County Council to clear and acquire a site of about 9000 square feet in the most congested part of Southwark, off the Blackfriars Road, and at no great distance from the Peabody blocks. The boundaries of this area are Pocock Street, on the north-west; Green Street, on the north-east, vacant land, on the south-east, and Board school buildings, on the south-west.

T T

in the better class of residences, the floorings either stained, painted, or grained, or, what is far better, hygienically and artistically, to have them laid with a well-fitting parquet. These are among the best of the modern furnisher's resources, and there are such a variety of makes upon the market that he must be hard to please, indeed, who cannot be suited. Further to these I shall not refer, but to those to whom parquet wood flooring is an impossibility, I would remind them that some very pleasing effects can be obtained from stains, particularly if the boards have been laid down in narrows. Thus a good effect can be procured by getting a light and a dark stain, and after preparing the woods by planing, sand-papering, &c., using them alternately on the boards, while another pleasing variety can be imparted by mixing equal quantities of the two stains together, and employing a third shade on a third board, &c.

of those all over the Park. In one the doors and woodwork were painted a pale grey blue, with flooring of a dark oak stain, varnished; the external sides of the doors, with the accompanying woodwork of passages, landings, and staircase of a dark chocolate colour, painted and varnished. Along the hall and staircase was an art varnished dado; but in one house an exception had been made in having this of Indian matting, stretched and fastened on with a neat beading, painted a pale sea green in harmony with the rest of the woodwork, the inner panels of the doors here being adorned with a spray of wild flowers on each, which stood out well from the sea-green background. For morning and sitting rooms and boudoirs this style of decoration is particularly appropriate. Other houses in Bedford Park, particularly if the panelling is of a pale dull brown—a mild terra-cotta, in fact—have the floor spaces around the art carpets or

centre rugs painted a brilliant white, much after the style of enamel, and if Liberty silks are employed in the wall decorations, and the furniture is *en suite*, the effect is charming. Many of our younger Art workmen would gain a valuable object lesson in decorative work by a ramble over a few of the Bedford Park houses when opportunity presents itself. Quitting Chiswick, I may mention that some time since a mansion in Eaton Square was decorated under the ægis of one of the sisters Crommelin, which house now ranks among the prettiest in London. The drawing-rooms are in plain white woodwork, with panels of pale sage-green silk let into the wall; between the two drawing-rooms are Eastern arches, and behind these is a small recess, having a white dado, and above it a Japanese paper with a cream-coloured ground, and bearing rose-coloured jasmine upon it. The ceiling is papered in the same colours, but the design is different, the rose-hued jasmine assuming somewhat cloud-like shapes. The dining-room has been furnished in crimson and white, the *motif* being thus preserved, having a high white dado and crimson paper, while the space usually occupied by folding-doors has in lieu a white Cairene gate of open Musbarabiyeh work. Another house, for the decoration of which the other Miss Crommelin was responsible, and situated in Wimpole Street, will be found rich, quaint, and somewhat unusual. Here the entrance hall, which it is the fashion to have totally distinct from the staircase, is panelled with oak, having let in panels of a splendid dark Rose du Barri and dull gold paper. The curtains are of brocade of the same colours, consisting of a double tapestry, and, when hung, have the appearance of being entirely woven by hand. The staircase is a very gay affair, the paper being a brilliant French one, having a pale cream ground, with a large, easy pattern of a rose-tree branch with a bird perched thereon. At irregular intervals a peacock, almost life size and gay in Nature's plumage, appears, standing also upon a branch. The drawing-room is decorated entirely in yellow, having curtains of a pale, soft colour, with a shot pattern thereon, ranging from

yellow to terra-cotta. Each chair and couch in this *salon* has been upholstered in a different colour, material, and pattern, but all are soft semitones. In the bedrooms, all those on the first floor are coloured alike, papered with pale pink carnations, of a deeper tone, and approaching to Rose du Barri, with green leaves mingling. In another set the bedrooms are papered with a quaint old English design of small, irregular terra-cotta flowering on a cream ground, the curtain being old English in design, with a conventionalised, indescribable flower pattern in grey on a terra-cotta ground. The boudoir is papered with pale, soft, willow green, having above that a white frieze with pale pink tea-roses all over it, the ceiling being in pale green also, with soft pink flowers scattered over it irregularly, the effect, with the dark terra-cotta chenille curtains, being simply harmoniously magnificent. To revert, however, to the immediate subject of this article, flooring, I may mention that painted floors, carried out decoratively in two or more colours, and in imitation of the inlaid woods found in ancient French houses, is especially satisfactory. A good design consists in having large octagonal blocks, enclosing a star radiating from the centre, where it commences as a small figure, formed of eight diamond-shaped blocks in two shades of yellow; from these other diamonds of chocolate, outlined with black, continuing thus to radiate in two rows of lighter shades of Indian red until blocks 3ft. in diameter are formed, the spaces between being filled with yellow blocks. The line of octagonal figures outlined with black and Indian red is edged by a band of yellow 6in. in depth, and bordered with a line of black, 1in. wide, and one of red, 3in. in width. The octagonal blocks extend in one uniform line, the triangular spaces formed between being filled with yellow and black stripes. If the aid of stencil-plates is called in, such designs can be very effectively and simply worked up. A very good and decidedly handsome border for a flooring can be obtained by painting the boards a pale cream colour, putting on two coats, then upon this

painting a serpentine line, 2in. in breadth, the half-circles being 12in. in diameter, and cut from paper, then in each semicircular space stencilling in some appropriate figure, using a paper pattern, and taking care to well fasten down the edges before working in. Then around this design on the ground apply one or more coatings of black paint, and when dry a coat of copal varnish, then rub

SKETCH BY J. HUTCHINGS.

off with pulverised pumice stone, rinsing off thoroughly before the pumice dries. Then if it is desired to be highly polished so as to imitate ebony, this varnishing, &c., will have to be completed several times until a perfectly dense hard finish has been obtained. Wet the paper-stencil designs to lift them off, and with a small sponge wipe off all paste, &c., when the result will be a very good imitation of inlaid flooring. A very handsome flooring can be obtained by employing stencil plates cut with blocks of various forms and sizes, then painting in with stains in imitation of inlaid blocks of walnut, oak, ebony, cherry, &c., with small blocks of enamelled cream-white, as near like ivory as possible. Thus an ebonised ground, with comparatively small figures in white, such as a conventionalised flower or geometrical pattern, will appear more like genuine inlaying than a diffuse and bold application. Where the very pleasing and beautiful plan of a central carpet with a border of natural wood or tiles, or their imitations, is adopted, a very good effect can be procured by painting, some three or four feet from the subbase, the floor in some colour contrasting with that of the walls and harmonising with the woodwork. A rich brown, warmed with red or Indian red, a chocolate, a rich deep-toned oak, or some of the buffs—*café au lait* or citrine—are all good colours for such purpose, and enable the employment of pretty rugs, thus permitting the furniture, which in these days is decidedly of the miscellaneous and *bric à brac* order, to be shown off to the greatest advantage. A carpet, to be perfect, should be soft of texture, rich in appearance, and "blowey" in effect—that indescribable effect which is observable in a field of breeze-blown corn—these results are the best attained in Oriental carpets and rugs. It must always be borne in mind by the artistic decorator that the carpet must form a suitable ground upon which furniture and other objects placed upon it are to stand in harmonious conjunction or pleasing contrast, while its character should also accord with the general surroundings. While hangings, wall decorations, furniture, and ornamental additions may be low in tone and delicately manipulated, a carpet should be full, rich, and deep, "glowing, radiant, or bright, as opposed to dull, quiet, or heavy," and having a predominance of bright and warm colour rather than of cold and neutral tints. The practice of covering up the entire flooring right up to the base of the skirting

IFFLEY CHURCH TOWER. SKETCH BY E. F. REYNOLDS.

board, leaving no trace of the floor material, is contrary to the first principles of Decorative Art, which strictly requires that the nature of the construction, as far as possible, should be always revealed, or at least indicated, by the adornment which it bears. I cannot do better than close my first article with a couple

decorated with flat ornament, *i.e.*, with designs which either represent a flat surface or whose handling is flat. This does not preclude the employment of fruits, flowers, leaves, and arabesques: it only requires that they should be treated flatly, being somewhat like plants in a herbarium, and not in relief, with effects

aspect from all points of view. Taking my other authority, Sir Digby Wyatt, he, in a report on the subject of floors, &c., says: "The moment one is impressed with the idea of walking or sitting upon what no person in his senses would think of walking or sitting upon, a painful sense of impropriety is experienced,

MAGDALEN COLLEGE, OXFORD. SKETCH BY G. A. COX.

of quotations. In a small German essay by Karl Krumboltz, and entitled "Made-Over Princess," the following sentiments respecting the true principles of design and colour regarding floor-decoration are worthy of remembrance: "In general little or no attention is paid to the law that the flat surface should be

of light and shade. This principle is applicable to the decoration of floors, walls, woodwork, tapestries, carpets, and furniture." According to this treatise, a flat surface, as that of a floor for instance, should be decorated with a symmetrical flat pattern throughout, which will give it a quiet surface, and present the same

proportioned in intensity to the vivacity with which this misappropriation of judicious design is expressed in the fabric."

THE Heckmondwike District Council has decided to apply for powers to borrow the money necessary to build public baths.

## CHATSWORTH HOUSE.

## VISIT OF THE SHEFFIELD SOCIETY OF ARCHITECTS.

EACH year it is the practice of the members of the Sheffield Society of Architects and Surveyors to journey to some notable place, and combine pleasure with instruction. This year Chatsworth House, one of the princely houses of the Duke of Devonshire, was selected, and the excursion recently made was one of the pleasantest ever held under the auspices of the society. Owing to the recent holidays the attendance was not so large as usual, but amongst those who took the trip were Messrs. Joseph Smith, vice-president; C. J. Innocent, hon. secretary; T. H. Waterhouse, Benjamin Bagshawe, E. M. Gibbs, W. J. Hale, H. Webster, J. Norton, J. T. Cook, A. H. Holland, C. F. Innocent, J. C. A. Teather, T. Myles, L. D. Hemsoll, W. Denton, F. J. Innocent, C. F. Bond, T. H. Robinson, and F. Wilson. Mr. R. W. Fowler (the president) and Mr. F. Fowler (the treasurer) wrote regretting their inability to attend. The Duke of Devonshire placed the whole of Chatsworth and its grounds at the disposal of the members, and there was no check whatever upon the party seeing anything that could interest them as professional men and lovers of all that is beautiful and rare in Art. Mr. Gilson Martin, F.S.I., his Grace's steward, met the members at the main entrance, and accorded them a hearty welcome. Mr. B. Bagshawe, who is a "lay" member of the society, was appointed cicerone. He has a rare knowledge of Chatsworth, of its history, its architecture, and its many treasures, and was able to conduct the party to places of the deepest interest to them. He was ever ready with explanation, suggestion, and reminiscence. Peculiarities of the stonework at the entrance having been commented upon, a visit was made to that portion of the house usually shown to the public, and here there was much to admire, though, to many, the sights were no new pleasure. The members were then privileged to visit

## THE LIBRARY.

A long stay was made here, and among the numerous valuable books examined were Claude Lorraine's "Liber Veritas," several of the famous Inigo Jones' sketch books, one including a diary of his stay at Rome, and another containing many exquisite designs—some coloured—for masque costumes, &c.; early Caxtons, and the first book printed in the English language, valuable illuminated books, a curious volume of surveys of the Cavendish estate at the end of the sixteenth and the early part of the seventeenth century, early plans of Chatsworth House, and sketches and manuscript memoranda of Watson, the person principally engaged on the carved stone and woodwork at Chatsworth at the end of the seventeenth and the beginning of the eighteenth century. Leaving the library, the grand suite of private apartments was traversed, and an opportunity was given of examining the magnificent works of Holbein, Tintoretto, Rembrandt, and other great Artists of their time. There were also some charming pictures by Reynolds, Lawrence, and other masters of the English School, exquisite wall and ceiling decorations, beautiful wood-carving, and rare china and curios. A move was made for the two galleries containing the most valuable collection of original drawings by

## OLD MASTERS

in the possession of any private individual. None of the great Italian, German, Flemish, French, Venetian, Spanish, and other Schools are unrepresented, and the drawings were a revelation to most of those present. Amongst them are the works of Raffaele, Michael Angelo, Rembrandt, Rubens, Leonardo Da Vinci, Poussin, Claude, Salvator Rosa, Correggio, Luca Signorelli, Vandyke, and many others. The drawings, of course, are not of large size, and the two galleries are filled with them. Hours would be insufficient to make a real inspection of the grand collection, and it would take days to observe and study them as they deserve. The late Mr. Reid, of the British Museum,

made a careful catalogue of the collection in recent years, and many of the more valuable drawings were autotyped years ago by Messrs. Brawn, of Paris, from whom facsimiles are still obtainable. Among other rooms visited were two private ones, containing a collection of exquisite water-colour drawings, principally beautiful examples of David Cox and William Hunt. The famous

## SCULPTURE GALLERY

also proved most interesting, and afterwards the gardens, with their many artificial wonders, and the electrical apparatus, for which water power is utilised for lighting the whole of the house, were examined. The fountains, including the Emperor, which throws a jet of water 270ft. high, were playing in honour of the visitors. There was a long discussion regarding the exterior of the house, and the cheap rate at

## ADDITIONS TO THE MONT BLANC OBSERVATORY.

THE first station placed upon the rock of the Bosses consisted of only two rooms. The new structure, which has been put together by Mr. Vallot, is simply amazing, situated as it is at an altitude of 14,360ft., well equipped, and scientifically arranged. The old station measured 16½ft. by 10ft., and was divided into two rooms, one of which was used as a refuge to travellers, and the other being used as an observatory; but modest as its dimensions were, it was of the greatest service to science and scientists. A few years later Mr. Vallot enlarged the observatory by adding four rooms to it, and since 1892 three other rooms have been built. The habitability of the structure is now perfect, even during snowstorms. A stone wall surrounds the edifice and embraces

MAGDALEN TOWER, OXFORD. SKETCH BY E. F. REYNOLDS.

which much of the beautiful carving was executed. The tour concluded with a visit to Queen Mary's Bower, and many were the opinions hazarded as to the time of erection and object of the strange, moat-surrounded building. No satisfactory conclusion was come to, but there was general agreement that the building was erected before the time of Queen Mary. A welcome break had been made in the sculpture gallery, where the vice-president, Mr. Joseph Smith, proposed a vote of thanks to the Duke of Devonshire for the privilege he had accorded the members, to Mr. Gilson Martin for his kindness in personally conducting the members through the house, and to Miss Martin for the manner in which she had placed the treasures of the library at the disposal of the visitors.

the stanchions, the ice constituting between the stones a cement of extreme hardness. The board walls are everywhere double, with a mattress of air between them, thus assuring a good internal temperature. The area occupied by the building is about 100 square feet, and it consists of a large kitchen, and a work room, both of which form the vestibule. On the right, a large room has been set aside for the use of guides, which contains ten beds, on the same side as the director's room, with four beds. On the left, there is the registering laboratory, and an extremely well-organised room for photography and spectroscopy, lighted solely from above by means of a window of coloured glass. There is also a sleeping apartment, with four beds, and an excellent physical laboratory.

EFFINGHAM HOUSE, ARUNDEL STREET,  
July 14th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

MR. JOHN BURNET, Architect, was presented with his portrait, painted by Mr. Guthrie, as a testimonial last week.—Mr. William Gilfillan,

then narrated some interesting incidents in his professional career.

THE Building Act Committee of the London County Council has prepared an interesting report relative to the stands erected to view the Jubilee procession. In all 1226 applications for temporary stagings were received, of which 1104 were granted (but in forty-eight cases the licences were not taken up), ninety were refused, eight were withdrawn, and twenty-four were made too late to admit of their being dealt with. By far the greater number of stagings in respect of which licences were granted required amendments of a more or less important character, and in very many cases, even where the applications were made and the plans submitted by Architects or practical carpenters, it was found necessary to point out the need for the tying together by braces of the different parts of the structures. Among the stands were some of very large size, and their construction was specially supervised, not only by the Architect but in some cases by the engineer also. The Committee thinks it only due to the district surveyors concerned to state that they one and all exercised efficient and vigilant super-

purely local, experience, Mr. Josiah Thomas had long enjoyed the reputation of being a most capable judge of property, and his services to the city did not debar him from a large private practice.

LAST week the patch of the "Waste of Walworth," granted by Richard II. to Sir William Walworth, Lord Mayor of London, for his services in suppressing Wat Tyler's rebellion, was placed in the hands of contractors. It is to be converted into a recreation ground for the use of the children of the densely populated neighbourhood in which it is situated. The "patch," which is in the vicinity of East Lane, was long inhabited by gipsies, who were ultimately evicted by the sanitary authorities. Later on it became the Sunday resort of quack doctors, political agitators, cheapjacks, and Salvationists. The ground has been purchased for £6000, which sum is to be found by the London County Council and the Newington Vestry. Mr. Bailey, M.P. for Walworth, has contributed £375 for the erection of a gymnasium, and levelling operations are now being carried out.

The principal witness examined last week

A. O. COLLARD, ARCHITECT.

who presided, said that the testimonial was a token of the respect they bore towards Mr. Burnet for the high qualities he had manifested during his long career as an Architect in Glasgow. His intellectual powers had placed him in the forefront of his profession, and he had executed commissions, civic and ecclesiastical, of a magnitude that fell to the lot of few.—Mr. Thomson, on behalf of the Architects, Mr. R. Whitson, of the measurers, and Mr. John Paterson, of the contractors, offered a few words of congratulation.—Mr. John Burnet expressed his gratitude for their kindness, and his appreciation of the form which it had taken. Nothing could give him more pleasure than to receive a portrait painted by so eminent an Artist. It had always been a pleasure to him to have his designs carried out by friends present and absent. Mr. Burnet

vision over the actual construction of the stands after the plans had been approved by the Council's staff. It was found necessary to condemn 202 structures in various parts of London, consisting chiefly of temporary stands and balconies.

WE regret to announce that the long illness of Mr. Josiah Thomas, the Bristol city surveyor, has terminated fatally. Mr. Thomas had practically been in the city's service all his life, for after leaving the Bristol Grammar School he joined his uncle, the late Mr. Armstrong, C.E., who was then city surveyor, and he succeeded to that office when still a young man, holding this important appointment for more than thirty years. A man of great ability and industry, with thorough knowledge of his profession, and with altogether exceptional, if

by the Select Committee on Museums was Sir John Taylor, the chief Surveyor of the Board of Works, who said his department had control of all the public buildings in London, except those belonging to the Post Office. At South Kensington there were many old and some new temporary structures in close proximity to the galleries which were of an extremely inflammable character. Besides these, there were in the Cromwell Road front some very old and dilapidated buildings of a most combustible nature, occupied for residential and office purposes. The residences of the three chief officials had been built by the Department of Science and Art, but they had no pretensions to being fireproof. He considered that the whole of the temporary buildings should be at once removed as rapidly as possible, and re-built. The dangers of the

building had been placed before them by Mr. Street, an expert, who had been called in to report on the question. Since then very little had been done to improve the condition of things. There was no practical difficulty in renewing the roofs and making them fire-proof; the only question was one of cost. The buildings on the south side had no pretence to fire-proof construction. The floors and the roofs were both of wood. If money were provided by the Treasury, the Office of Works would at once proceed with the rebuilding. The plans were in part ready, and the only question was as to the front. The designs for the new building had been selected five years ago, and part of the working drawings had been completed, but there was no money to carry them further.

ONE of the oldest houses of Paris is to disappear in the course of a few days under the pick and crowbar of the contractor. The Hôtel des Arquebusiers, now No. 39 in the Rue de l'Arbalète, dates from Charles VI., and served as the headquarters of the crossbowmen during the fifteenth and sixteenth centuries. The vast garden, which still exists, afforded space for shooting practice and merry meetings. About 1578 the building became a school of apothecaries, whilst the grounds were converted into a physic garden. Later on the nuns of St. Agatha, vowed to perpetual silence, were the tenants, and the ladies of the Port Royal succeeded them. Then for a time less reputable occupants held the lease; but after the outbreak of the Revolution religion came back again, and the Mass was sung secretly in this retreat. An orphanage was next established by the Sisters of St. Vincent de Paul, and, finally, the Christian Brothers set up a school which, under lay direction, has existed to the present day.

THE well-known French painter, M. Dantan, who was taking a holiday at Villerville, was killed last week in a carriage accident. Joseph Edouard Dantan was born at Paris in 1848. He was the son of a sculptor, and made his début in the Paris Salon of 1869 with a picture entitled "An Episode in the Destruction of Pompeii." M. Dantan executed a large painting, "The Holy Trinity," for the Chapel of the Hospice Brézin, at Marnes. He obtained several medals, and was decorated with the Legion of Honour in 1880.

At a general meeting of the Institute of Painters in Oil Colours, Sir E. J. Poynter, P.R.A., Sir E. Burne Jones, Messrs. G. F. Watts, R.A., Frank Dicksee, R.A., and Frederick Sandys were elected honorary members; and Messrs. Wm. Llewellyn, Julius Olsson, Niels M. Lund, W. B. Wollen, R.I., Alfred Withers, and Robert Noble, A.R.S.A., were elected members.

At the International Congress of Naval Architects in the Imperial Institute, an interesting paper was read on "The Advances made in the Mathematical Theory of Naval Architecture during the Existence of the Institution," by Sir Edward J. Reed, vice-president. He said that the Institution of Naval Architects had powerfully assisted in advancing the theory of the Profession from its state in 1860 to its present condition, and had thereby taken a very important part indeed in that scientific expansion which was perhaps the greatest glory of our Sovereign's reign. The mathematical theory of naval Architecture naturally separated itself into the following divisions: (1) The science which dealt with the strains to which ships were subjected at sea, and with the provision of the strength necessary to withstand them; (2) the science which regulated dimensions, forms, and weights, so that vessels might float under all conditions with due displacement, draught of water, and stability; and (3) the science which provided for so adapting form to fluid resistances that vessels might be propelled, either by external or by internal forces, with due economy and security. A full exposition of the principles of strain would have to start with an investigation of all the strains to which ships were subjected, and to comprise a

theoretical explanation of the manner in which these were all provided for. This investigation had not yet been made, or even attempted, in any connected or exhaustive manner. It would be a great advantage, doubtless, were a theory of strain and of strength worked out in detail and with precision. But the production of such a theory, and its embodiment in appropriate formulae, was a task reserved for the future, and one not unworthy of the labour of some of our younger men.

THE Thoresby Society recently visited the Parish Churches of Thornhill and Dewsbury, with the view of inspecting the monumental and architectural relics, to which considerable interest attaches. In 1879 Thornhill Church was restored by Mr. G. E. Street. Mr. S. J. Chadwick pointed out the architectural beauties of nave and chancel, and directed attention to the fine tombs in the Savile Chapel, between which and the chancel is a monument, with canopy, to Sir George Savile and his wife. It is of the date of Edward IV. Some shafts of the fine Runic crosses were also examined, and mention made that the runes had been read and a translation published. Some ancient glass in the east window of the chancel was also described by Mr. Chadwick who, at Dewsbury, gave the history of the Church from Paulinus downwards, and directed attention to several relics of crosses and tombs dating from early Saxon times, explaining their character, and describing the peculiar ornamentation. A few of these had been discovered beneath the flooring when the Church was last restored, quite recently. Two, a supposed head of Paulinus and a portion of a cross, dating, it was believed, from the early days of Christianity in these parts, had been discovered at Pellon, near Halifax. They had been bought by an inhabitant of that town from a verger or grave-digger at Dewsbury Church, early in the present century, and taken away, and were restored by the Vicar of Pellon, to whose grounds they had been brought from Long Lover Hall, near Halifax. The clustered open columns in the south arcade of the nave of the Church, one only dating from the thirteenth century, were described, and so, too, was the ancient glass in a window of the north transept, in which are the arms of St. Martin, Earl Warren, and other notables of Feudal times. Some of the glass dates from the early part of the fourteenth century, and affords examples of good work in colour, design, and workmanship.

Two additions have lately been made to St. Olave, Hart Street. The first consists of a tablet to the memory of the late Mrs. Povah, wife of the rector. This has been placed by Dr. Povah in the north aisle, immediately under the middle of the three large windows there. The work is that known as opus sectile, and has been executed by Messrs. Powell and Sons, with the approval of Sir Arthur Blomfield. It is framed in alabaster. In the upper part of the monument, depicted on a ground of blue, are three angelic figures bearing a scroll. In panels at either side are the monograms I.H.S. and X.Pt., each on a shield, the background being floriated. Below, on gilt mosaic work, is an appropriate inscription. The whole is a very pleasing accession to a part of the Church somewhat lacking in warmth of colour. The rector has also presented to the Church a very rich altar frontal. Sir Arthur Blomfield was the designer, and Mr. A. Stalman, of Frith Street, executed the work. The colour of the cloth is red. On the super-frontal are worked in gold the Latin words of the Ter-Sanctus. The frontal itself is orphreyed, the ornaments on the latter being natural subjects, conventional foliage, roses, &c. In the centre is a vesica-shaped enrichment, on which is embroidered the sacred monogram.

At the sale of the pictures of Sir John Millais, his famous Holbein was purchased for 2000 guineas, and we learn that it has been sent to the Berlin Museum. It is a great pity that such a work should have been allowed to leave the country, and Sir Edward Poynter was most anxious to secure it for the National Gallery. Lord Ashburnham's Rembrandt

(one of the finest pictures in the world) was privately purchased a short time ago for the Berlin Museum, and Lord Darnley's splendid Titians, from Cobham Hall, has been allowed to go to the United States.

THE tomb of Tu-Duc, King of Annam, is just now the cause of a good deal of excitement in certain circles in Paris. The French Resident at Hué, in order to make a new road, has decided that the tomb of King Tu-Duc must be demolished, as it blocks the way. The Annamites, however, hold in great reverence the graves of the dead, more especially of their kings, and made vigorous protests against the demolition. As the Resident persists in his intention, a petition has been sent to Paris, the result of which the Annamites await with much anxiety.

THE well-wooded and historic country around Edge Hill afforded a very pleasant ground for the Archaeological Section of the Midland Institute last week. Arriving by train at Fenny Compton, the party drove first to the village and the interesting Church, with its short pyramidal spire, having, in common with Olney and a few other spires, a curved outline. Thence by a long ascent Burton Dassett was reached. The Church—large, solid, and handsome—has lately been repaired by Mr. Jethro A. Cossins, and presents none of that unpleasant appearance of newness so common in restored Churches. Here were noticed capitals of Early English date, sculptured with heads and animals—an unusual feature. Monuments to the Temple family, with quaint inscriptions, were also seen. At Burton Dassett, is an old stone building, for a beacon cresset, which could have conveyed an alarm from Nettlebed, near Henley-on-Thames, to the Wrekin, and from High Cross, in Leicestershire, to the Malvern Hills. A drive through Avon Dassett brought the party to the Church of Warmington, much of interest was here noted, especially, as in all these churchyards, are the old deeply-sculptured thick gravestone of Burton Dassett and Hornton Stone—along the lane by the old British Camp of Nadbury. At Hornton a large and unrestored Church was found, having features of Norman and plain thirteenth century work. A visit was then paid to Horley Church— notable for very tall arcades, and for a large fresco on the north wall representing St. Christopher. It also contains a small sweet-toned organ, which once belonged to King George III. The next Church visited was Hanwell, with the remains of Hanwell Castle, forming part of a large brick mansion, of which about a third stands, and is used as a farmhouse. The Church is of very early fourteenth century date, and shows many very elegant features. Its points of interest were explained by the rector, the Rev. V. Pearse, and are well worthy of careful study to the Architectural student. A remarkable feature is that the capitals of the nave-arcade are formed of human heads and busts. This completed the day's excursion.

WRITING to the Liverpool Mercury, Professor Herkomer says: "I have every reason to believe that a great number of Art lovers in Wales are awaiting with interest the realisation of my scheme for Art education in the Principality, and I am fully convinced that they have recognised the full-heartedness with which I took up the cause. It is, therefore, with positive pain that I have to declare that I am compelled to abandon it, on the simple but imperative ground of health. The further I got into my scheme the more I felt that every detail would have to be personally superintended for some time to come. Needless to say, this would have entailed the very strain that has been so strictly forbidden me. But much of the bitter disappointment which I feel would be dispelled if I could believe that my scheme would, at no distant period, be taken up and worked out by others, as far as practicable, and that my agitation for Art in Wales might yet bear fruit. I will, of course, adjudicate and superintend the Art section at Newport as promised. As for my scheme, I had planned Schools of Arts and Crafts, where

work should be done which was purchasable by the public. This meant Schools that were pre-eminently intended to be self-supporting when once fairly started. I should thus have opposed the present system of technical education on the most vital point. For such an original experiment Wales seemed to me admirably suited, because it afforded practically clear ground. Although my plan was to make things that belonged to daily life, I did not lose sight of the painter in my forms of tuition. But I intended to evolve him out of the craftsman. It would be futile here to give my programme of tuition in detail, but I am quite prepared to entrust the full scheme, as far as I have thought it out, to anyone nominated by Wales to carry it out."

ONE cannot but appreciate the spirit in which the Newcastle Daily Chronicle drew attention to Newcastle's indebtedness to its famous Architect, Mr. John Dobson, for many admirable works and ideas, and to a fact now forgotten by many, i.e., that among his many and various plans for the improvement of Newcastle, an aim he seemed constantly to keep before him, was a projected plan of a high-level bridge over the Tyne between Newcastle and Gateshead. At the time of the construction of the Newcastle and Darlington Railway, it was at first proposed to leave the terminus at Gateshead, and, though several plans and reports were submitted for a high-level bridge, Mr. Dobson was the first to suggest the novel and original project of a high-level bridge with a carriage and footway, and above that a double line of railway, to cross the river from Gateshead direct to the Central Station. There had been much opposition to the scheme of placing on its site in Neville Street, Newcastle, the Central Station which Mr. Dobson designed, for it had almost been decided to leave the railway at Gateshead, the passengers, at great inconvenience, to be brought to Newcastle by carriage. By bringing the railway by means of a high-level bridge from the south over the Tyne, all the local railway systems were made to converge at the Central Station. This was of undoubted benefit and advantage to Newcastle, and it was first conceived in Mr. Dobson's idea and plan. Mr. Robert Stephenson designed the high-level bridge, which was constructed from his own designs. The original idea of such a bridge was Mr. Dobson's, but the credit for the actual design and construction of the high-level bridge as we have it to-day belongs to the engineer, Mr. Stephenson. Mr. Dobson, himself anxious to do honour to his old friend, Mr. Stephenson, did coloured drawings of the latter's principal works, such as the Menai Bridge and the Viaduct at Berwick, for exhibition upon the walls of the dining-hall at the Central Station, when, in July, 1850, a banquet was given to Stephenson, attended by about 400 of the most influential of the gentlemen of the district.

ON two occasions the London County Council has endeavoured to obtain Parliamentary sanction for the construction of a tramway across Westminster Bridge and along a portion of the Embankment. Failure has attended each effort, the House of Commons throwing out the first bill, and the House of Lords rejecting the second. Having regard, however, to the recent development of the Council's tramway policy, and to the fact that by 1898 nearly the whole of the London Tramways Company's system will have become purchasable by the Council, it is considered desirable to seek powers for the construction of a line from the existing termini at Westminster Bridge Road and Albert Embankment, across the bridge, and along the entire length of the Victoria Embankment to Blackfriars Bridge. This is further than any previous scheme suggested the line should be carried, and the estimated cost is £22,000. The Tramways Committee proposes to seek the necessary Parliamentary powers next session.

WITH reference to the Burges monument in St. Paul's, Mrs. Edna Lyall writes as follows: "As a descendant of the Burges family, I

venture to ask space in your columns to protest against the conduct of the Dean and Chapter of St. Paul's. Acting in utter disregard of the express wishes of those who have a right to be consulted, they insist on removing from the place it has always occupied in the south aisle the monument erected to the memory of the late Captain Burges, R.N., who was killed at Camperdown, and intend to put it in the crypt. The monument was erected by the nation to the honour of a brave man who laid down his life for his country, and we cannot think that fair-minded Englishmen will, without a strong protest, allow the nation's tribute to an eighteenth century hero to be removed because a dean desires that the monument of a nineteenth century painter shall take its place. St. Paul's is wide, and may, surely, offer an unoccupied site for the memorial to Lord Leighton."

At a meeting of the members of the Strand Board of Works held on Wednesday, the Improvements and Parliamentary Committee reported, with reference to the proposed widening of the Strand, that the Bill of the London County Council as it now stood provided for the removal of the block of houses lying between the Churches of St. Mary-le-Strand and St. Clement Danes, bounded on the north by Holywell Street and on the south by the Strand. The effect of that would be to make the Strand at the eastern end of Holywell Street 146ft. wide, and at the western end 133ft., while the gradients would be bad, involving a drop from north to south varying from nearly 2ft. opposite Norfolk Street to upwards of 4ft. at the western end of Holywell Street. The Committee recommended that a representation be made to the London County Council that the Board considered that a much greater public improvement would be effected with little, if any, additional cost by the Council obtaining powers to purchase the whole of the block lying between the south side of Wych Street and the north side of Holywell Street, and to widen the Strand to a uniform width of 100ft. between St. Mary-le-Strand and St. Clement Danes, utilising the remaining area as a building site.—After a discussion the report was adopted.—On the motion of Mr. Beasley, seconded by Mr. Cooper, the question of making Little Newport Street an uniform width of 40ft. as a further improvement, consequent on the adoption of the scheme for the closing of Earl's Court on the Salisbury estate was remitted to the Improvements Committee for consideration and report.

AMONG the many fine stone buildings which are constantly springing up in the City, mention must be made of a recently completed block of offices in Walbrook, London, E.C. The old brick houses, Nos. 10, 11, and 12, Walbrook, which were erected shortly after the Fire of London, have been pulled down, and on the site Brook House, a fine block of offices, the elevation of which has been carried out in Portland stone, has been erected. A leading feature in the design, which was prepared by Mr. Delissa Joseph, of Basinghall Street, is a bold range of stone columns, springing from the base of the first floor, and occupying the height of two stories of the superstructure. A square stone porch at one corner of the building leads into a hall, from which a fine stone staircase gives access to the upper floors. There is also a hydraulic lift, which runs up the side of the building. The whole block contains fifty-two rooms, which are let out in suites as offices, and the rooms are one and all provided with large square windows, which afford a maximum of light. The building is of fireproof construction, and is provided with a range of lavatories on each landing. The electric light is fitted in every room. It is a noteworthy fact that every office in the block was let before the building was completed. The work has been carried out by Messrs. J. Allen and Sons, of Kilburn.

OLD pupils of Dr. Goulburn desire to place in Rugby Chapel some memorial of that kindly and witty scholar and generous head master. With the entire approval of Dr. James, it is

proposed to raise £250; to replace the west window in the south transept, placed there by Dean Goulburn himself, the colours of which, Munich work, have greatly faded; and to intrust the window to the well-known glass-stainer, C.E. Kempe, an old Rugbeian of Dr. Goulburn's time.

A CURIOSITY in the way of coffins is at present on view in an establishment in Liverpool, where it was constructed according to the design and order of, so it is said, an Admiral of the British Fleet. Instead of the ordinary landsman's oblong black cercueil, the Admiral's last mooring-place is in the form of a gaily-painted trim-built wherry. It is of strong build, and is in all respects constructed on the lines of an ordinary double-ended lifeboat, without, perhaps, quite as much shear as is usually found in such craft. This boat-coffin is carvel built and 7ft. long, and will be painted, like an old man-of-war, with black and white portholes. Life lines will be fixed round her, and when completed she will present a very tidy, seaworthy appearance. Two oars are to be supplied, and rudder and tiller will be duly fitted. The wood used is pine, West African mahogany, oak, and elm. The internal "get-up" is to be left for the undertaking furnisher, and will no doubt be of a fitting character.

At Bry-sur-Marne a monument has been unveiled to the memory of Daguerre, the inventor of the Daguerreotype, who was born at Corneilles-en-Parisis, but passed the last twelve years of his life at Bry-sur-Marne, where he died on August 10th, 1851. The monument had been erected by international subscription. It is composed of a base surmounted by an obelisk on which rests the bronze bust of Daguerre. The bust is the work of Mme. Elisa Bloch.

THE Cabot Memorial Tower, which is to be erected on Brandon Hill, Bristol, in connection with the four hundredth anniversary of the discovery of North America, will be a hundred feet in height, squarely built, and divided into two stages, each relieved by an ornamented balcony, which will afford convenient places for observation. A feature of the tower will be its emblematical panels, several of which will be contributed by an American committee, of which Mr. Bayard, the ex-Ambassador, is president. At the base of the monument a broad platform is to have projected spaces at the angles for the reception of the Russian trophy guns, which have stood on the top of Brandon Hill for many years.

"GREAT PAUL," which has been out of order for many months, is now repaired, and was rung before every service at St. Paul's Cathedral on Thanksgiving Day. It will be remembered that it sank in its socket owing to the metal bearings by which it is suspended having become affected by the summer heat of last year, so that it could not be swung. Messrs. Taylor's men, of Loughborough, have been at work upon it since the beginning of the year, and for a time at any rate the mischief has been remedied. The bell has been slightly raised, and the bearings have been strengthened with steel rivets, which it is thought will be less sensitive to climatic changes. It is now swung easily by four men, two on each side.

WHILE workmen were excavating in Northgate Street, Chester, last week, in connection with a street improvement, they unearthed a Roman relic of far greater interest and importance than any discovered by the Royal Archaeological Society. It is the bottom of a massive pillar, 3ft. in diameter, resting on a solid base 4ft. 6in. square. A huge broken pillar lies alongside. The fragment must have been part of a building of colossal proportions, and is engaging the earnest attention of Archaeologists.

THE London County Council is again considering the scheme for constructing subways under the streets to contain the wires and tubes belonging to gas, water, telephone, and other companies, the post office pneumatic tubes (now very extensively used), and tele-

graph wires, for the sanction of which a bill will by-and-by be brought before Parliament. The cost of construction will be borne jointly by the County Council and the various local bodies, while the companies using the subways will pay rent, to be fixed either by mutual agreement or by the Board of Trade. The benefit to all concerned will be immense, for as matters are at present any company which has wires or mains underneath a road may take up any part of that road just as it pleases. It is not bound to leave the road afterwards as it found it, but is merely required to make it passable, a rule which it does no more than merely literally obey. With subways, however, the roads need never come up at all, as there would be proper doors at intervals, through which access to the subterranean regions could be obtained.

SIR JOHN GORST has resigned his position as Chairman of the Committee on the Museum of the Science and Art Department, now sitting at Westminster. At the last meeting of the Committee attention was drawn to the fact that Sir John Donnelly, the head of the Department at South Kensington, had obtained from the official shorthand writer an extract relating to certain figures which had been laid before the Committee. This was objected to by certain members, who contended that it was a breach of the rules governing the appointment of Committees. Lord Balcarras proposed a resolution that the proceedings were irregular. To this an amendment was proposed by Sir M. M. Bhowaggee, who suggested that the application of the rule in the present instance would be an injustice, more particularly as the extract in question would have been issued in the ordinary way in the official minutes in less than twenty-four hours after it was obtained by Sir J. Donnelly. The matter was further gone into at the meeting on Friday, and an amendment, which, it is understood, expressed the opinion held by Sir John Gorst, being defeated, he immediately resigned.

ON Friday afternoon the Duke of Westminster presided at the annual meeting of the Royal Architectural Museum and Westminster School of Art. The number of pupils has increased, and it has been found necessary to build a separate room at a cost of £2322. A large part of this sum is still to be raised, and his Grace contributed £100 for the purpose. Mr. M. B. Adams said for the first time for twenty years they had received dividends. Out of fifty-three candidates who went up for the South Kensington examination in drawing from the antique thirty-six were successful, and of sixty-one for drawing from life only two failed.

THE Duke of Westminster presided at the third annual meeting of the National Trust for Places of Historic Interest or Natural Beauty, held at Burlington House, on Friday. There were also present the Marquis of Dufferin, the Hon. Mr. and Mrs. J. Lowther, Sir M. E. Grant Duff, the Hon. Gerald Ponsonby, Sir C. Cookson, Sir H. Howorth, M.P., and Canon Rawnsley. The annual report stated that the Society, both by word and by deed, had operated most successfully in saving from destruction or spoliation places and objects of historical interest and natural beauty, by purchase, as in the case of Barras Head, near Tintagel, by procuring the presentation to itself of a historic monument, as in the case of the Falkland memorial, and by protest, as in cases where it had succeeded in obtaining the modification or abandonment of injurious proposals. The cases in which the Council had acted by protest, or suggestion, were numerous enough, as the growth of the population was accompanied by almost daily danger to some building or place of historic interest or natural beauty. During its existence the Trust had accomplished much, and it had initiated a movement which was now found to correspond to a general need.—The Chairman moved the adoption of the report, and said they had been very successful in regard to their efforts in certain directions, but of course had met with some failures.

## IRISH CATHEDRALS.

### SLIGO.

ON July 1st the Cathedral of the Immaculate Conception, Sligo, was consecrated. The Cathedral was opened on July 28th, 1874, and was erected at a cost of £38,000, which was paid for out of the contributions of the people of the diocese alone, no outside collections having been made. The principal donor of the Cathedral is Mr. Peter O'Connor, of Sligo, whose gifts to the beautification of the edifice amounted to over £6000. The late Bishop of Elphin contributed £5000 of his own money to the enrichment of the edifice. The Cathedral, which was begun and completed during the prelate of the late Dr. Gilhooly, stands on an eminence in the centre of a spacious courtyard. This yard is inclosed by an iron railing, mounted on a limestone base, and is fitted with ornamental iron gates. The building has a place all by itself in Irish ecclesiastical Architecture. It brings us back to the style of the earliest Christian Churches. When the builders of the East made their first departure from the Classic style and established that known as the Byzantine, the Christians of the West also surrendered the strict formal style of Greek and Roman orders and established that known as the Latin style. This, subsequently modified by the Byzantine, led to the formation of the Romanesque. The Sligo Cathedral is modelled on buildings of the earliest period of this transition, in which the Byzantine and Latin are combined in the Romanesque. Its general style is simple and severe rather than soft or graceful. There is very little ornament, the leading characteristic being strength and solidity. The mouldings are of the plainest type, the cornices are without ornament, and the arcades which connect the columns are of the old Roman style. The building depends for its impressiveness upon its massive proportions rather than any elegance in its details. The external view at once shows the severe style in which the edifice is constructed. The material is limestone, in rough ashlar, with chiselled edgings, with cut limestone dressing. The quadrangular tower is surmounted by a four-sided pyramidal spire of solid masonry, which attains a height of 210ft. The tower is a three-story structure, and is lighted by narrow windows. At its basement is the grand western entrance, a doorway deeply recessed. Its semicircular arch incloses a tympanum, which is supported on a plain limestone column. The figures on the tympanum represent the Immaculate Conception of the Blessed Virgin. Over the doorway is a canopy in the Pointed style, and above that is a cornice, which runs round the entire building. Above the cornice is a niche, over which is a marble canopy, which projects considerably, and beneath which is carved a representation of the Crucifixion. The buttresses at the sides of the building rise tier above tier, like the Pointed style, and are connected by circular arches. In the recesses thus formed are the windows of the aisles—plain, circular-headed lights. The nave is lighted by ten clerestory windows, and the transepts by pairs of large round-headed windows at the ends, and circular lights above them. The portion of the ridge of the roof above the chancel is ornamented with a cheval-de-frise in metal, and at its ending over the apex of the apse, and just above the high altar, is a large figure of the Archangel Michael with a drawn sword. There is a porch entrance to each transept on its western side. The interior is in the same plain and simple style. The peculiarity of the building is at once brought home in a remarkable way on entering by one of the transept doorways. Each transept, though rising to nave height, is separated from it by an arcade of two arches supporting the gallery above the aisle. This gallery is continued over the aisles, and occupies their entire width, as in the Church of St. Germain des Prés, in Paris, and represents the gallery of the old Roman Basilicas. This cuts off the transepts from the rest of the building. The nave is separated from the aisles by seven columns on each side, supporting the six arches on which the gallery rests. These columns are circular, of cut limestone obtained

in Ballysodare, a few miles from Sligo. The bell-shaped capitals are also of limestone, and are ornamented with the egg and dart of the Roman ovolo mouldings. Two of these arches cross the transepts. The semi-circular recess which contains the chancel extends the width of the nave and aisles, and the ambulatory is separated from the chancel by a semi-circular arcade supported on six columns. The floor of the chancel is laid in mosaic. The roof is of groined vaulting. In the spandrels between the arches in the nave are large carved corbels which support long slender pilasters, from which the arched ribs of the roof spring. The roof over the body of the Church is in plain stucco. Over the chancel it is richly decorated. The flooring of the body of the Church is in timber, with tiled passages. The building is 227ft. long by 80ft. wide, across nave and aisles, and 115ft. across the transepts. Each transept is 33ft. wide and 17ft. deep. The height to ridge of roof is 100ft., the height of tower and spire 210ft. The Cathedral is rich in stained glass windows. There are fifty-eight windows, and only the ten clerestory windows are without stained glass. The large windows of the aisle and ambulatory illustrate the history of the human race from the creation of man. Each window is divided horizontally into three panels. The style is antique, in keeping with the ancient form of the Cathedral. The five stained glass windows over the high altar represent Our Blessed Lord and the Twelve Apostles. The Stations of the Cross are sculptured in relief in terra-cotta. The pulpit was designed by Goldie, and is composed of fine varieties of marble, white and coloured, and bears the coat of arms of Elphin. The high altar is of hammered brass. The altar-piece and the two panels in the reredos are alabaster. The altar table is one immense slab of Carrara marble, which is supported on onyx pillars, with brass capitals. The throne over the Tabernacle is surmounted with a canopy supported on porphyry pillars, and behind it is an immense statue in alabaster of the Immaculate Conception. The canopy or baldachino, resting on four columns of Aberdeen granite, covers the whole altar. It is of hammered brass, and is of a highly ornate design. The baldachino is the gift of Mr. Peter O'Connor, of Sligo, and was erected at a cost of £1500. In the ambulatory behind the high altar is a pieta containing a statue of Christ resting on the arm of the Virgin Mother. This is the prize statue that was shown at the great London Exhibition. The statues are in carved unpolished oak. The episcopal throne is handsomely carved in unpolished oak, picked out with gold. The Communion rail is of Caen stone, with Sicilian marble slab. The gates are of hammered brass. The other altars are in the transepts. The transepts, crossed by the gallery of the aisles, are cut off more than usual from the body of the Cathedral, and constitute separate chapels in a stricter sense than the word ordinarily suggests. The south transept at the Epistle side is the Chapel of the Sacred Heart, and the north transept is the Chapel of St. Joseph. The altars in these chapels are of Irish freestone, and are elaborately carved. The confessionals in the aisles are recessed in the wall, and they do not impede the passages. Beside the Cathedral is the sacristy, which is connected with it by a covered way. This is in keeping with the style of the Cathedral, and contains the necessary offices for the clergy, and a chapter room and large hall.

### BELFAST.

The Belfast Cathedral scheme, about which little has been said for some months, is again attracting some public attention. We regret that the committee has not received more encouragement in its efforts to erect a Cathedral worthy of one of the most important dioceses of the Church of Ireland. The main difficulty is, of course, funds. There is now little difference of opinion regarding the need for such a building. There are some who think other needs are more pressing, though they are quite in sympathy with the proposal, but the number of those who are opposed to the project on principle is comparatively small. Belfast, with more than three

hundred thousand inhabitants, ought to have a great central Church such as that contemplated in the scheme which is before the public; and without it the equipment of the Church of Ireland for its work in the city is defective. The plan prepared by Mr. Drew contemplated an expenditure of £100,000. This is doubtless a very large sum, and everyone recognises the difficulty of obtaining it; but there are many wealthy members of the Church of Ireland who have it in their power to reduce the difficulty to moderate proportions. The sum named was not extravagant; it is less than half the amount spent by Mr. Roe in restoring Christ Church Cathedral, Dublin. It was not intended to erect an edifice such as those which are among the glories of the Middle Ages, but a large and beautiful Church adapted to modern requirements. We still hope to see such a building erected, and we trust that the committee will not abandon the scheme. The sum asked for the first section of the building was £20,000, and up to the present only £8000 has been paid or promised. Canon O'Hara says: "If by January 1st, 1901, the £20,000 has not been obtained, and the building consequently not begun, subscriptions paid may be returned, and the project may be regarded as practically abandoned." Two other plans are described in the letter of the Vicar of Belfast for obtaining a large central Church at a comparatively small cost—£7000 for the first place, and £15,000 for the second, at the utmost. The second plan has found a considerable measure of support, but many members of the committee, and some of the largest subscribers, are unwilling to abandon the hope of seeing the original scheme completed. Some think that the adoption of either of the smaller schemes would postpone the larger one indefinitely, while others think it would prepare the way for it; and the vicar himself has some difficulty in deciding. Yet if the money for either of the plans described in his letter be forthcoming, he is ready to further consider the subject with a view to carrying out one of them. The need for a larger Church than any now in existence in the city is certainly urgent.

#### ARCHITECTS VISIT LOUTH.

THE members of the Architectural and Archaeological Society of the counties of Lincoln and Nottingham last week made a two days' excursion to Louth. On the outward journey Grimoldby, South Cockerington, South Somercotes, Skidbrook, and Saltfleet were visited, and the Churches of these places, with their many objects of interest, were inspected and much admired. At Saltfleet the party were particularly interested in the history of the old-time seaport town, which was partly destroyed, together with the Church, by the incursions of the sea, and which in 1359 furnished two ships of war and forty-nine men to the navy of Edward III. for the invasion of Brittany. After lunch, on the return journey, Saltfleet by St. Clement's and All Saints', Theddehorpe All Saints', Great Carlton, and Legbourne were all visited. At Legbourne, attention was drawn to the Priory of Cistercian Nuns, founded by Gilbert de Lekeburn before the reign of King John. The Church of All Saints was also inspected. It is chiefly built of chalk. The dinner at night was followed by a public meeting, at which the Mayor of Louth (Ald. H. D. Simpson) presented an address on behalf of the Corporation and burgesses. An interesting paper, entitled "A Description of the Fabric of the Louth Church, with a Glance at its History," was given by Mr. J. J. Cresswell, and Mr. R. W. Goulding gave a capital paper, entitled "The Lords of the Manor of Burwell." On the second day a visit was paid to St. James's Church (the parish Church) of Louth, the interesting features of which were pointed out and described by Mr. J. J. Cresswell, who the previous evening contributed a paper on the subject. To all intents and purposes it is a fifteenth century Church, built in the following order: The chancel, from about 1400 to 1445, the steeple from 1445 to 1500, the nave, or at any rate the westernmost part of it, at

some period between the completion of the chancel and the completion of the tower. Of the thirteenth century Church immediately preceding the present one, the north and south doorways remain, and a large quarter foil panel in the east wall of the south chancel aisle. The present arcades also belong to this earlier Church, but the pillars have been lifted some 3ft. or 4ft. and placed further apart, making the new nave 8ft. wider than its predecessor. The new Church was lengthened by the addition of a large bay and two heavy piers. The bases of the thirteenth century Church were revealed by the excavations of the late Mr. James Fowler, in 1867-8. On the back of an archstone of the thirteenth century work were remains of an earlier moulding, which brings the earliest evidence of a site back to the time immediately succeeding the Norman Conquest, and contemporaneous with Alexander, Bishop of Lincoln 1100. After a very full inspection of the Church, the party left Louth, and visited Keddington, where the Church was examined. At Alvingham the Church of St. Adelwold was examined. It is a small structure with a tower. From North Cockerington the party journeyed to Yarburgh, and spent a pleasant quarter of an hour in the inspection of the interesting Church of St. John the Baptist. This Church is an ancient structure, in the pointed style, consisting of a nave, chancel, north aisle, and a western tower containing three bells. On one side of the western tower is a representation of Adam and Eve, under the branches of a fruit tree, on the trunk of which is the dart of death. The Church of St. Clement's, at Grainthorpe, was next visited. It is chiefly noted for its fine tower with eight pinnacles. The stay at Marshchapel was prolonged in consequence of the importance of the Church of St. Mary. This Church was restored in 1864 at a cost of £5000. It consists of a nave, chancel, aisles, pinnacled tower containing three bells, and is fitted with open oak seats with carved ends. The Church also contains a magnificent chancel screen, and a beautiful monument, on which are kneeling figures of Walter Harpham and his wife and daughter. The two Churches of St. Mary and St. Bartholomew, at Covenham, were also visited. The Church of St. Bartholomew was originally an extensive cruciform structure, but it is now a small antique fabric. On their return to Louth the party inspected the small Church of St. Andrew at Utterby.

NEGOTIATIONS for the purchase of land for the new Fire Station to be erected at the corner of Strand Road and Irlam Road, Bootle, from Lord Derby, have been concluded, and the London and North-Western Railway Company is the purchaser of the site where the present station stands.

MR. JAMES WRIGHT, of St. James' Street, Derby, has taken Mr. Thomas Hides Tomlinson into partnership with him, and in future the style of the firm will be Wright and Tomlinson. We understand that Mr. Tomlinson has had upwards of twenty years' experience as a Land and Estate Agent, Architect, and Surveyor, at the Alnwick Castle Estate Offices, and in the Midland Counties.

A COMMITTEE of the West Bromwich Board of Guardians has been considering the advisability of extending the Imbecile Wards at the Workhouse. A proposal was made to spend £8000 in this direction in consequence of a report of a Local Government official that certain alterations were necessary. The scheme, however, is to be considerably modified, but even now the cost is estimated at over £6000.

A VALUABLE collection of coins and medallions has just been presented to the Queen's Park Museum, at Manchester, by Mr. Joshua Hampson. Altogether there are nearly 1400 specimens, representing the great seals of kings and queens of England, Roman emperors and senators, and Greek and Roman statesmen and philosophers, together with a quantity of casts, including one of Napoleon I. and another of the late Prince Imperial of France.

## Professional Items.

BARROW.—The new Conservative Club to be built in Abbey Road, Barrow, is from the design of Mr. J. Y. McIntosh. The main entrance of the club premises is in Abbey Road, and on the left of the vestibule is the secretary's office. From the entrance hall access is given by a broad staircase to the first floor, provided with a balcony. Committee rooms on this floor will be connected with an additional secretary's office. Corridors will lead from the hall to spacious reading-room, billiard-room, smoke-room, bar, lavatories, w.c.'s, and bicycle store. An assembly hall, capable of seating over 500 people, will be approached from Abbey Road. It can be entirely separated from the club premises. A spacious platform, with retiring room, will occupy the east end of the hall, and below the stage there will be cloak and dressing-rooms. The materials to be employed in the construction of the building are best local brick, faced with best Ruabon terra-cotta brick.

BIRMINGHAM.—In connection with the New General Hospital, Birmingham, the sanitary appliances of Messrs. Morrison, Ingram, and Co., Sanitary Engineers, Manchester, were chosen out of a selection of samples submitted by them and other leading Sanitary Engineers, and fitted throughout the institution.

CATRINE.—Mr. A. M. Browne, Gryffe Castle, Renfrewshire, a partner in the firm of Messrs. James Finlay and Co., has intimated his intention to build and equip an institute for reading in the village, and hand it over to the inhabitants.

COLWYN BAY.—The new promenade at Colwyn Bay is fast approaching completion. It will cost about £13,000, and is being constructed by Mr. Jacob Biggs, contractor, Farm Street, Birmingham. In 1895 the Colwyn Bay District Council acquired the foreshore from the Office of Woods and Forests for the sum of £1200, and they at once set to work to carry out this important improvement, which will be finished before the close of the year.

CREWE.—A provisional contract has been signed, on behalf of the Council and Colonel Meredith, for the purchase by the Corporation of forty-two acres of land, lying to the south of the Victoria Avenue, for the sum of £8700, for the extension of the sewage farm. It has been resolved to apply to the Local Government Board for sanction to borrow £7700 for the purchase and laying out of three plots of land for the purpose of children's playgrounds.

DERBY.—The extensive alterations which for some time past have been proceeding at St. Mary's Gate Baptist Church are now complete, and the building was re-opened on Sunday. The antiquated pews have vanished, giving place to others more suited to modern tastes, the rostrum and choir stalls have been entirely altered, whilst a new heating apparatus and the adoption of the electric light will do much to enhance the comfort of the worshippers. In addition to these changes a new organ has been purchased. Externally several improvements have been carried out, the most conspicuous of which are the new gates at the entrance. The total cost of the alterations is estimated at £2000.

FOLKESTONE.—The hotel which has been in course of erection at Folkestone for many months past, has just been opened by the Gordon Hotels, Limited. A dark red-brick and terra-cotta building, surmounted by a copper dome, standing on the topmost point of the Lees, it is the most prominent and by no means the least picturesque object which meets the eyes of the approaching Continental visitor by the Boulogne-Folkestone route. Internally it displays a variety of styles of Architecture and decoration, and is certainly the most luxuriantly appointed of all the Métropole Hotels. The Architect is Mr. T. W. Cutler.

**HEBDEN BRIDGE.**—The memorial-stones were laid at Birchcliffe New Baptist Chapel, Hebden Bridge, recently. The new Chapel is estimated to cost about £9000, the greater part of which has already been raised. It will be built of dressed native stone.

**KENNINGTON, S.E.**—The Prince of Wales on Friday opened the new public baths in Kennington Road. There are three swimming baths and ninety-five private baths, and it is hoped that they will provide sufficient accommodation for the 300,000 people in the parish. As Alderman Hubbard explained to the Prince and the Duke, 11,000 families live in one-roomed tenements, hence there is some necessity for public bath-rooms. The baths are to cost about £50,000. The first-class plunge is, next to the one at Islington, the largest artificial swimming pond in Europe. A quarter of a million gallons are required to fill it.

**LEAMINGTON.**—At a meeting of the Parish Church Completion Committee, a report was read from the Architect, which included estimates for the contemplated completion of the fabric. The first estimate of £3757 was for the whole extension up to the sills of the aisle windows. The second estimate, which comprised the whole extension complete, amounted to £10,768, with £486 extra for roof in oak. A further estimate for the completion of the tower amounted to £3800. It was directed that a contract for the first-mentioned scheme should be obtained from Messrs. Smith and Sons, Milverton, at a cost not exceeding £3750.

**MANCHESTER.**—The fountain which was put up in Albert Square in connection with the opening of the Thirlmere water supply on Oct. 13th, 1894, is about to be removed, and its place will be taken by a more permanent structure. The new fountain has been designed by Messrs. Thomas Worthington and Sons, Architects. Being Gothic in style, it will harmonise with the general surroundings of the square. It will be hexagonal in shape, and will consist of three basins, surmounted by a bronze dolphin, which has been modelled by Mr. John Cassidy. The lower basin will be of granite, resting on steps; the middle one will be of Bolton Wood stone, supported by small detached granite columns; whilst the upper basin will be of granite. The contract for the work has been let to Messrs. J. and H. Patteson, of Oxford Street, and is to be carried out by them under the direction of the Architects.

**MORECAMBE.**—Twelve memorial-stones have been laid in connection with a Primitive Methodist Assembly Hall, in Parliament Street, West End. The cost of the building is estimated to be £1150, and of this £320 has already been raised. The plot of land which has been purchased is also sufficient for a chapel, plans for which have been prepared by Messrs. Howdill, of Leeds.

**NEATH.**—The old tower of the Parish Church of Cadoxton-juxta-Neath, is about being restored under the superintendence of Mr. C. B. Fowler, of Cardiff. The cost is estimated at £300, and it is proposed to commemorate the Diamond Jubilee by adding three bells, making a peal of six, at an additional cost of £200. The tower is one of much interest, and is in Early Fourteenth Century style. It is proposed to "restore" only the portions which are perished and dangerous, preserving all the sound parts, and keeping the details of the lost features as near as possible to the originals.

**NEWCASTLE.**—At a meeting of the Infirmary Building Committee it was stated that thirteen Architects had intimated their acceptance of the invitation to send designs in competition for the new building. As soon as the negotiations with the Corporation for the site are completed, instructions will be issued. The premiums for the competition are as follows: First, the execution of the work at the usual commission; second, £150; third, £100, and

fourth prize, £50. It was agreed that the Architects should be allowed six months from the issuing of instructions to send in their plans. The following is the list of competitors: William Henman, Birmingham; T. Worthington, and Sons, Manchester; Simpson and Milner Allen, London; Gibson and Russell, London; Dunn, Hanson, and Fenwick, Newcastle; Oliver and Leeson, Newcastle; Armstrong and Knowles, Newcastle; Newcombe and Adams, Newcastle and London; Dyson, Newcastle; Marshall and Dick, Newcastle; Haswell, North Shields; Clark and Moscrop, Darlington; and F. Caws, Sunderland.

**NEWSOME.**—Corner-stones of a lecture room, class rooms, and other additions to Newsome Church were laid last week. Mr. Lockwood, Architect, prepared the plans which were adopted. The additions comprise a lecture room on the ground floor, which will be divided by a movable partition, so as to form two class rooms. The upper portion will consist of two class rooms or vestries. A recess will also be provided for the choir, which will allow for increased accommodation in the chapel to the extent of forty sittings. The contractors engaged on the work are: Mason, Mr. Stock, Berry Brow; joiner, Mr. J. Crowther, Wellhouse, Golcar; plasterer, Mr. N. Jessop, Berry Brow; slaters, Messrs. Jowett, Huddersfield; plumbers, Messrs. Taylor and Sons, Lockwood; and painters, Messrs. S. Kendall and Sons, Huddersfield. The probable cost is about £350.

**NORTHWICH.**—It has been found necessary to build, at a cost of £5000, a new Church at Winington, near Northwich. The building is capable of accommodating 320 persons. It is built of red pressed brick, the nave and chancel being divided by a Gothic arch of white stone. The nave is 69ft. long, and the chancel 34ft. 3in. A tower and spire have been designed for the north side, but for the present this portion of the work will not be undertaken. The structure has been built from the designs of Mr. J. L. Pearson, R.A.

**NUNEATON.**—On Thursday last the opening of a new Primitive Methodist Church and schools took place, the Architect of which was Mr. F. J. Yates, of Birmingham. The new building, which is in style a modern adaptation of the Gothic, will hold 500 worshippers, and the schools will contain 350 to 400 children. The site cost £230, and the contract was for £2250.

**PATRICROFT.**—The Barton Board of Guardians have adopted the minutes of the Workhouse Extension Committee, and recommended the following as the order of merit of the plans which had been selected for the erection of the new Union Hospital at Patricroft:—1, Sanitas; 2, Red Cross; 3, Aut Optimam aut Nihil. On the motion of Mr. Berry it was unanimously decided to open the letters accompanying the plans. It was stated that Messrs. Thomas Worthington and Sons, Lombard Chambers, 46, Brown Street, Manchester, had secured the first prize of £50 for the plans signed "Sanitas," Messrs. Booth and Chadwick, Patricroft and Manchester, take the second premium of £30 with the plans signed "Red Cross"; and the third premium of £20 was awarded to Messrs. Maxwell and Tuke, Manchester, whose plans bear the signature of "Aut Optimam aut Nihil." Mr. Berry, in reply to members, stated that after the Board had paid the premiums it was at liberty to accept what plans it chose for the erection of the new building in the grounds enclosing the new union workhouse.

**PETERHEAD.**—The formal opening of Port Royal Harbour took place last week. The area of Port Royal, as now extended and deepened, is nearly six acres, and the work has cost £32,000, including £12,000 for forming a quay wall in the South Bay. The quantity of rock excavated has been 160,000 tons, and the whole work has been carried out within a year.

**RAWTENSTALL.**—Three foundation-stones of a new fire station, which is being built in

King Street, Rawtenstall, by the Rawtenstall Corporation, were laid recently. The new building, which is estimated to cost £3000, will include engine room, recreation room, superintendent's room, and store-room on the ground floor, with dwelling-houses for the engineer and stable keeper. There will also be a square hose-drying tower, about 66ft. high at the north-east of the building, surmounted by a fire bell.

**ST. MICHAEL'S.**—A new boys' school, erected in Tyndall's Park, at the corner of Tankard's Close, was opened by the Mayoress (Mrs. Symes) last week. Last year provision for 128 girls and 147 infants was made, and in response to the demands of the Education Department no time was lost in obtaining a site whereon a building could be erected for the accommodation of 168 boys. The necessary arrangements were made, and a site was secured from the Tyndall trustees at a cost of £360. The school has been built by Mr. C. A. Hayes, from the designs by Mr. Gough; it stands on an elevated position close to the wall of the Fort.

**SEFTON PARK.**—A new Presbyterian Church has been opened at Smithdown Gate. The edifice has not yet been fully completed, the lecture hall, guild room, and other apartments being kept back, waiting further funds. The tower is approaching completion, but, in addition to this, boundary walls, pulpit, and choir stalls are still incomplete. The design of the building has been carefully adapted to the difficulties of site, owing to the nature of the foundation. The Church will accommodate about 600. The design is of the late Scotch decorated Gothic, and the interior dressings are of red brick, with plaster panels. The Architects are Messrs. Woolfall and Eccles, Castle Street, the contractors being Messrs. Morrison and Son, Wavertree.

**SHEFFIELD.**—Lady Stephenson last week laid the corner stone of St. Augustine's Church, in Brocco Bank. Mr. J. D. Webster, of St. James's Street, has prepared the plans, and his design is for a building in the Early English style of Architecture. The Church, which, apart from furnishing, will cost £7700, will seat 650 persons. The nave will be 104ft. long and 36ft. wide, and the chancel 36ft. by 28ft. There will be an organ chamber, and clergy and choir vestries. At the north-western angle of the nave there will be a tower, rising 95ft. to the top of the parapet, and the entrance porch will be at the south-west corner of the nave. The height to the square of the building will be 36ft., and to the apex of the roof 60ft. Stoke ashlar stone and chop-faced stone from Crookes are being used, and the roofs will be covered with dark Brosley tiles. The chancel floor will be laid in mosaic. Mr. James Fidler, of Eckington, is carrying out the contract. The Lord Mayor of Sheffield last week opened the recent additions to St. Joseph's Home. These consist of enlargement of the laundry, new dormitories, and ten new bath-rooms. The baths, which are in enamelled fire-clay, were supplied by Messrs. Joseph Cliff and Sons, of Leeds. The water for the baths is heated by means of the exhaust steam from the general steam boiler passing through a copper coil fixed in a large cylinder. This has been found to give an efficient supply, but should a large number of baths be required in a short time arrangements have been made to apply steam direct from the boiler. The whole of the hot water engineering and plumbing work has been carried out by Messrs. J. B. Corrie and Sons, of Sheffield. The total cost of the work amounts to £1900, and the contractors for the work are as follows: Mason and bricklayer, Messrs. D. O'Neill and Sons; carpenter and joiner, William Lynn; concrete stairs and roof layers, Messrs. Hodkin and Jones; plasterers, Messrs. Hudson and Doré; slater, Mr. W. Proctor; painters, Messrs. J. and J. Rodgers and M. A. Topham; all of Sheffield. The Architects for the work are Messrs. W. H. Lancashire and Son, Hartshill, Sheffield, under whose supervision the whole of the work has been carried out.

## SOCIETY MEETINGS.

**St. Albans Architectural and Archaeological Society.**—The members of this Society held a meeting in the Town Hall on Wednesday of last week to hear a paper by Mr. W. Page, F.S.A., dealing with the Parochial Chapel of St. Andrew, formerly attached to St. Albans Abbey. The Hon. Secretary submitted the annual balance-sheet, which was adopted. The Secretary stated that the Society was now in such a condition as to enable it to print the proceedings.—Canon Davys stated that the committee had had under consideration the next excursion of the Society. It had been suggested that the older members had already exhausted subjects of interest in the county, and it had been decided to go abroad for their next trip. Bedford was considered a most suitable place, not because the town itself was an attraction, but more on account of the interesting Church at Silsoe, a mile or two away. The date which seemed most likely to be convenient for the trip was August 18th.—Mr. Page then proceeded to read his paper commencing with a review of the early history of English Monasticism, explaining the origin of various orders. At first parishioners held certain rights in the Churches, but as time went on and the constitution of the orders, or additional rules, made the monasteries more exclusive, disputes between the monks and the laity became frequent and acute, resulting eventually (in most cases about the fourteenth century) in the matter being referred to the Bishop, and a composition being made between monks and the laymen, when these parochial Chapels were brought into existence. Turning to the case of St. Andrew's Chapel, the essayist said that it was probable that the inconveniences of the presence of the parishioners in the Abbey Church first made themselves apparent at the time when Abbot Paul de Caen, introduced the Constitutions of Lanfranc and other reforms. It was about the time of the re-building of St. Albans Abbey, commenced by Paul de Caen, that they first heard of St. Andrew's Chapel, and found it was dedicated by Herbert de Tosinga, who held the See of the Bishop of Norwich from 1094 to 1119. They could only speculate as to the size and form of this Chapel, for no remains of it had been found during recent excavations. Little more was known of the early English Church, but it probably extended westward in a line with the west front of the Abbey Church, being divided therefrom by an arcading of three bays and the tower arch at the west. How far north it extended it would be difficult to say. The Chapel was rebuilt during the second abbacy of John Wheathamstead, a reference to it being found in a will dated 1441, leaving 6s. 8d. to the fabric of the Chapel if it should happen to be built anew. There were frequent bequests from this time until 1462, and it appeared that the rebuilding commenced about 1454, and was completed in 1462, after which period the bequests were for the repair of the fabric. The origin of the decay of the Chapel was to be traced to the practice of the Abbots of St. Alban to let out or farm the wardenship, or vicarage of St. Albans, the warden making what he could by the tithes and offerings of the parishioners. So long as the abbot let out the Chapel, his tenant was always a cleric, but after the dissolution of the monasteries they found that the officers of the Court of Augmentations had let the Chapel to farm to Thomas Chadesley, who was the innkeeper of the George Inn, at the annual rent of £13 6s. 8d. Chadesley found himself unable to perform the combined duties of innkeeper and vicar, and had to procure assistance in the latter office. He found the management of the Church so much less profitable than that of the inn, that at the end of his lease he was indebted of £93 6s. 8d. arrears of rent, and was by the Court of Augmentation discharged of the said arrears. It appeared that from this period a chaplain was put in, and from 1550 to 1552 there were no profits from the Chapel, and as subsequently to the latter date all mention of St. Andrew's Chapel ceased, it might be inferred that it was pulled down before 1553. Mr. Page, by means of a

plan drawn upon a large scale, proceeded to show what was probably the style and extent of the Church.

**The Sanitary Institute.**—On Wednesday night last at the Holborn Restaurant a large number of the members and friends of the Sanitary Institute sat down to a dinner commemorative of its twenty-first anniversary. The Duke of Cambridge, president of the Institute, occupied the chair, and among others present were Lord Kelvin, Sir Douglas Galton (chairman of the Council), Sir R. Rawlinson, Dr. W. J. Collins (chairman L.C.C.), the Earl of Stamford, Sir Guyer Hunter, Sir A. R. Binnie, Colonel Jones, V.C., Dr. R. Farquharson, M.P., &c.—“The Sanitary Institute” was proposed by Sir Henry Burdett, who reviewed the important work done by the Sanitary Institute since its formation in 1876. The Institute had been placed in a sound and prosperous condition; the main objects being to secure to every man his birthright—namely, good water, good light, and good houses to live in.—Sir Douglas Dalton replied, and said the object of the Institute was to disseminate sanitary knowledge as affecting public health, to maintain a permanent museum of sanitary appliances, lectures, examinations for sanitary inspectors, &c.—Other speakers followed.

## Trade and Craft.

## HORSELESS FIRE-ENGINES.

There is now being constructed for use by the Boston Fire Department a horseless steam-engine of great size and power, having a contract capacity of 1350 gallons of water per minute, but the builders, in view of recent tests, are confident that this engine will throw 1800 gallons of water per minute. The heaviest fire-engine for horses weighs 10,000lb., its throwing capacity is 1100 gallons per minute, and at least three horses are required to draw it. The self-propeller can travel on a fair level road at a maximum rate of twelve miles an hour, and can climb any ordinary gradient—in fact, any one that a team of horses can surmount with a heavy load.

## A WONDERFUL ARCH.

A triumphal Jubilee arch of a somewhat remarkable character was put up at Widnes by the Widnes Foundry Company. The arch, which was designed by Mr. J. A. Inchboard, and which we are able to illustrate on this page, was composed of ironwork made for various contracts secured by the Company. A section for the Central London Railway

**The Institution of Mechanical Engineers.**—In 1847 the Institution of Mechanical Engineers was founded in Birmingham, which continued for many years to be its headquarters. In course of time, however, the institution moved its headquarters to London, where they still remain. Like some other professional bodies, the members of the Institute meet only at infrequent intervals, in the present instance four times a year. Three out of the four meetings are usually held in London, the summer meeting taking place in the provinces. This being the jubilee year of the institution, it has been decided that it shall revisit its old home, and this year's summer meeting will therefore be held in Birmingham. The sittings will be held in the Municipal Technical School, and will begin on Tuesday, July 27th, and on this day and on July 28th the reading and discussion of papers will take place. The afternoon will be devoted to the inspection of local works, besides which there will be alternative excursions to Wolverhampton and to Olbury or Tipton, where a number of the leading engineering and electric lighting establishments will be visited. On July 29th there will be two excursions, one to Stratford-on-Avon and the other to Walsall. The meeting will terminate on July 30th with an excursion to Coventry, where eight manufacturing establishments will be thrown open to the members for inspection, five of which are cycle works.

formed the arch itself, and columns and railings intended for the Edinburgh Waverley Station, Morecambe Pier, sundry South African works, &c., formed the supports and ornamental work. The flagstaves were an adaptation of tie-rods.

## FIRE AT A TIMBER WORKS.

A destructive fire occurred on Wednesday last at Roe's Timber Works, Derby. In a short time the greater portion of the premises were involved, and the efforts of the fire brigade, though promptly rendered, appeared to make little headway. The fire originated in the drying shed, and the rapidity with which it spread created a panic throughout the neighbourhood, the contents of 100 cottages being pitched into the streets by their terrified occupants. The actual damage done will amount to about £20,000, and is covered by insurance; but over 120 workpeople will be thrown out of employ for many months.

## INTIMIDATION AT LIVERPOOL.

In connection with the strike of plasterers now in progress in Liverpool, John Johnson, of Danube Street, Liverpool, a plasterer on strike, was charged with having intimidated a non-unionist plasterer with a view to compel him to abstain from working for Messrs. J. B. Johnson and Co., contractors, Crown Street, Liverpool, whose employ he had entered during the strike. A solicitor appearing on

behalf of the defendant admitted the offence, and expressed the willingness of his client to apologise to Messrs. Johnson and their employé and to submit to be bound over to keep the peace towards the employé. Upon the defendant stating in Court that he entirely associated himself with the apologies and assurance of abstinence from the repetition of the offence which his solicitor had proffered on his behalf, the magistrate ordered that he pay two guineas towards the prosecutor's costs, and be bound over, himself in £10, and a surety in £5, to keep the peace.

#### IPSWICH BUILDING TRADE DISPUTE.

According to the terms of the settlement, the majority of the men out on strike in the Ipswich building trade have returned to work. Several of the masters are naturally short-handed on account of so many men having left the town, but the vacancies have to some extent been filled by strangers who arrived shortly after the commencement of the strike, and the majority of whom were engaged on the understanding that they should have permanent employment.

#### MESSRS. HAYWARD'S DECORATIVE MATERIALS.

A few days since we paid a visit to the show rooms of Messrs. Hayward and Son, at 322, Regent Street, where an exhibition of mural decorative materials is now being held, and were shown some very pleasing designs and materials which should speedily find favour alike with the public and the trade. To cite only a few of the many highly artistic mural decorations to which we were introduced, we would especially draw attention to the rich hand-painted stencil design on flock by Mr. Pite, which has been denominated "Mazarine," which is admirably adapted for a dining room, and which has a very charming and totally unexpected effect when seen sideways. Another admirable design in low, soft tones, well adapted for a boudoir or morning room, is that known as "Thunberg," which is hand painted on a printed design, and is the creation of Mr. A. L. Gwatkin, the tints being blues and greens. Another good design was one in reds and yellows, by Mr. L. P. Wood, while a good staircase covering was a rich and bold design on a printed outline in rich reds. Other good effects are shown in the Fontainebleau paper by Mr. John Belcher, which is a scroll design in yellows on a grey ground; the "Chatsworth" frieze of Mr. Gwatkin, in which no fewer than seventeen stencils are employed; the "Costessy" frieze, by Mr. F. G. Rice, which is a small foliage in greens on a yellowish ground; the "Wynne" frieze, by Mr. Beresford-Pite, which is a bold design of red blossom and green foliage arranged in a scroll fashion, admirably adapted for large apartments; and the "Petunia" frieze, by Mr. L. P. Wood. Characteristics of this firm are that patrons are not confined to any set of stock patterns, but can have any colouring or design they may choose carried out, while, with one exception, their designs are confined to inanimate nature—in other words, scrolls and foliage, which are admirably exemplified in the "Furness" frieze by Mr. Pite, and the "Fig" frieze by Mr. Gwatkin, this last named being shown *in situ* in the show rooms. Another feature here worth mentioning is the "Dalmeny" frieze, which is the deepest yet made in the trade, being 48 in., which has been designed by Mr. Clements Heaton, and shows a very bold treatment. And here we would call the attention of the trade to the recently introduced jute wall coverings, in which the colours are stencilled in and chemically fixed, while a little thicker quality has a double design—one on each side—and, as this jute canvas is a cheap line, it should commend itself to those to whom economy is an object. Some which has been on the walls for six months shows no sign of deterioration in any of the tints. Messrs. Hayward will also be presently placing upon the market replicas of some of the before-mentioned designs on watered silk, the effect of which is very rich and "shimmering," on cotton velvet, on satin, and other similar materials, which will no

doubt be much in demand for high-class establishments, where good taste need not suffer for lack of means. Altogether the exhibition is rich, artistic, and interesting, and those interested in high-class decoration, whether in or out of the trade, should give Messrs. Hayward a call between now and the 17th inst.

#### MESSRS. ALDAM HEATON AND CO.'S NEW SHOW ROOMS.

Marching with the times, Messrs. Aldam Heaton and Co., the well-known Art decorators and furnishers of Bloomsbury, have opened new show rooms at 89, Mount Street, Grosvenor Square, which should certainly lead to a very considerable accession of business. In this new establishment, where two floors have been laid under requisition, the ceilings have been decorated in sections, each representing a complete ceiling design, in the various well-known stencil designs for which the firm is famous, some, of course, having filled-in figures. Beside these, there are designs for wall fillings, friezes, some of the narrow ones in low tones being very pleasing and effective, and curtains and hangings, a capital variety of schemes being shown, and all, for the most part, combinations of stencil patterns, which illustrate very effectually the enormous strides the art of stencilling, when backed up by taste and artistic knowledge, has attained to, and its great superiority over block printing where artistic results are desired. On a recent visit to the show rooms, beside the ordinary stock-in-trade of the establishment, which has been most effectively arranged, we were shown some wall papers with transparent effects, which have been put up on the staircase of a mansion near Windsor, and which should certainly win for themselves a large measure of popularity, and some designs executed in tapestry and mounted on couches and chairs. A very pleasing article of the latter description was shown as a copy from an old example, in which the curving lines of the arms and legs especially call for admiration. Other items worthy of notice are the painted pine wardrobes and dressing tables, which introduce a decidedly new and very effective style of decoration, which, we may mention, is executed by young ladies, while we were pleased to find that the firm were giving attention to gesso-duro decoration. Just now Messrs. Aldam Heaton and Co. are carrying out the decorating and furnishing of the Briton, the latest addition to the fleet of the Union line, and, from the specimens which we saw of the work in progress, passengers by that vessel will have very artistic surroundings. Among the furnishings on view were handsome bookcases, inlaid with marqueterie, as also are the writing tables; leaded lights for the dome of the smoking-room, portholes, &c., together with a solid leather wall covering, embossed and gilt, which will be put up in the first class smoking saloon; while last, but not least from the artistic point of view, was a handsomely carved frieze in pine wood. The above only constitute a few of the many pleasing objects which are to be seen during a stroll through these well-appointed show rooms, where admirers of the late Dante Gabriel Rossetti will not fail to notice his portrait of Mrs. Aldam Heaton when a young woman. Lovers of the choice and the Artistic should certainly make a point of calling at Mount Street.

A CONSIDERABLE portion of the chemical works of Messrs. Earp and Co., Runcorn, suddenly collapsed with a fearful crash last week. The building was erected six months ago for the manufacture and storage of borax. The works were in full operation when the accident occurred, and a number of workmen had narrow escapes.

AYR TOWN HALL and Burgh Court House has been burnt to the ground. The damage is estimated at £20,000. The fire was discovered in the roof, and although the municipal offices were saved, the flames attacked a range of buildings occupied by Corporation employes. The organ in the Town Hall was destroyed with the building.

## Enquiry Department.

### COACHING FOR SANITARY INSPECTORS' EXAMINATIONS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I have looked through your journal, of which I have taken since Vol I, No. 1, for the rate of Trade Advertisements, which I presume is the heading under which you would require us to advertise, but could not find it. I should be glad if you would forward me at your earliest convenience the information and, if not asking too much, the name of your correspondent "L. E." Stoke-upon-Trent, who asks for information which we shall only be too glad to supply.—Yours faithfully,

FRANK A. FURBER

We shall be pleased to send you the charges for trade announcements if you will send full address. Paragraph advertisements such as those appearing on page x. are charged at the rate of 1s. 6d. for four lines—about 32 words—and sixpence per line after. The names and addresses of correspondents are never disclosed.—ED.

MR. T. H. THOMAS has designed a new bardic crown for the Newport Eisteddfod. In the centre is a British shield-shaped space, supporting a model of the Gorsedd in burnished silver, crystals, or amber. Surrounded by engraved lettering, within the circle, is a band of archaic raised lettering, and above is the bardic sign. On either side there are Celtic ornaments, from which oak leaves and acorns taper to the ends, the tapering being broken by two studs. All the decorations are in strong relief.

THE railway bridge at Plawsworth caught fire last week, the cause probably being the falling of some hot cinders from a passing locomotive. The outbreak was confined to the wooden "decking" upon which the rails rest. Fortunately little damage was done.

ALTERATIONS, which will involve an expenditure of about £6000, have just been commenced at the Burnley Church of England Literary Institution.

## TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BATLEY.—For the erection of thirty-five houses, Whitaker and Albion-streets, for Messrs. Talbot Bros. Mr. J. H. Brearley, Architect, Hanover-street, Batley:—  
Masonry.—S. S. Baines, Batley ... £2,700  
Joinery.—Hy. Brooke, Batley ... 980  
Slating.—Geo. Fawcett, Dewsbury ... 293  
Plastering.—S. Crawshaw, Batley ... 280  
Painting.—J. Walshaw, Batley ... 140  
Painting.—W. Kershaw, Dewsbury ... 80

BATLEY.—For the erection of ten houses, Denison-street, Purlwell, for Mr. George Box. Mr. J. H. Brearley, Architect, Hanover-street, Batley:—  
Masonry.—Edward Pickles, Batley ... £900  
Joinery.—Ephraim Sykes, Batley ... 250  
Plumbing.—Thos. Elliott, Batley ... 40  
Slating.—Saml. Crawshaw, Batley ... 80  
Painting.—J. M. Thornton, Heckmondwike ... 82  
Painting ... 23

BATLEY.—For the erection of five houses, &c., Princess-street, for Mr. David Midgley. Mr. J. H. Brearley, Architect, Hanover-street, Batley:—  
Masonry.—J. Oldroyd, Batley ... £600  
Joinery.—J. Richardson and Sons, Staincliffe ... 170  
Plumbing.—J. Firth, Batley ... 41  
Slating.—S. Crawshaw, Batley ... 48  
Painting.—J. M. Thornton, Heckmondwike ... 46  
Painting ... 20

BATLEY.—For the erection of store premises, Purlwell-lane, Mount Pleasant, for the Batley Co-operative Society, Limited. Mr. J. H. Brearley, Architect, Hanover-street, Batley. Quantities by Architect:—  
Masonry.—Joseph Oldroyd, Batley ... £730  
Joinery.—Geo. Bailey, Earlsheaton ... 500  
Plumbing.—Exley Bros., Batley ... 90  
Slating.—J. M. Thornton, Heckmondwike ... 79  
Plastering.—Jas. Lockwood, Staincliffe ... 28  
Painting ... 34

BATLEY.—For erecting four houses off Dark-lane, Batley, for John Woods' trustees. Mr. John H. Brearley, Architect, Batley:—  
Masonry.—T. Oldroyd, Batley ... £370  
Joinery.—E. Sykes, Batley ... 110  
Plumbing.—H. Wood, Batley ... 22  
Slating.—Kitchingman and Baye, Batley ... 30  
Painting.—J. M. Thornton, Heckmondwike ... 35  
Painting ... 20

### BOROUGH of SUDBURY, SUFFOLK. SURVEYOR.

The Town Council of the Borough of Sudbury invites APPLICATIONS for the APPOINTMENT of a BOROUGH SURVEYOR and INSPECTOR of NUISANCES, pursuant to the provisions in that behalf of the Public Health Act, 1875, at a salary of £150 a year.

The person to be appointed is to devote the whole of his time to the service of the Corporation.

Applications, in the handwriting of the respective candidates, which are to state the ages of the applicants (not to be under 25 nor over 45 years), and their qualifications, and which are to be accompanied by copies of recent testimonials, not exceeding three in number (which will not be returned), are to be sent home at my Office, 16, Frear's-street, Sudbury, under cover, marked "Borough Surveyor," on or before TUESDAY, JULY 20th next.

The person appointed will have under his superintendence about ten miles of streets and roads.

An Office is provided for the Surveyor by the Town Council in the Town Hall.

Personal application to any member of the Council is prohibited and will render any candidate ineligible.

Dated June 23rd, 1897.

By order of the Council.

W. BAYLY RANSOM,  
Town Clerk,

## WORKHOUSE PLANNING.

(Continued from page lxxxvi.)

By GEORGE H. BIBBY, F.R.I.B.A.

### VI.—SCHOOLS—continued.

WHATEVER improvements may be made with regard to schools in connection with workhouses, it is clear that the condition

giving something less than 300 cubic feet of space to each patient. Every dormitory and ward, moreover, appears to have had a water-closet either actually within it or leading directly out of it, so it may reasonably be supposed that the atmosphere of the sleeping-rooms throughout was not of the purest. Bearing these facts in mind, it is not surprising to find that some of these same workhouses are now said to be overcrowded with only half the number of inmates in them for which they were originally constructed, and this too

requirements of each institution, care being observed that the cottages and apartments are neither too large or too small for the salaries paid to the occupants, and that the persons entrusted with the duty of teaching the children, while having every opportunity for observation, have sufficient means for obtaining retirement, quiet, and rest when released from their duties. In the following paper I propose to deal with questions relating to the sick and infirm wards of a workhouse, and to give some plans for these as illustrations.

of many such institutions at the present time is vastly better than was generally the case in former times. An authority upon the subject has written: "The children were very closely packed, two in a bed, and in the few 'sick' dormitories that were provided the patients were scarcely better off than the inmates in health, for it will be seen that a sick ward 10ft. by 16ft. 6in., and but little more than 8ft. high, was occupied by five beds, this

notwithstanding that, during perhaps the last twenty or thirty years, they have had extensive additions made to them in the shape of detached infirmaries or separate schools, and have been improved in various ways." The apartments to be provided for the use of the masters and mistresses, and the officials charged with the duty of teaching the various trades and occupations to the children, would be arranged in accordance with the special

### VII.—WARDS FOR THE SICK AND INFIRM.

THE buildings for the accommodation of the sick and infirm inmates of workhouses should be isolated, so far as practicable, from those appropriated to healthy persons: the wards for patients suffering with infectious diseases must be specially separated.

The areas and cubic spaces to be allowed

to each patient have not been very exactly defined by the Local Government Board; for instance, their instructions or suggestions show that the wards for the ordinary sick may vary from a 600 cubic feet allowance per patient to 850 cubic feet, and generally it may be admitted that the spaces to be allowed as a minimum might be considerably augmented with advantage to all concerned.

In this paper I do not propose to include the subjects of Infectious Hospitals, and Isolation Wards for fevers, &c., but shall deal with these later. The sick wards to be here mentioned are, with the exception of the Isolation Wards, all those named in clause 68 of the Local Government Memorandum in reference to the construction of workhouse buildings, and are classified as follows:—

1. Medical ordinary sick, males.
2. " " " females.
3. Surgical " " males.
4. " " " females.
5. Lying-in women.
6. Dirty and offensive cases, males.
7. " " " females.
8. Itch cases, males.
9. " " " females.
10. Venereal cases, males.
11. " " " females.
12. Children, males.
13. " " " females.

The wards for the ordinary sick of the medical and surgical classes are required to have per bed a wall space of 6ft., irrespective of that occupied by doors and fireplaces; the floor space must not be less than 60ft., and the cubic space 600ft.; these dimensions are also necessary for itch and venereal cases.

But for the patients in lying-in wards, a wall space of 8ft., a floor space of 80ft., and a cubic space of 960ft. is requisite, and these dimensions are also the minimum allowances for dirty and offensive cases.

For children's wards a wall space of either 5ft. or 6ft. is required, but in the first instance the ward must be 20ft. in width; if the wards be only 18ft. wide the wall space should be 6ft. per bed.

None of the before-mentioned figures appear to be at all liberal unless, perhaps, compared with those adopted so far back as the year 1834; the provision at that time for the sick in workhouses was limited to a few beds in one or two wards amongst the ordinary inmates (but with a little more floor area per bed); the sick and infirm appear to have been allowed a bed for each inmate and about 250 cubic feet of space, while 26ft. of floor area was given to each patient; the able-bodied slept two in a bed, with not more than 150 cubic feet of space to each person. Such provision has long since been condemned, and so far back as 1870 the Poor Law Board issued a scale for the cubic space in metropolitan poor law institutions, which required that the ordinary sick should have 850 cubic feet per inmate; lying-in women, 1200 cubic feet; offensive cases, 1200ft.; infirm, confined to one room, 700ft.; infirm, able to leave their dormitories during the day, 500ft., while healthy persons were to be provided with 300 cubic feet each, or 50ft. more than was formerly considered sufficient for the sick.

From the table before given it will be observed that there are no less than thirteen descriptions of sick persons to be provided for in a large workhouse infirmary, apart from those separated and lodged in isolation hospitals for fever, &c., and for whom distinct accommodation is necessary, that the medical officer may have proper means of classifying the patients. The requirements of country and town unions are in many respects variable, and the variations in the proportions of the different classes of sick must necessarily affect the planning of workhouse infirmaries in all localities.

A scheme recently prepared for a workhouse in the neighbourhood of Manchester provided accommodation for twelve surgical cases, forty-eight ordinary sick, eight dirty and offensive patients, twelve itch cases, twelve venereal, and a detached hospital for fever cases, these all being for male patients; the accommodation on the females' side was

similar, but in addition there was a lying-in ward for three patients, with one labour room; arrangements were made for separate wards for sick children of each sex.

In connection with this workhouse infirmary there was arranged an administration building, which contained on the ground floor apartments for a head nurse, a waiting-room with w.c., a dispensary, medical officer's room, store rooms, nurses' lavatory and w.c., kitchen, scullery, pantry and larder, serving rooms, coal store, &c., and separate staircases for male and female officials.

The first floor contained the head nurse's bedroom and dormitories, with cubicals for the assistant nurses, linen and store rooms, box room, baths and lavatories, and servants' bedrooms.

The second floor contained the bedrooms for the dispenser and other male officials.

For the fever nurses a detached cottage was provided, these officials being entirely separated from the nurses belonging to the main workhouse infirmary.

The Local Government Board state that in any case where the number of sick is sufficient to justify a special establishment, it is desirable to arrange the infirmary so as to be under separate management from that of the workhouse, and no infirmary should, as a rule, be arranged for more than from five hundred to six hundred patients; any such separate infirmary should always possess suitable apartments for a resident medical officer, also offices, surgery, and the rooms for the other necessary resident officers, such as matrons, nurses, and others, and the itch and venereal wards should be so arranged that the patients occupying them may not come into contact with each other or with the other patients. These wards, moreover, should be respectively provided with quite distinct water closet, bath, and lavatory accommodation.

In planning the wards for the dirty, offensive, and itch patients, it must be remembered that these classes often include persons brought down to a very low condition, not only by want and privations, but by the diseases from which they suffer, and the filthy conditions under which they have existed prior to their admission to the workhouse wards. It is therefore of great importance that the workhouse Architect should so contrive the wards for these classes that they should all be well isolated from ordinary surgical and medical wards. The filthy condition of some of the persons admitted to workhouses is such as to require the greatest care in their treatment, especially if also suffering from infectious diseases. These persons are, of course, not always of the uneducated classes, and it is a matter for surprise that some of these should fall, by misfortune or otherwise, into such miserable circumstances. Some thirty years since, I knew an Architect of great ability and good social position, his wife the daughter of a high ecclesiastical dignitary, himself the friend and companion of those then best known in connection with literature and Art, and the brother of a novelist of high repute; many years afterwards I learnt that he had ended his days in the apartments reserved only for those suffering from the foulest diseases in the workhouse infirmary of a great city!

Amongst the regulations of the Local Government Board the following are mentioned: Sick wards to hold one row of beds only should not be constructed, but, in the case of already existing rooms, when appropriated to the sick, they should have a width of at least 12ft., the gangway and fireplace being, if possible, on the side opposite the beds; day wards for the sick should afford accommodation at the rate of 20ft. superficial of floor space per patient for not less than one-half of those who occupy the day and night wards, but, if the sick wards are not less than 24ft. in width, the provision of separate day rooms (in the opinion of the Local Government Board) is not so necessary. As a general rule, the day wards may be on the ground floor, and should have a convenient means of access to the airing yards; but in large infirmaries some day room accommodation is usually required on the upper floors for those patients who may be so weak and infirm

as to be unable, by reason of weakness or infirmity, to use the staircases with safety.

The Local Government Board also have issued a memorandum to the effect that sick wards should be 20ft. in width if the fireplaces are at the side or in the end walls, and 24ft. in width if they are in the centre; they should be from 10ft. to 12ft. in height. In the case of small infirmaries a room or suite of rooms may be connected with a similar suite in the same line by the central part of the building, in which would be placed the apartments of the nurses and other officials; the walls of all sick wards should be plastered internally with some hard non-absorbent plaster, or should be painted to a height of 6ft. with some material which can be thoroughly washed and purified without vacating the ward; yards for the sick should be as open and cheerful as possible, but must be inclosed with such dwarf walls and palisades as are necessary for due classification, they should be furnished with seats and covered places of refuge in wet weather.

With a view of securing a cheerful appearance, the bottom of the windows should not be more than about 3ft. above the floor level, and to ensure adequate movement of air in the upper parts of the wards, it has been found advisable that the top should not be less than about 6in., at the most, from the ceiling or the wall-plate, as the case may be. The best arrangement of windows is found to be that which provides for one between every two adjacent beds, and one near to the angle of the ward beyond each end bed; movement of air and such ample light as tends to secure cleanliness is thus ensured in those parts of the wards standing most in need of such requirements.

Having regard to cheerfulness, to adequate means of lighting and ventilation, as also to the maintenance of an equable and sufficient ward temperature, it is considered, by an eminent authority, that in a well-constructed and efficiently warmed building the amount of window surface to cubic space should not vary much beyond the limits of one square foot to from 60 to 80 cubic feet, a proportion of about one square foot to every 70 cubic feet being, as a rule, the more advantageous; windows in the opposite side walls, whilst affording the principal means of ward ventilation, and constituting indeed the best means by which thoroughly, and in a short time, the entire ward air may be changed, do not suffice for this purpose. The space between the floor and the bottom of the patient's bed is found always to require special ventilation.

As a general rule, open fireplaces have under many circumstances been regarded as well adapted to ward purposes, and the additional means of ventilation they always afford may be looked upon as especially useful in the case of wards occupied by patients suffering from infectious diseases; at least one such fireplace has been found to be required for every 30ft. of ward length, and when this limit is approached those fireplaces which are provided with an air-chamber behind, by means of which warmed air from outside is passed into the ward, have been used upon account of the additional facilities they afford for maintaining a sufficient and equable temperature; where wards exceed 30ft. in length, stoves occupying a position in the central line of the ward, and having an open fireplace both in front and behind (or similarly situated closed stoves so made as to throw warmed air into the wards), have been used to maintain an equable and sufficient ward temperature.

The heights of the workhouse infirmary buildings are necessarily regulated to a considerable extent by the requirements as to cubical contents per patient, and in the arrangement of the buildings it has been found that the distance between the several pavilions, and between them and the administrative block, should, if possible, be equal to one and a half times their height, when the buildings are of equal height, and, if otherwise, at least equal to the full height of the higher of the adjacent buildings; also that the means of communication between them should be limited to a roofed passage, either entirely open at the sides or having permanent openings facing each other in the opposite

side walls; or again, to a roofed passage fitted with a central partition and being completely open on both sides of the partition, the persons using the passage walking, in windy weather, on the lee side of the partition. Such arrangements as these have been advocated by the writers of the Annual Reports of the Local Government Board and others concerned with workhouse construction and extension.

In Fig. 7 is given a recently suggested extension of the workhouse at Patricroft, near Manchester; the site left for the purpose lies between the existing workhouse buildings at A and a public footpath adjoining the railway, and is bounded on the west by a canal and on the east by a public road. The general workhouse engines and laundry are at B, the board room and offices at C (all these being existing erections), D is a proposed building for ordinary sick males, a corresponding block for females being arranged for at H, the buildings at F and J were intended for dirty cases, itch cases, and venereal cases, each being on a separate floor of a three-story building. The hospital administrative building containing the kitchens, apartments for nurses, &c., is shown at L, the blocks E and G were intended for imbeciles and imbecile sick patients, while K and M were intended for future extensions. The Isolation Hospital is shown at N, the fever laundry at P, and the fever nurses' cottage at R. Owing to the very restricted area of land, it would have been desirable that either the sick patients or the imbeciles should have been provided for in another institution, the surroundings being in various ways undesirable, and the proximity to the railway a considerable disadvantage. The Isolation Hospital at N would be at a distance of about 50ft. from the public footpath. In my next article I propose to deal with the Isolation Hospitals of Workhouses as a separate subject.

(To be continued.)

SANITATION AND WATERWORKS IN INDIA.

It is only within the last forty years that waterworks, as now understood, have been introduced into India," says the Indian and Eastern Engineer. "Of wells and tanks there have always been a large number, of all sizes and depths, but distribution by pipes was an unknown art, and clarifying or filtering was only effected by stirring up the water with the root of a rush, or by passing it through two or three large superimposed water jars containing sand, charcoal, or what not. The first work executed in India was the Vehar lake or reservoir, on the Goper river, near Bombay; this was begun in 1856, when the population was estimated at 700,000, whereas in this present year of grace it must be much nearer 900,000, or rather it was so before the outbreak of bubonic fever. The Vehar lake has a maximum depth of 84ft., covers 2.17 square miles, and is 180ft. above Bombay mean level. The impounding embankments are earth, with a central puddle trench, and are from 42ft. to 84ft. in height. The amount

of water available was estimated at 9800 million gallons, or less than four gallons per capita per diem. The 41in. main bifurcates, after passing through the dam, and the water is conveyed the fourteen miles to Bombay in two 32in. mains under a pressure of from 165 to 180 at the lower end. The works cost £650,000, and were

FIRST OPENED WITH ONE MAIN

only in March, 1860. These were supplemented by the small Tulsi reservoir in 1879, and by the enormous Tansa reservoir in 1892. This was begun in 1886. The dam is nearly two miles long, across two streams, and is of rubble masonry; the reservoir behind it covers nearly seven square miles, and has a catchment area of fifty-six square miles. The works cost £1,500,000, and the Bombay people can now have forty gallons per head per diem. The consequence of this abundance is that water is wasted to a frightful extent, and that the subsoil of the city has become sodden, and a very breeding ground for bubonic and other fevers. The only remedy for this dangerous condition of things is to connect all house drains with the main drainage, and to deliver all water, except at the public stand-pipes, by meter. At Sholapur, in the Bombay Presidency, a very efficient scheme for pumping water from an irrigation canal was opened in 1881, and cost nearly £22,000; the works at Madras and Nagpur

WERE NOT SO EFFICIENT,

but the latter has been improved, while nothing but a radical change will be of any use in the former town. At Lahore the water is pumped from a group of wells into a reservoir at the highest point in the city, and is thence distributed at a reasonable cost. The capital outlay on the works was £150,000, and they were finally completed in 1883. In 1884 the very successful waterworks at Karachi were first brought into use in their entirety. The water is got from a stream called the Malir, where it is collected in two 40ft. wells; from these it is led by a masonry conduit some eighteen miles into the reservoir, whence it is delivered by a cast-iron 24in. main at the inlet, narrowing gradually to 5in. The whole cost for supplying twenty-five gallons per diem to 100,000 persons was only £115,000, and as there is no expense whatever for pumping, it may well be considered one of the most

SUCCESSFUL INSTALLATIONS IN INDIA.

In the same year the Jahalpur works were opened. They involved the construction of a masonry dam containing over a million cubic feet of rubble masonry in superstructure and concrete founds; it is 1680ft. long, with a maximum height of 71½ft., provision having been made to raise it another 3½ft. The present capacity of the reservoir is 203,000,000 cube feet, and the work cost nearly seven lakhs of rupees. The above are all typical works, and the water from them is not filtered. In the Calcutta works, on the other hand, all the water is carefully filtered. Bangalore, Benares, Burdwan, Cawnpore, Dacca, Delhi, Hyderabad,

Jalgaon, Kirkee, Kolapur, Lucknow, Maraj, Mhow, Ootacanund, Pandapur, Poonah, Wellington, and many other smaller towns all have water supplied by works of varying importance and magnitude, and showing every variety of system. The sanitary works, according to modern idea, are of still later date. Still, at the present time there is hardly a town of any importance in which the drainage has not been taken in hand more or less successfully. But, like the many and sometimes very heavy works undertaken by municipal and other such-like bodies, no single report is issued from which the progress made in sanitation can be noted."

Surveying and Sanitary Notes.

In the Church schoolroom at Bilton, Harrogate, Mr. W. O. E. Meade-King recently held an inquiry on behalf of the Local Government Board with reference to an application by the Knaresborough Rural District Council for sanction to a loan of £3550 for sewage and sewage disposal works for the township of Bilton. Evidence in support of the application was given by Mr. James Smith, Clerk to the District Council, and the proposed scheme was detailed by Mr. D. Balfour, of Newcastle-on-Tyne.

At a meeting of the Sewerage Committee of the Aberdeen Town Council, a preliminary discussion took place on the large sewerage scheme recently drawn up by Mr. Dyack, burgh surveyor. The scheme, it will be remembered, involved a total cost of £160,000, but Mr. Dyack only pressed the adoption of a part of the scheme, involving an outlay of £75,000, with the view that the remainder of the scheme could be proceeded with at some future time. The largest item in the scheme, of which Mr. Dyack urges immediate adoption, is an outfall to the Don valley, at a cost of £33,775. This the Committee thought might well be delayed, especially as powers to proceed would have to be got from Parliament, and in this connection it was pointed out that powers would only be granted by Parliament for seven years, and that a number of years will pass before the less costly parts of the scheme are carried out. In this view it was urged that at the close of seven years the Council would again have to apply for powers in connection with the Don valley scheme, a proceeding which would be obviated if the Committee delayed the adoption of the scheme. As to the other parts of the scheme, no finding was arrived at, the members desiring to further familiarise themselves with the details of the scheme. The part of the scheme which the Committee thinks should be immediately adopted is as follows:—Low level sewer, £7670; high level sewer, from Old Ford Road to Skene Street, £9210; storm outfall at Esslemont Avenue, £130; storm water culvert, £17,080; Hutcheon Street sewer, £4180; total, £38,270.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
July 16	Coventry—Additions, Union-street Schools	School Board	G. and I. Steane, Architects, Coventry.

### Women Artists at Earl's Court.

Up to within the past few years—with one or two exceptions—there has been a unanimity of idea that women's Art work could not be considered seriously. Very naturally this created a feeling amongst women Artists that they would only be judged on their merits side by side with men; and, as a natural result, a feeling of opposition to Exhibitions of exclusively feminine interest crept in, and women who were taking up Art as the serious purpose of their lives, held aloof from any but open Exhibitions. With this sentiment still in a state of activity, although abated to some extent, the bringing together of such a collection as that which is being shown at the Victorian Exhibition must have been a matter of no small difficulty. There is all the more praise due to Miss Henrietta Rae (Mrs. Ernest Norman) for the way in which she has carried out her task. In the short and very direct preface Miss Rae ventures to submit a claim that the public have set before them "a fairly representative display" and, she continues, "we need none of us feel ashamed of the result." A walk through the galleries will be found to justify these remarks, for the collection is comprehensive and arranged with great judgment and skill. The largest number of pictures come from Miss Clara Montalba, who is always a welcomed exhibitor in any gallery in London. She, with her three sisters—Henrietta, Hilda, and Ellen—fill one room with their water-colours, oils, and sculpture. Miss Clara Montalba nearly always paints in and around Venice, finding in the ivory-toned buildings, clear sunny atmosphere and wide lagoons, with their waters reflecting the orange and yellow of the sails, her subjects. Such materials does she use in her "San Giorgio, Venice," and there is a wealth of vivid amber and gold in "The Piazzetta, Venice," a study of Architecture, a few people passing down the long street, and a fluttering mass of pigeons in the foreground. Fainter scheme of colour, greys merging into greens, as in "A Grey Day, Feltre," as delicate and subtle as a smoked pearl in its harmony. In the first gallery is a work by Mrs. Benham Hay, which is interesting. This work, "A Florentine Procession," was the only important one Mrs. Hay—whose Art career dated back to 1860—ever accomplished. Marian Collier and Alice Havers who were full of grand promise, though they neither of them lived to fulfil it, are both represented. The Newlyn Colony is strong. Mrs. Stanhope Forbes has two pastel studies—"Washing Day" and "One, Two, Three, and Away"—which are very clever and spontaneous, the latter especially, in which she has successfully overcome the difficulties of painting children as they frolic in an open field in the sunshine, the light playing all kinds of tricks on their little puckered-up faces. Mrs. Gotch is true to the traditions of the School in her large study of fisher-folk, "In the midst of Life we are in Death," which is pathetic in its realism without being sensational. Mrs. Stokes, in "The Parting," shows a somewhat unusual phase of her Art, the farewell being between a little lad and a calf, whose legs are tied ready for the market cart. Mrs. Swan, wife of the animal painter, has a pleasantly-harmonious work in "Por-

traits of Barye and Mary Swan," two youngsters garbed in blue, and hugging pet rabbits. Miss Blanche Jenkins, whose portraiture is very distinctive, has a delicate little model in "Lillies." Miss Maud Goodman ever paints little maidens with cherub faces and aureoles of golden hair, in quaint long dresses. Mrs. Swynnerton's "Cupid and Psyche" was painted some time ago, and shows none of that curiously rough technique which often tends to mar the beauty of her later work. Mrs. Alma Tadema's "The Ring" is reminiscent of much of her other work. Miss

in "Peat Marsh, Dartmoor," showing a well-composed, spacious, and luminous canvas, in which the distance and diffused light are both well rendered. Miss Wood is most successful when painting trees and marshy ground; her "Willows" has fine atmospheric qualities, the faint grey mist softening the green, and creeping in amongst the branches of the trees. The sculpture is not a particularly strong department in the women's work; but Miss M. A. Chaplin has some finely modelled dogs in "Spot," "Flora," "Basco," all favourite pets of Her Majesty.

Oriel College, Oxford. SKETCH BY J. HUTCHINGS.

Alma Tadema's Art is at its highest in two studies of clouds, "Air, air blue and white," and "The Burning Star," which show beauty of colour, close observation, and rare execution. Miss Henrietta Ray, whose work probably betrays her sex less than any of her sister artists, has several large canvases on exhibition, many of them familiar to past visitors to Burlington House. Amongst them we noted the large "Ophelia," "Daphne and Apollo," "La Cegale," "Doubts," and "Summer," the last-named painted in 1896 only, and we venture to think one of the best studies of the nude this clever Artist has produced. There are but few landscapes in the collection; the two Artists who best establish their claim for recognition are Misses Annette Elias and Stewart Wood, the former

Miss Emmeline Halse shows freedom of handling in "Studies of Babies," which are firmly moulded without being rigid.

### Egyptian Antiquities.

THE Exhibition of antiquities and papyri found during last season's work in Egypt by Professor W. M. Flinders Petrie, Mr. Bernard Grenfell, Mr. A. S. Hunt, and Mr. J. E. Quibell, is to be seen at University College. The two rooms in which the antiquities are displayed contain the results of excavations made on three distinct sites—(1) Deshashch, fifty miles south of Cairo, where Professor Petrie explored a cemetery of the fifth dynasty; (2) Behnhesa, eighty miles south of Cairo, on the edge of the western desert,

ST. JOHN'S COLLEGE, OXFORD. SKETCH BY J. HUTCHINGS.

where Messrs. Grenfell and Hunt found great stores of Roman papyri; and (3) El Kab, between Luxor and Ashwan, where Mr. Quibell made important discoveries of remains dating back to so remote a period as the fourth dynasty. Of the objects which are attractive in themselves, quite apart from their antiquarian interest, the palm must certainly be awarded to the bowls of diorite and alabaster from El Kab, which are well placed near a window so as to give full effect to the beauty of the translucent materials of which they are made. One of the diorite bowls is exquisitely delicate in hue, and when seen against the light shows the perfection of its filmy muslin-white, flecked with splashes of black. The age of the bowls is fixed, by the occurrence of the name of "the King Sneferu" on the largest, as being about B.C. 3998 to 3969. They have every appearance of having been turned on a lathe, but whether this be so or not, the skill required to hollow out a bowl from so extremely hard a material as diorite must have been considerable, and indicates an advance in the mechanical arts which it is difficult to conceive was possible so long ago as nearly 4000 years B.C. Amongst the things of a later period than the Old Kingdom found by Mr. Quibell at El Kab, perhaps the most deserving of notice are several bronze statuettes of the 26th dynasty, not buried in a tomb, but on the site of a shop where they were sold. One of the statuettes represents Nekheb, the local deity of El Kab, whose importance is magnified by making the worshippers kneeling in front of him very small in proportion. In the same room as the El Kab finds are some figures of cats carved in marble and sandstone, believed to have come from Nankratia. In the second room are the antiquities brought from Deshasheh by Professor Petrie, and the papyri from Behnesa. On the walls are hung a beautiful set of drawings, by Mr. H. Carter and Mr. Sillemof, of the sculptures which adorn the temple

of Queen Hatshepsut at Deirel Bahri; and also an instructive series of Egyptian necklaces, arranged in chronological order. Connoisseurs in coffins will find much to interest them in the specimens from Deshasheh, dated about B.C. 3500. They are rectangular boxes, and really very remarkable examples of early carpentry. The corners have mitered joints, and the boards forming the sides are secured by leather thongs—a curious instance of the survival of the primitive method of connecting the different parts of a wooden construction by tying them together. The edges of the boards are not straight but curved, the object being to economise material, which was dear, by wasting labour, which was cheap. The joints of the boards are closely fitted, and they are fixed together with dowels and pins of wood. The most curious piece of carpentry is at the top, where a small portion of the board was either decayed or wanting, and a special insertion has been cut to make up the deficiency and fitted into its place with the greatest nicety. At Deshasheh Professor Petrie found a reed mat, with a pan for offerings placed

upon it, in front of the false door of a tomb, thus affording an explanation of the origin of the hieroglyph "Hotep" (meaning an offering thence to appease, and then peace). The hieroglyph represents the reed mat and pan in a conventionalised form, not easy to recognise until the objects represented are seen. The head-rest of "the royal noblewoman, the priestess of Hathor, devoted to the great god Mera," exhibited in this room, and dated B.C. 3500, is curious as affording what is possibly the earliest example of imitating the natural texture of wood with paint, by the process known technically as "graining." Thus modern house decorators have a precedent to justify one of the most detestable practices from an artistic point of view that ever was invented. Professor Petrie considers the gem of his collection to be the three-quarter life-size statue of Neukheft Ka, the ruler of the district, found in a "Serdab," or statue-chamber, of the great tomb at Deshasheh. It is one of the finest examples of the sculptor's Art which has reached this country from Egypt.

A SUBSIDENCE, which interfered considerably with the progress of the traffic from the City to the Strand, occurred last week, and upwards of 10yds. of the tar paving in the roadway by the side of the Griffin bulged considerably. This portion of the roadway has recently been a source of trouble to the authorities, who have used their best endeavours to effect an improvement, but so far, their efforts have not been successful.

The greater part of the premises of the Working Carriage Builders' Co-operative Society on the Rue Pouchet, Paris, was last week destroyed by fire. The damage is estimated at 1,000,000 francs. About sixty autocars under construction were entirely destroyed. The fire is believed to be the work of an incendiary, the outcome, probably, of the agitation among the Paris cabmen against the adoption of the autocars. Two arrests have already been made.

## PART II.

**P**ERHAPS of all the Oxford Colleges Magdalen is the most famous to the world without; and to those within it must ever be remembered for the beauty of its chapel and its College building. Within Oxford, an artificial value, a scholastic and social value, is associated with the names of the various Colleges, and a young man, upon his going up, would for preference matriculate in Balliol or in John's; nevertheless, Magdalen Tower (and let the reader beware lest he pronounce it otherwise than "Maudlin"), standing conspicuous in its wonderful beauty upon the banks of the Cherwell just by Magdalen Bridge, is so closely associated with picturesque Oxford, and, indeed, with any reminiscence of Oxford as a place, that even to the graduates and Fellows, seeing only through the prejudiced eyes of the inner academic life, Magdalen must hold a certain sentimental significance and importance above any of the other Colleges. Nor does Magdalen rely only on its tower for this claim on the attention; the tower fulfils just such purposes as was once the primal object, and should still be the motive of all towers, namely, to commemorate, locate, and proclaim a momentous occasion, or an establishment about its base. The site of Magdalen is the most imposing and the most romantic and beautiful in all Oxford. It lies at the extremity of Christ Church Meadows, along the north bank of the Cherwell, which runs under the College walls, and which is barred to strangers by a heavy water gate. Behind the College lies a park with noble elms, where deer are kept, and beside this again, and but a stone's throw from the College, there stands what was once a mill, but which now has been rebuilt as a private house. The building partly stands over the little river, and a heavy rush of water foams through the archway into a pool below, and sends its murmur to mingle with that of the great trees about the College. This western corner of Christ Church Meadows is broken up into the hedgerows and plantations of the "Christ Church Walks," and here is the so-called "Addison Walk," where it is said that the famous poet and essayist used to wander when he was a poor unknown scholar of the University. It is a long, narrow walk, laid out in a straight line through the trees and thickets, but it does not require such suggestions as these to awaken the sentiment of the bygone

at Magdalen. Removed as it is from the near life of the town, more than is the case with the other Colleges (if, perhaps, we except Christ Church), it seems to be imbued beyond any other College with the romance and sadness which belong to them

QUEEN'S COLLEGE, OXFORD. SKETCH BY  
J. HUTCHINGS.

all. Perhaps it may be that the cloisters being inclosed within a base-wall, and the space within thus sealed as a thoroughfare, and, in a general way, to access of the members of the College, the unusual grass which grows richly there, and a few shrubs and small trees that seem rather to have been permitted to grow than to have been planted, accord with the crumbling outlines of the buildings forming the quadrangle, and remind the beholder of the association of rank growth and decayed stone work with which is associated the sentiments that hover round a ruin.

But though Magdalen shows the ill-usage of Time, as though his hand had been heavy upon her, and leads one to suppose that here next will Mr. Bodley be called to restore the walls which inspired him to his inimitable frontage on the "High," Magdalen is not one of the Colleges of early foundation. At the end of

the fourteenth century the forest and the moor still stretched away to the east gate of the city; neither were Magdalen Bridge nor the famous tower then built. Upon the site of the College there stood the old hospital of St. John. It was not till the end of the fifteenth century (about 1473) that the tower of Magdalen was built, and some hundred years after that beautiful tower at Merton, the general lines of which its own so much resemble. An interesting comparison may be made of the two towers from the perspective drawings which accompany this article. The drawings of Magdalen appeared with the previous number in last week's BUILDERS' JOURNAL, while a view of the Merton tower is published in these pages. Merton is a fine tower; it stands simply and unobtrusively among the roofs of its College, but it cannot compare with the richness and nobility of that of Magdalen. The latter must stand remarkable in many ways, and, in a matter of detail, not the least so for its octagonal angle turrets, in place of the buttresses we expect to see in a Perpendicular tower. This tower is remarkable also in that a design so restrained and simple, and so free from effort or obtrusiveness, should have been raised in a period of Gothic Art which is characterised by precisely contradictory attributes. Many will remember a certain notorious passage in the "Stones of Venice" in which Mr. Ruskin has elaborated the qualities that go to the fashioning of a noble tower. With characteristic, and therefore quite unconscious, unfairness he has typified an English Perpendicular tower as being all that is false and bad, and has placed it in literary and pictorial comparison with the famous tower of Venice, and yet, if we apply his eulogistic description of the latter, we shall find he is describing the beauties of Magdalen; and, if we regard the motives of Design which he formulates from the Italian building, we find it is an appreciation of those qualities which are most admirable in Magdalen. The tower of Magdalen is one of the few perfect and complete things in Architecture. Like the tower and spire of Salisbury, it stands through the centuries to

BALLIOL COLLEGE, OXFORD. SKETCH BY J. HUTCHINGS.

beautify the lives of successive generations, whether it is the analytical temperament of the Artist or the technical intelligences of the Architect that it inspires and strengthens in lofty ideal, or whether it is subtly telling its great unfathomable secret no less impressively to the mind untutored in the principles of architectural design. A modern writer has avowed his conviction that the great truths of the future will come to us conveyed from their creator in musical composition. We may say already that by the sister Art of Architecture there are a few great abstract lessons, not well to be formulated in the concrete terms of language, which now stand to be read by all who will.

But the charms of Magdalen are holding us too long in proportion to the many other Colleges of which mention should be made, and which will be found illustrated in these pages. It is interesting, however, to notice the well-known, oft-sketched open-air pulpit in the first quadrangle, and the unique feature in the gateway of the Founder's Tower of a flying arch which springs out from among the jamb-molds, and joins them again in the centre of the lintel, drawings of both of which were published with Part I. of this article. In the doorway to the Chapel the beautiful lily ornament in the cavity of the label mold should be noticed, and particularly the bosses of this label, sculptured in the form of angels, with their wings enfolding the molding above. The angel on the right hand of this doorway is an example of Gothic sculpture which for delicacy of finish is very rarely met with. Nor should the briefest visit to the College call

for disregard of Mr. Bodley's masterly designs. He has manipulated these Mediæval forms with a precision and an identity of impulse that alone, were he known for no other work, would establish him as one of the greatest of living Artists.

And, after Magdalen, "Christ Church" is the name that most readily rises to the memory, for here is not only the great College of memorable foundation, but the old Norman Cathedral, which is a perfect storehouse of treasures—old stalls, brasses, glass, monuments, not to forget the fine organ case of a later date, designed by Wren. There is also to be seen much good modern glass by Sir E. Burne-Jones, and there is a very curious old "watching loft" in the north choir aisle, constructed of oak upon a stone basework. Of the great quadrangle it must ever be regretted that it was not finished. The colonnade of the cloisters would have completed a magnificence which now is only hinted at. All proposals to add the intended cloister are, however, thwarted by the consequent darkening of the ground floor front sets, which are at present none too well lighted.

The famous vaulted staircase was only completed in 1640, taking the place of a former structure. It must stand as one of the finest examples of Perpendicular vaulting and fan tracery in existence. The actual staircase and the lamps seem, according to Eastlake, to be due to Wyate, and more latterly the tower above has been restored by Mr. G. F. Bodley.

All Souls' College, dating from 1437, is a most interesting College. It fronts on to the "High" and the beautiful gate tower, which may

be quoted as an example *par excellence* of the typical Oxford gate tower, is of a beautiful and perfect simplicity. All Souls, it may be noticed, is a Fellows' college. In the Chapel there is some good glass, and there is also a fine Elizabethan lecture-room on the east of the quadrangle. The windows are lead-glazed, the wall high panelled, and the plaster ceiling is arched, with a design patterned in ribs and touched here and there in the ornamental parts with colour. This room was once the library. New College has fine buildings, and gains from its picturesque and romantic situation upon an angle of the old city walls. These old walls with semi-circular bastions form two sides of the small secluded grounds beyond the quadrangles. The first quadrangle is of noble proportions, and over the whole mass of the grey College buildings there hangs a sombre, dim religious light. The picturesque covered bridge sketched in these pages leads from the College buildings to the old brew-house. "New" is famous still for its brew. The chapel is famous for some very bad glass, and for some that is as good as any in England. The bad glass is comprised in the chapel proper, where it is to be seen designs by French pupils of Reubens upon the south, and of the English on the north. The second have shown the inferior of some very poor designs. In the ante-chapel, however, is such glass, as has been said, which is hardly to be seen out of England. We do not refer to the Reynolds window at the west end, though this, through misconceptions which have now been completely exploded, is still admired by some people whose likes and dislikes are not regulated by knowledge or by their intellects. The Reynolds window may be a fine painting—it certainly shows fine drawing; but pictorial painting on glass is not decorative design in coloured glass. Anyone who will compare the silvery lights and the transparency and the brilliancy and subtle contrasts of the colours in the windows upon the north and south of the ante-chapel with the dull amber and sienna and the voluptuous outlines of the Reynolds window, while holding in mind the place and the purpose of these works of Art, can have no doubts as to the rightness of the former and the wrongness of the latter, unless he be completely untouched and unimpressed by the sentiments and the motives of Mediæval Art.

The largest bell in France has been hung in the belfry of the Church of the Sacred Heart in Paris. It weighs 28 tons, and can be heard at a distance of twenty-five miles.

At Birmingham, the new General Hospital was opened by Princess Christian, as the representative of the Queen, on the 7th inst. It was announced that the building, which has cost £210,000, was opened free from debt.

The Links and Parks Committee of the Town Council of Aberdeen has resolved to erect in Duthie Park a granite statue of Hygeia, the Goddess of Health, in commemoration of the late Miss Duthie's gift of the park to the city. The cost of the statue, with pedestal, is estimated at £400.

LORD ROSEBURY'S new house in Edinburgh makes fair progress. It has turrets of the old Scotch baronial style, and is decorated with an earl's coronet and the letter R carved in stone. The new mansion is being reared in the midst of a thickly-populated district, but it will have a splendid view of the Firth of Forth.

THE new brickworks (the Non-Porous Brick and Tile Company), at High Carr, Chesterton, were opened last week. The buildings, fitted throughout with the most modern machinery by Messrs. Fawcett and Co., Leeds, are capable of turning out 30,000 bricks per day, and the clay is certified by experts to be unequalled.

THE Bishop of Salford has opened the newly erected Roman Catholic Church in M'Leod Street, Nelson. The edifice is called St. Joseph's, and has been erected at a cost of about £4000. The ground floor is made for the purposes of a Voluntary day school, and provides accommodation for about 600 mixed scholars. The chapel is above the day school, and will accommodate nearly a thousand persons.

## MOSAIC.

By HARRY THOMSON.

BY mosaic, in the usual acceptation of the term, is to be understood the Art of producing a Design or painting by the joining together of small pieces or tesserae of hard substances either naturally or artificially coloured. Thus stone or marble chips put together will form a natural mosaic, having its colouring and veining preserved throughout its texture; and again, glass and clay, artificially coloured, present a mosaic from the fact of the colouring matter being burnt through and through the material. Supposing, however, the stone or marble mosaic were painted, or that the glass or clay had on the surface a coat of vitrified paint, the result would no longer be mosaic, but rather a surface painting penetrating no deeper than the surface. It is as well to keep this distinction in mind, especially in an age when the artificial shoulders its way side by side with the real. Before glancing at the history of mosaic as an Art, it may be advisable that we should understand its practice—a practice which, though simple in theory, is beset with difficulties in its general application.

## STONE AND MARBLE

are frequently found in pavements, and from the enduring qualities of the material employed, seem best suited for use in such a situation. The expense, however, of cutting and shaping stone and marble deters us from employing these materials to any but the most limited extent. I may mention, however, an ingenious use to which marble chips are put to suit the demand of certain modern requirements. Marble chips are thrown on a bed of cement, and, during the process of setting, are ground flat with something like a garden roller, and finally the whole surface is ground and polished till it presents the appearance and sheen of solid marble. Italian labour, for reasons which will be understood, enjoys a monopoly of this form of Art. Glass artificially coloured (that is to say, having the colour distributed throughout its texture by being melted in the furnace) has been, and still is largely used, its use, however, being confined to walls or wall pictures, although instances are not uncommon where this material has been used for covering pavements or floors—notably in some recently excavated houses in Pompeii, where the tesserae or pieces of glass are extremely minute in size. This description of work is called Glass Mosaic, and may be used alone or in conjunction with stone, marble, or clay. Baked clay, or clay having colouring matter added to the material previous to its pressure in moulds, for the production of small cubes, and submitted to the action of heat in the furnace, is known by the name of

## KERAMIC MOSAIC.

Its use has been very general of late, but in surface effect is very inferior to the lustrous quality of glass, and the strong though low toned quality of marble and stone. Add to this its liability to blacken in a smoky atmosphere, and a serious objection will be urged against its application to outdoor decoration in towns. Stone, marble, glass, and clay, therefore, are the materials usually employed in the practice of mosaic, and I might even add shells, pearls, and gems, or shining bits of metal, having the colour throughout, from the surface to the back. The tesserae, or chips of these materials, are arranged together to form a design or picture, the whole being held together by cement, and becoming, when set or hard, one solid mass. The cement commonly used by the ancients consisted of slaked lime and powdered marble, mixed with water and white of egg. This dried or "set" almost immediately, and so intensely hard that the Artist found it an impossibility to make alterations without destroying great portions of his work. To compose the bed a layer of stones and flints, with cement, was placed on the wall. Upon this was spread a coarse concrete of smaller stones and lime, which was well beaten and pressed down. The third layer was composed of lime and particles of broken bricks worked to a flat surface, and on

X X

CHRIST CHURCH, OXFORD. SKETCH BY J. HUTCHINGS.

this last layer was traced the outline of the Design. Having at hand small pieces of stone, marble, or glass, previously broken to the required size by means of a pointed hammer or chisel, the Artist arranged these tesserae on the wall one by one, filling the spaces between with liquid cement. Afterwards, when completed, all the inequalities were reduced by friction, and the whole surface brought to one uniform level. As you will see, working in this way, the

## DIFFICULTIES WERE VERY GREAT,

and the progress necessarily very slow—so slow, in fact, that a comparatively small work would take the Artist years to produce—a very fine calling for a man wishing to correct in himself the defect of impatience. The modern method of working practised chiefly in Italy is this: A plate of metal usually of zinc, having a margin rising about  $\frac{3}{4}$  in. from the under portion of the plate, is placed on a level table and a mastic cement composed of powdered stone, lime, and linseed oil spread over the bottom of the tray to the depth of about  $\frac{1}{4}$  in. When set this is covered with plaster of Paris to the level of the margin. On this is traced the outline of the picture to be made. The Artist then selects a portion and removes with a chisel just so much of the plaster of Paris as will admit of the insertion of the small pieces of glass, selecting his colour from trays, in which are kept thousands of varieties of colour. The pieces of mosaic are moistened with a little cement, and are bedded in their proper situation. A still more modern method will be described further on when I come to speak of Salviati and his

work. Our description of mosaic will be incomplete without some reference to window glass treated in mosaic fashion, that is to say, composed of small pieces of self-coloured glass held together by binding strips of metal, the design being conveyed by form and colour without any surface assistance from paint or enamel. For want of a better name this class of work is known by the term

## "MOSAIC GLASS,"

in contradistinction to the term of "stained glass," which usually refers to glass in which the design is eked out with a surface painting of enamel. Something more will be said of this modern Art when I come to speak of the work of John La Farge and the American school of mosaic glass workers. Enough has been said to give you a fairly good idea of the practical working of mosaic, and, having thus far had a previous understanding of our subject, we may now proceed to examine slightly its history as an Art. As the history of the manufacture of glass is practically the history of mosaic, for the reason that glass mosaic gives to the picture such translucency and range and depth of colour, and the fact that glass mosaic was introduced at a comparatively early date in the history of the Art, it will suffice for our purpose if we take for our starting point the manufacture of glass chiefly in its application to the Art of mosaic, premising that it is already understood that by mosaic is meant a material which is coloured throughout its texture. From the earliest times it must have been an instinct with man to lay together parti-coloured pebbles in patterns, and as natural to him as tracing figures

NEW COLLEGE, OXFORD. SKETCH BY J. HUTCHINGS.

and symbols with a stick in the sand, or carving in wood or stone. It would be idle, however, and uninteresting to attempt to trace the growth of such an Art, though there can be little doubt that its practice, in a more or less crude form, dated from very remote times. The instinct displayed in the laying together of pebbles would seem a very natural one, and, as an illustration of this theory let me refer you to the labours of our railway officials, who, emulating the suppositious example of our forefathers, still continue to indulge a natural craving for Art expression, by the embellishing of railway stations in the putting together of differently coloured stones to form the name of the place, thus satisfying at once a love for the useful, and a desire for the artistic arrangement of pleasantly contrasting surfaces. Taking leave of theories, fanciful and otherwise, let us see what history has to tell us. Some have said, and perhaps with truth, that the Arts and Sciences may have been cultivated by older races than the Egyptians, but few monuments of the Art of these nations have been left for us to study, and whatever exists gives no proof of the cultivation we see expressed in

#### MONUMENTS OF EGYPTIAN ART.

It is reasonable to suppose that the knowledge of the Art of glass-making, if not actually discovered in Egypt, was at least fostered there with other refined Arts. A story illustrating the origin of glass-making, and which, I dare say, most of us have read in our school books, is somewhat to this effect:—"Some

storm-driven Phœnician mariners, while boiling their food on the sands at the mouth of the River Belus, a small stream running from the foot of Mount Carmel, in Galilee, where the herb Kali was growing abundantly, suddenly perceived that the sand, when incorporated with the ashes of the plant, melted and ran into a vitreous substance." A fable most likely, but pleasantly illustrates the ease with which glass can be made, though the fact that glass melts at a fierce heat in a closed furnace militates somewhat against its truth as a story. It is certain that the sand about this spot was well adapted to the manufacture of glass, and, probably the glass houses of Tyre and Sidon were supplied from this locality, which fact may have given rise to the tradition. The Egyptians were certainly well acquainted with the Art of making glass and the practice of mosaic as a sister Art. Among the ruins of Memphis we find the earliest traces of glass. Of these have been found pieces of turquoise blue, probably used for the glazing of pottery vases or figures. Mummies are found which have necklaces composed of beads of glass. Tombs have been unsealed in which were discovered crowns, armlets, and jewellery of a most delicate description. Many of these relics are mosaic in character, the better class showing fanciful arrangements of valuable diamonds and precious stones set in filaments of gold, the beauty of the workmanship, and its refinement being such as to make a modern artificer feel abject despair from a conscious inability to compete with such rare excellence. Mummy cases composed of burnt

earthenware have a covering of glaze which is a true glass, and some, probably inferior mummy cases, have a coating of cement with patterns traced in lines and here and there filled in with pieces of coloured glass sunk in the cement in mosaic fashion. Mosaic in the form of glass was also used in conjunction with tiles and bricks in the decoration of walls, and in the cornices and capitals of columns. In some monumental sculptures the figures are in relief, portions of the garments and backgrounds are incised and inlaid with coloured glass mosaic fitted into the incised portions; the features and flesh in glazed ware appropriately coloured, the hair and head-dress being in mosaic, embroideries on draperies too are shown by inlaid glass patterns. Glass was used universally in Egypt in every conceivable fashion, to form hieroglyphics for the inlaying of stone, wood, or metal. Stone figures are found which are covered with glass inlay in natural tints, and so far had the Egyptians carried their love for this form of decoration as to even ornament crocodiles and domestic animals with earrings and other devices in glass. From all this we may gather that mosaic work, in a more or less modified form, was in very general request and practice throughout Egypt, and that to the Egyptians belong the merit of having invented these processes of working, a merit which the Greeks acknowledged in becoming their pupils and imitators. The Art of mosaic

#### ATTAINED GREAT PERFECTION

under the cultured direction of the Greeks, who, however, gave their preference to clay rather than glass for the reason probably that a purity of form could be much more easily obtained in clay than glass, appealing more strongly to a Greek sense of beauty. The Greeks were form worshippers rather than colourists. Nevertheless, it would seem that from an early date walls and pavements were ornamented with glass in preference to stone and marble, because by its use tones and shades could be obtained which it would be impossible to get in other materials. The use of mosaic in panels in walls probably originated in Greece, and the subject, whether on walls or pavement, was generally extremely simple in Design and orderly in the arrangement of its parts, the motive usually mythological or theatrical, and the heads, figure or animal subjects, in most cases, surrounded by arabesques of beautiful Design. About this period we trace the introduction of gold grounds applied afterwards so extensively to mosaic work. In the Temple of Diana, at Ephesus, have been found gilt discs which were covered with a thin layer of glass to preserve the gilding, possibly the germ of what we call the Early Christian Mosaic Art. Greek mosaic is, as may be supposed, severe in treatment, and the figure subjects, animals and what not, very sparingly introduced, the cutting and grinding of the mosaic being very perfect as a rule, and symmetrically disposed, costing an almost incredible amount of labour which was, fortunately for the Artists concerned, a matter of very little moment in an age when mechanical slave-labour was rewarded mainly by kicks and blows. The characteristics of Grecian Mosaic Art are then mainly these: simplicity of design, a reticence in colour, amounting almost to a negation of colour, and a general perfection of execution. The Romans, in their turn, easily assimilated the Art of the Greeks, employing Artists of that nation as their tutors, and in the demand for Art production the Art of working in mosaic received more perhaps than a due share of recognition. So great indeed seems the hold of that almost passion which the Romans entertained for the splendour of mosaic, that as an impress of the vitality of that feeling, the practice of the Art remains till to-day an industry peculiar to Italy. As with the Greeks, so with the Romans; at first glass was used only for the brighter colours which could not be obtained in marble or clay, but as the desire for magnificence increased, and the practice of the Art attained greater perfection, glass took the largest place in decoration. Thinner bits of glass in imitation of porphyry and marble were backed with stone to give the material

strength. In some instances white enamel was vitrified behind the glass in order to

#### THROW UP THE COLOUR.

Roman habitations were full of works in mosaic glass. It seems, however, when pictures were spoken of it was long thought mosaic alone was meant, but it is now proved that enamelled pictures, that is to say, glass painted with fusible glass enamel and vitrified or burned in, were sometimes used and inserted in the wall in common with mosaic pictures framed usually in marble. The wonderfully minute mosaics frequently found in beads and amulets, and sometimes in pavements and walls, have excited much conjecture as to their production, but like many other marvels, the method when discovered seemed very simple. In Pompeii and Herculaneum slabs for pavements and wall decoration were dug up in which were found pieces shaped like the petals of flowers, stars, and rosettes placed in the middle of a piece of lavender opaque glass. Specimens extremely minute in character have been discovered. One, a bust in the Slade collection, has on the forehead a lock of hair which seems no thicker than a silken thread, yet on examination under the microscope is found to consist of nine threads of opaque and transparent glass. This glass is of the kind called "mille-fiori," and was used in the ornamentation of drinking vessels, vases, and in mosaic work. The mode of production was by arranging long slender glass rods of various colours together so as to form a pattern, a flower, a picture, or the letters of a name, and then fusing these rods together in the furnace. While still hot the rod or cane thus formed was pulled or stretched till the pattern became microscopically small, always, however, owing to the ductility of glass, retaining its form and distinctness. Anyone may make this experiment for himself by holding a tube of glass above a flame, and stretching the glass, when it will be seen that the hole in the middle is never lost. Ancient writers on Roman mosaic divide its practice into four classes. (1st) Tessellated, consisting of small pieces of marble composed of pieces about  $\frac{1}{2}$  in. square. (2nd) Sectile or sliced work, made up of different slices of marble placed together. (3rd) Pictile mosaic, composed of small pieces of mixed flint and burnt clay. (4th) The opus vermiculatum, which was applied to the decoration of figures, ornaments, and pictures, all portrayed in their true shades and colours by a judicious arrangement of small cubes of coloured marbles, glass, and brilliant gems. The manufacture and working in mosaic continued in Rome till about the ninth century when the work seems to have been discontinued.

(To be continued.)

We understand that the N.A.P. Window Company's casements are being used in the Liverpool School Board offices.

IN our last issue we gave an account of Brook House, Walbrook, recently erected from the designs of Mr Delissa Joseph. We learn that the whole of the elevation above the 1st cornice is in Corsham Down stone supplied by the Bath Stone Firms Ltd.

THE fine old Church at Rothley has just received an addition to its beauties in the shape of a very costly stained glass window, the gift of a native of the parish. The colouring of the window is exceptionally beautiful, and the work has been very effectively carried out by Messrs. Heaton, Butler, and Bayne.

A LEADEN bulla of Boniface IX., who was Pope from 1389 to 1394, was recently dug up when a grave was being made in the churchyard at Trusthorpe, on the Lincolnshire coast. A similar bulla of the same Pope was found in Louth Church about twenty-eight years ago, when internal alterations were being made.

At a recent meeting of the Mablethorpe Urban District Council, it was decided to spend the sum of £1000 in making a new promenade, and in carrying out other improvements on the sandhills facing the sea at Mablethorpe. The erection of a sea-wall is also contemplated, as well as the provision of suitable accommodation for visitors.

### PROFESSOR MAX NORDAU ON THE SOCIAL FUNCTION OF ART.

TRANSLATED BY H. WILSON.

THE following most interesting lecture on an aspect of Art hitherto but little studied was delivered recently at Turin by Professor Nordau. Without ourselves adopting the point of view, there is much to stimulate thought and kindle a new interest in Art, even for those who live by and hope to live through it. Professor Nordau's conception of Art is, we think, a little coloured

patible with any pitiful preoccupation as to the likes and dislikes of the public. The fancies of the hour are but ripples on the surface of the collective thought of humanity; the real currents, the true springs of emotion lie deep. It is in seeking for these and reaching down to them that the Artist learns to succeed; not by attention to conflicting, bewildering, misleading, surface changes. Again, Professor Nordau lays stress on what he calls the democratic side of Art. Surely there is some misconception here. Art springs from the people as flowers from the soil, and as the latter are only the embroidered fringe

by the common delusion that the Artist lives only to please the public at large. It is true that the Artist hopes to please in order that he may gain greater opportunities for the exercise of his faculties, but his first aim, his prime preoccupation, is the expression of himself. The more truly he can do this—the more nearly he gets down to the unconscious sources of passion, emotion, sympathy—the more completely he can symbolise and realise his own humanity, with all its aspirations and sufferings, the wider will be the circle affected by his Art, the more universal its appeal. But such an aim demands unremitting activity; single-hearted devotion to the means of its attainment. It is utterly incom-

on the earth's garment, the visible expression of higher activities, so the Artist, in his turn, is, so to speak, a sport, the expression of the higher activities of the social organism; a more or less accidental product of the environment in which he is found; the sum of a number of unknown forces collocated and co-ordinated in one individual life. Art is kingship in Craft, not eminence in dexterity. It is lordship in sympathy, not the dominion of the unknowing. Again, it is impossible to follow the Professor when he makes of Art a kind of subtle sycophancy, a dainty flattery, a saying of smooth things. Still less can we assent to the doctrine that Art is easy of attainment. Senses, a human heart, and

familiarity with masterpieces will not alone make a critic. Familiarity too often breeds ignorance, and it is only through the patient study and sympathetic analysis of the beauty of Art, through continual effort to escape the bondage of conventional feelings face to face with masterpieces, that we can attain to any real appreciation of them or of the power that produced them. This is necessarily impossible for the majority of men. These and a few other objections apart, which each reader will readily discover for himself, the lecture is one of the most thoughtful and stimulating which have recently appeared.—The partisans of "Art for Art" will smile at the title "The Social Function of Art." Can Art, they will say, have another mission besides that of pleasure through beauty? Surely a work of Art is an end in itself. No other end can it know. Now the history of civilisation, Art, and psychology proves that such a theory is false and presumptuous. Only in the early ages of human history is Art the purely subjective manifestation of a being endowed with a special sensibility and emotivity which leads him to create a work of Art in order to escape from an emotion become so deep and enduring as to amount to an obsession. The primitive men who covered the rocks of the caverns of Mouthe with drawings of animal, who engraved the image of the mammoth on the well-known ivory tablets of Magdalen in the Dordogne, who created the sculptures and the drawings of Bruniquel in France, of Schaffhausen in Switzerland, &c., only drew, engraved, and carved for their own satisfaction. They considered none but themselves. These were the first, but also the last, purely subjective Artists, the only ones who gave themselves up to Art for Art. To find an example of this in our own day we must look in the nursery, in the classrooms of elementary schools—in the child through atavism the primitive Artist lives again. His drawings, if they are not perfect, are always depressive. The child marks down the distinctive features of phenomena, those which make the greatest impression on him. He obeys authentic impulses, and his artistic creations gush out in truth from the secret fount of his emotions. But with civilisation the manners and the methods of the Artist change. What was once inspiration becomes profession. The Artist, while still ever seeking to alleviate the nervous tension which oppresses him, becomes ambitious; and the preoccupation of success takes the place of the necessity of escaping the internal obsession. So that at the very moment in which a work of Art is conceived, we find the Artist face to face with a new element, the consideration of the known or supposed tastes of the society whose approbation he desires. Society, which thus acquires a place in the spirit of the Artist and in his creations, demands then that the Artist shall labour for it and no longer for himself. His specific activity must adapt itself to the general plane of the social organism of which he forms a part. And a manifestation which was once a purely subjective function acquires a social character. It is obvious, further, that other instincts, tendencies, and primitive appetites share with Art the latter destiny of being transformed into social forces. Civilisation has exactly this character, that it takes the emotions of man and uses them as motive forces to produce results which are not always within the scope of such emotions. Thus, the sentiment of love serves as a basis for marriage, and gives a guarantee of juridical and economic stability to the position of the wife and children: so also the common sympathy of mankind is developed into the instinct of association, and conduces to the growth of collectivity of divers kinds. Side by side with other forces even the special faculties have been made to serve social

interests. The history of Art proves this. All known works serve a social end. They glorify God, the king, the city. They raise the prestige of religion, the government, the fatherland. The Artist labours simply and solely for the Church and for the palace. He is required to ornament the Church and the cloister, to re-invigorate the faith of peoples, to strengthen the power of the citadel, to glorify the monarch or his ancestors. We must go to the Renaissance to find at the side of religious dynastic and aristocratic Art, the beginnings of an Art that was purely aesthetic. When Mantegna painted the Muses on Mount Olympus, or Lionardo, Monna Lisa, they no longer desired to excite the faith or confirm the fidelity of subjects, they desired to enrich and rejoice one sole life, that of a moneyed and noble mæcenas from whom they had received the commission. Spurred on by a primordial necessity, that of his own maintenance, the Artist had until now put himself in the service of such Church or Government which could, or would, satisfy that need, and, in recompense, was made a soldier in their cause. The mass, the crowd, the people, found in Art none of their own human emotions, only the voice of fear, of respect, of subjection to a religious or civil authority. It was reserved for a free people, the people of Holland and Flanders, to initiate a different kind of Art. Here the Artists began to speak of the humble and obscure, and thus the *genre* Painting made its entry into the world. This modest art of simple and unassuming philosophy marks, nevertheless, a decisive moment. Art ceased finally to be only the homage rendered to the king or to the Divinity. This is the reason that Louis XIV. proscribed from his presence the democratic canvases of Teniers, Van Ostade, of Hals, of Gerard Dow, in the historic phrase: "Take all these grotesques out of my sight." But the march of time continues. Evolution goes on. Modern democracy makes its entry into the world, transforming all the conditions of society. Art also feels its effects, moral and economic. Its jurisdiction and its market has changed. The tribunal which decided on the merit of an Artist and his work was the narrow circle of moneyed mæcenas, then possibly princes, prelates, and the people of their courts. The right of judgment has now passed to the critic, to the critic by profession who suggests his own opinion to the mass, and imposes it upon the powerful. He is disinterested, thence his criterion is higher and more wide. He brings to his service a convenience of philosophic and aesthetic considerations unknown to priests and kings. The market of works of Art is to-day quite other from that in the past. In 1673 the first *Salon* was founded in Paris; and museums accessible to all are now open. Henceforth the Artist may labour according to his individual inspiration without waiting for commissions. That he may become known, he has now a place where he may exhibit his work to thousands of people, who will criticise him, and, perhaps, buy his pictures. He creates now for the great public. So the critic has become his judge, the crowd his mæcenas. Universal suffrage, having dethroned the Church and uprooted the Throne, remains the only patron of the Artist. The great revolution is, then, complete; the Artist now labours only for the crowd. Although, like the mæcenas of other times, like the princes, like the priests, the people demand that Art shall please, and flatter it, it demands also a superior satisfaction, it demands a remedy for the unrest, the spiritual uneasiness which oppresses it. Whence comes this *malaise*? It is an effect of that specialisation which is one of the most notable phenomena of modern life. The workman has become a machine, even less than a machine, a mere wheel, a simple peg. His whole being is constricted. His intelligence suffers. All his faculties, save

that he exercises daily, are paralysed and lost. Man is being degraded almost to the level of a polypus, an unreflecting zoophyte. The man of the Renaissance, on the other hand, who fascinates us all so much, was a complete creature wholly and harmonically developed. Modern man may envy, but never equal him. He must cower back into his little corner. Hypertrophy of a single faculty, atrophy of all the others, such is the destiny to which he feels himself condemned without remission. This state of things can never change. Division of labour offers too great advantage to collectivity for the latter to renounce it in favour of the individual. All feel painfully the reverse of the medal presented by Progress. A philosophy of genius, which the super-man proclaims has mastered the minds of our youth, precisely because it responds to an aspiration towards a completer individual life. And what makes anarchy attractive, even for sound consciences and tender hearts, is exactly the promise it gives of a greater total expansion of human personality. When workers demand their eight hours, the programme of the three eights of sleep, work, play, it is not at all, as malevolent minds conceive, that they may have more time to drink, but that they may have some few hours in which they cease to be pieces of mechanism; in which they may feel themselves to be men and live the great life of the world. But by what means can we restore to men, that they have lost by specialisation and division of labour, the harmonic and integral development of the various human faculties? In a far-off future, science may perhaps accomplish this miracle; then we shall see workmen gaining their livelihood by manual labour during one part of the day and spending the rest on the high peaks of thought and knowledge, as did Socrates, the mason, and Spinoza, the lens-maker. But science is difficult of access, the way thither long and rugged, and integral existence by the mediation of science is only possible to men who have attained already a higher level of development than is common among the people. On the other hand, Art at once admits the crowd to its intimacy. It does not demand, like science, a long initiation. It suffices to have senses and a human heart. After a little familiarity with masterpieces, all, or almost all, are able, if not to appreciate the technical and philosophical merits of a work, at least to feel its fascination and be thrilled by the emotion it excites. Art, then, can give to humanity to-day that of which it has the greatest need—the means of attaining the ideal life. This is the great, the sublime, function of Art in a democratic society founded on a civilisation whose characteristic feature and condition consists in a rigorous specialisation, and in division of labour pushed to the farthest limits of development. Art lifts man from the sphere of industrialism. In the field of Art man held in bondage by a machine or by his instrument of observation becomes the free, the universal man, the man living the life of the world. The function of Art in modern society is that it delivers the prisoner from the narrow prison-house of a special trade, and enables that being, reduced to the level of a piece of mechanism, to find again his human dignity.

THE undertaking of the Shoreditch Vestry in establishing combined electric lighting and dust destruction apparatus has proved a complete success, for within ten days of the opening of the station the equivalent of 7,870 lamps (eight c. p.) has been ordered. The applications in hand include one for 200 horsepower for electric motors. Under the new system, the destruction cells, fed with parish refuse, are providing the whole of the steam required for the plant installed without the use of coal.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
July 21st, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE Highways Committee of the London County Council has presented a report relative to the lighting of the Victoria Embankment and Waterloo and Westminster Bridges by electricity, and recommended the Council to take all necessary measures for establishing, at a cost not exceeding £22,000, an installation for that purpose. The recommendation was agreed to on the understanding that the Committee should report further to the Council as to the details of the proposed installation.

FRENCH sculptors have declared war against the Italian boys who offer for sale in the streets plaster copies of their works. This form of piracy not only interferes with the legitimate business of Artistic reproduction, but, by substituting a caricature for a true model, brings discredit upon the original. Since 1863 the manufacture of fraudulent imitations has been treated as a criminal offence, but it is exceedingly difficult to bring the charge home. A careful watch is kept upon the half-starved urchins whose wretched appearance serves to attract customers, and if they are accosted by suspicious persons, warning is at once given, when every trace of illicit practices vanishes at once from the workshop. The police, moreover, are hampered in their movements by the provisions of the penal code, which forbid them to take action except at the request of the author or his assignee. It is to this point that the efforts of the Artistic brotherhood are being directed.

AN important discovery of ancient British remains has been made at Danesdale, near Driffield, by Canon Greenwall, of Durham, acting under the auspices of the East Riding Antiquarian Society. At Danesdale are a number of mounds, which have been hitherto popularly known as "Danes' graves." Canon Greenwall has come to the conclusion that these graves, numbering 178, are not Danes' graves at all, but belong to an age at least a thousand years before the Conquest—that is, to about 2000 years ago, before the Roman invasion. In one of the tumuli laid bare were found not only the bones of an ancient Briton, but the iron tyre of his chariot, the iron bit and trappings of his horse, and a bronze pin, beautiful in design and enamelled. Thirteen graves were opened, all containing evidence, greater or less, of their ancient origin. The objects of interest found are to be deposited in the York Museum.

PRELIMINARY work in connection with the second block of the new Admiralty buildings has now been got through. The old houses in Spring Gardens have been cleared away, excavations have been made, and the foundations have been laid. These, as previously explained, take the form of a huge concrete tank, rendered necessary by the watery character of the soil, which at one time formed part of the bed of the Thames. In this tank, now completed, the walls of the new building are beginning to rise, and it is computed about three years will be required for the completion

of the new block. The old building will, in the meantime, undergo repairs, and on the Horse Guards side will be brought into harmony with the new structure by the erection of a dome corresponding to that which is so prominent a feature of block No. 1. The old and the new portions will then be connected by a handsome corridor running across from one to the other on the north side of the Horse Guards Parade, thus forming the fourth side of an open quadrangle.

THE structures known as dolmens, are Mr. W. C. Borlase points out in a sumptuous work he has just prepared on "The Dolmens of Ireland," chambered tombs and shrines. They are built of roughly-worked or natural stones set upright and roofed with a flagstone, thus forming a vault, and in the majority of cases they have been covered with a cairn, or mound sometimes heaped up as a large tumulus, which in the long course of time has been carried or washed away, leaving the structure exposed. A good example of a typical dolmen exists in "Kit's Cotty House," near Aylesford in Kent, and Cornwall is rich in specimens. Their distribution is shown in four maps, one for each province, the details of their character filling the whole of the first volume, and a portion of the second. Then, leaving the field for the library, Mr. Borlase proceeds to classification of the several types, and to comparison of the dolmens of the British Isles with the thousands scattered from the Atlantic to the Ganges. The concluding section treats of the Irish names and superstitions associated with stone monuments, and with sacred sites generally; and of the complex question of the dolmen-builders' ethnological affinities.

CONSIDERABLE headway is being made in the building operations in the large area abutting upon Deansgate, Manchester, which will be known in the near future as the depot of the Great Northern Railway Company for the receiving and forwarding of goods. The property acquired for the goods station, warehouse, and offices covers an immense area, hitherto mainly occupied by small dwelling-houses with a frontage of shops which fringed Deansgate. The sweeping away of these habitations will, no doubt, be a benefit to the city, and the replacement of the old shops by modern erections, with some architectural proportions and pretensions, will be a distinct improvement to the southern portion of Deansgate, and will bring it more into harmony with the upper end, which contains many handsome business premises. For considerably more than twelve months the property taken over by the railway company has been in course of demolition, and only a few buildings maintain their front against the ruthless and devastating march of the end of the century builder. Ivy Street is the point where the works commence, and thenceforward for more than a quarter of a mile the three sets of rails, which branch from the main line to the Central Station, are carried over seven massive viaducts; and gradually decline and diverge until they reach the level of the roadway in Deansgate, where there will be twelve sets of rails all told. The site of the goods station and the new buildings is bounded by Deansgate, Peter Street, Watson Street, and Great Bridgewater Street, the width being 260ft. Apart from the goods yard there is the warehouse, which will have five floors, and will be 280ft. long and 240ft. wide, and in front of this, facing Peter Street, will be the offices. A thousand men are at present engaged upon the works, and five months have been occupied in laying the foundations. For such a vast superstructure as it is intended to erect it is imperative that a solid and safe base should be secured, and in most cases the sinkings for the brick piers have been carried to a depth of 30ft., where rock has been found. These piers are composed of brick, cement, and concrete, and vary in thickness from 9ft. to 50ft., the latter being necessary to support the viaducts. In preparing for the works some important buildings have been demolished, these including the old Wesleyan Chapel in Great Bridgewater Street, the Central Board School in Gregson Street, the

burial ground in Trumpet Street, from which a large number of bodies has been removed to Philips Park Cemetery, several warehouses, and fourteen public-houses. The cost of the whole undertaking, including the contract for the new buildings, which is £346,000, is estimated at something like £1,000,000. The works were commenced in February, and will not be completed until two and a half years hence.

MR. G. FRAMPTON has, it is said, been commissioned by Mr. Passmore Edwards to execute a bronze medallion of Leigh Hunt, which is to be erected in the public library at Shepherd's Bush. This medallion will be similar to the portrait of Charles Keene, which Mr. Frampton is at present exhibiting at the Royal Academy. —The Hon. John Collier has completed his portrait of the Speaker in his State robes, which is to be placed in the Inner Temple Hall. —For the gallery in the Speaker's house Professor Herkomer has undertaken a portrait of the late occupant of the chair, Viscount Peel. This picture has been subscribed for by past and present members of the House of Commons.

COLONEL YORKE's report to the Board of Trade upon the accident at Coldrenick Viaduct, on the Great Western Railway, when twelve workmen lost their lives, has just been issued. The accident occurred during the work of replacing the wooden viaduct by a more modern structure. During the work at the seventh span of the new viaduct the staging suddenly collapsed, and twelve men were precipitated into the valley below. Colonel Yorke says that the disaster was solely due to the omission to take the most ordinary precaution to ensure that the platform was strong enough to support the weight likely to be brought upon it. The judgment of Ganger Pearce, who selected the timber for staging, was hopelessly at fault. It should not have been left to him to select the timber. Both Pearce and Blewett had every confidence in the staging. The report further says:—"Mr. Lloyd, in my opinion, failed to form a correct estimate of his duties, though it must be said in his favour that these duties had not been clearly explained to him. He relied upon the foreman on the one hand, and upon Mr. Gibbons on the other, and his statement to me shows that he did not make sufficient use of his own eyes. But knowing as he did that the men under him had more practical experience in this class of work than himself, and were themselves to work upon the scaffoldings and platforms that they erected, he should not be too severely blamed if he left them to look after their own safety in place of making this a special duty of his own."

At the monthly meeting of the Metropolitan Public Gardens' Association, 83, Lancaster Gate, W., the Earl of Meath, chairman, presiding, it was announced that the Association had completed the laying-out of St. James's Churchyard, Pentonville, by means of a grant of £600 from the City Parochial Foundation, and that the ground had been opened to the public by Captain Penton, the freeholder, that St. Matthew's Churchyard, Bethnal Green, was approaching completion, that St. Nicholas playground, Deptford, would be completed and opened shortly. Progress was reported with regard to the laying-out of the East Street site at Walworth, and it was stated that the Association had received a gift of a handsome drinking fountain for this ground from Mr. L. H. Isaacs. It was agreed to renew a previous offer to lay out Christ Church Churchyard, Blackfriars Road, and a disused burial ground in York Road, Walworth, provided their maintenance was secured. It was reported that the Bill enabling contributions to be made by various public bodies towards the acquisition of Churchyard Bottom Wood, Highgate, had passed the House of Commons, and had been read a second time in the Lords, and that the Select Committee had decided that twenty-five acres must be provided as a public open space in lieu of the Metropolitan common land the East London

Water Company proposes to take at Tottenham. It was agreed to support schemes for the preservation of vacant sites near the Essex Road, Islington, and in Wandsworth, Bromley, and other localities; and to offer prizes for the best designs for durable yet artistic drinking fountains costing not more than £50 and £100 respectively.

MR. WILTON LEE has completed the historical painting representing the laying of the foundation-stone of the new Westminster Cathedral, which is now on view at Messrs. Graves' Gallery. The vast amount of labour entailed by this great canvas (which has occupied the Artist constantly for nearly two years) may be judged from the fact that the picture contains some 700 figures of persons of eminence in the ecclesiastical and social world, who were present at the function; and for each one of these the painter had special sittings. The scene presented is the memorable procession to the high altar, the figure of Cardinal Vaughan, vested in mitre and cope, and bearing his crozier, standing out boldly in the foreground. Cardinal Logue is also strikingly portrayed, and the leading ecclesiastics and members of the Catholic nobility, grouped around, are all easily recognisable. Mr. Lee has been commissioned to paint the scene at the grand function which will attend the opening of the Cathedral.

THE President and Council of the Royal Academy have just announced their intention of electing a Cousins annuitant on August 3rd. The Cousins annuities, of which there are six or seven, owe their origin to the late Mr. Samuel Cousins, R.A., the engraver, who bequeathed, for their foundation, stock to the value of £15,500. Candidates for these pensions, which are worth about £80 a year, must be "deserving Artists, painters in oil and water-colours, sculptors, Architects, or engravers, in need of aid through unavoidable failure of professional employment or other causes." Of these annuities and the other charitable funds dispensed by the Royal Academy little is heard by the outside public, for the names of the Burlington House pensioners, among whom are numbered several once popular Artists, are never divulged. It is not generally known either that any Artist who has once exhibited at the Royal Academy is regarded as having a certain claim upon the charities of that institution should he fall upon evil days. A large sum is devoted yearly to this purpose. In 1894 no less than £1185 were disbursed in charitable donations to former exhibitors (non-members) and their families.

At the Exhibition of the Sloane-street Decorative Needlework Society, one of the most interesting and invaluable tapestries in the world may now be seen. This tapestry belongs to the York Museum, and was made as early as the year 1588 at the town of Weston, in Warwickshire. In that year Squire Sheldon, of Weston, was determined to introduce into England the art of tapestry weaving, and with that object he sent one Richard Hicks to the Low Countries to study the process, and to bring back workmen to the looms, which he set up at Weston. This tapestry is a map of Warwickshire, and is 13ft. high by 17ft. 3in. broad, exclusive of a border of 17in., which appears to be of later manufacture than the map itself. The north of this map is to the east, and the uppermost name in the left-hand corner is Swadlingcote in Derbyshire; on the right Stonesfield is the corner name, and on the lower left Fulbrook and Sudley Castle, Gloucestershire. On the north-western corner are the compass and scale of miles, above which, in the north-east corner, are the Royal Arms of England, under the house of Tudor with the Garter and supporters, lion and dragon. At the opposite corner, south-east, is a long description, quoted from Camden's "Britannia," in a square corner adorned with bears; and below this, on the south-west, the arms of Sheldon with quarterings, impaling Markham, also with quarterings. As to from what survey these maps were taken, the Rev. W. K. Bedford, M.A., is of opinion that they

were based on Saxton's maps. The spelling he admits, savours of Flemish artists, and the Orientation of the north was also a prevalent habit with Dutch geographers. The detail in this map, however, is in many cases so minute and particular that it is impossible to resist the conviction that personal observation played an important part in its formation.

As soon as Parliament is prorogued Professor Church, F.R.S., will, at the request of H.M. Office of Works, submit the two famous frescoes by D. Maclise, R.A., in the Royal Gallery at Westminster—"The Death of Nelson at the Battle of Trafalgar," and "The Meeting of Wellington and Blucher at Waterloo"—to the same restoring process which he has adopted with so much success to the other pictures at Westminster. It will be remembered that towards the close of 1895 Professor Church made a report to the Office of Works as to the cleansing and other operations which he had carried out in respect of the famous frescoes in the upper waiting hall and in the House of Lords. He also pointed out that there was no obvious change or deterioration in any of those which had been dealt with by him in the previous year, but that he feared that Maclise's two great pictures in the Royal Gallery could not fail to be further injured unless means were devised for preventing the occasional condensation of moisture upon their surfaces.

THE only Church, so far as we are aware, within the Arctic Circle is a structure of seal-skin and whalebone at Blacklead Island, Cumberland Sound, erected under the auspices of the Church Missionary Society. For about twenty years the Rev. E. J. Peck has laboured among the Eskimo, taking long journeys over the ice to reach them, crawling into their ice-huts, and teaching them by a lamp made of stone, filled with seal oil and wick made of reindeer moss; but in 1894 a new departure was taken. As the Eskimo lived in sealskin tents, Mr. Peck suggested a similar structure for a Church. So a building 20ft. long was put up for worship, the bones of whales being used as a framework. The "parsonage" house, behind it, is 20ft. long by 12ft. wide; it is in two compartments, one of which is kitchen and schoolroom, and the other sitting, dining, and bedroom combined. Canvas was subsequently substituted for sealskin. The parsonage house is also covered with canvas, and battens of timber are nailed over it to keep the canvas in position and render it warmer. On the arrival of the vessel the missionaries have so many things to store in the little house that the boxes sometimes overflow into the Church.

MR. VAN WISSELINGH generally contrives to bring an element of great interest into all his exhibitions, and the present collection, which is small, mainly consisting of four large works by Corot, well maintains his reputation in this respect. These canvases are intended for the panel decoration of a room, and are curiously unlike much of this master's work in impressionism of effect. They are all sylvan scenes, in which the principal elements consist of sky and tree studies, the decorative value of which must be seen to be understood. The colour is lighter in tone than that which the Artist usually employs, the blues running towards silver in their luminous delicacy; the greens of a light soft tone, which exactly harmonises with it. In one picture only do we get the full green and brown which is characteristic of Corot's woodland foregrounds; and in this canvas the sky is flecked with small floating clouds, the light seeming to palpitate and glow in its intensity. On another wall is a beautiful Isabey, a street brawl. There is a wealth of colour in the costumes of the combatants, which the dark background of houses and the semi-gloom brings into greater prominence. Above it hangs a delicately soft and tender sea and beach scene by J. Maris. The black and white drawings of J. F. Millet are of unusual fineness of line, and a winter scene in chalks, although somewhat lacking interest conveys the impression of a snow scene with chilling realism. To keep the Millets company are one or two of Professor Legros' strong

etchings, which have the virility and power which immediately stamp them as the work of a master. Deschamps and Rousseau are both represented by single canvases, the latter's study of a stormy evening being especially beautiful—in colour, the splendidly-realised effect of vibrating light, and grace of composition. The Deschamps is a Turkish scene, attractive, but in no way remarkable for its colour.

A SELECT COMMITTEE of the House of Lords, of which Lord Wantage is chairman, last week had under consideration the London County Council (Improvements) Bill. Mr. Freeman, Q.C., stated that the Bill was to empower the carrying out of three distinct improvements in various parts of London. The first, which was unopposed, was the construction of a suitable approach to the north side of Tower Bridge, similar to that which had been sanctioned and was now being constructed on the south side of the bridge. The next was the widening of Tottenham Court Road at the Oxford Street end by sweeping away the block of houses forming the east side of Bozier's Court, the effect of which would be that, after the carrying out of the work, the western side of Bozier's Court would become the western side of Tottenham Court Road. This improvement, counsel explained, was designed to relieve the constant block in the traffic that occurred at this locality. The chief opposition to this part of the scheme came from the Oxford Music Hall authorities, who objected to the hall being included in the area over which the betterment charge—for the betterment principle was incorporated in the Bill—was proposed to be spread. In the House of Commons it had been decided to include in the improvement area only the property adjoining or abutting upon Bozier's Court on the west side. The principal entrance to the music hall was in Oxford Street, but it had an entrance in Bozier's Court. The Council held that that entrance was part of the music hall; that it abutted on Bozier's Court; that the widening would considerably improve the entrance by giving it more publicity and affording better access; that it would therefore improve the music hall, and that therefore they were entitled to include it in the betterment area. On the other hand, the music hall authorities contended practically the only thing that abutted on Bozier's Court was the entrance, and that the hall would not be improved by the removal of the buildings. The remaining improvement was the widening of the Strand by the removal of the block of buildings between the two Churches of St. Mary-le-Strand and St. Clement Danes, forming the south side of Holywell Street. Evidence was then taken for and against the proposals, the opposition chiefly coming from the Oxford Music Hall. Eventually the Committee found the preamble proved, and directed that the Oxford Music Hall must be included in the betterment area.

It is just over two years since Mr. Woofindin died at Sheffield, leaving his residuary estate (the net value of which may be taken at about £100,000) upon trust, as to one-third part thereof, for almshouses, to be called "The George Woofindin Almshouses," and as to the remaining two-thirds parts, for a Convalescent Home, to be called "The George Woofindin Convalescent Home." The selection of sites and sanction of the Court of Chancery to the purchases and other preliminaries have necessarily required considerable time and thought, but the trustees have now so far advanced matters that they are able to give the broad outlines of their schemes. As regards the almshouses, the site selected is at the junction of Ecclesall Road and Brocco Bank, just below the new Church now being erected, and opposite the entrance to the public park at Endcliffe Woods. The area is about one and a quarter acres, with southern aspect, and includes a belt of trees, and has winding through it the Porter Brook, both advantageous for the ornamental laying out of the grounds. The trustees have concluded that the funds will be sufficient to provide and endow about twenty cottages for six married couples and fourteen

single inmates. The site selected for the convalescent home is situate at Whiteley Wood, with a southern aspect, overlooking the Whiteley Wood Valley, and contains about sixteen and three-quarter acres, and will have two general approaches from Fulwood Road and Whiteley Wood, with private footway entrances into the park, and rights to connect with the public sewer in the valley; also rights of carriage-way, &c., over the Whiteley Woods private roads. Important building restrictions have also been arranged with respect to the land lying immediately on the east and west sides of the site, and also in front on the opposite side of the valley. As regards designs for the buildings, &c., for both institutions, the trustees have decided to arrange for a public competition, which perhaps will be confined to the members of the Sheffield Society of Architects and Surveyors, and it is expected that everything will be in readiness to start building operations early next year.

THE members of the Society for the Promotion of Hellenic Studies at their annual meeting heard the not unsatisfactory report that, although the session just ended presented no very striking features, the work of the Society had been quietly and effectively carried on. A year which has discovered the "Logia" and the fragments of Bacchylides, including some complete poems, can hardly be called barren, and, as Mr. Jebb remarked, we are only yet on the threshold of the possible discoveries in Egypt. One of the most interesting incidents in an exceptionally interesting meeting was Mr. Cecil Smith's account of the work which, despite untoward circumstances, has lately been done in Athens and Melos. The Greco-Turkish war, it would seem, interrupted what would otherwise have been the most prosperous year in Hellenic excavation. Nevertheless, many important "finds" have been made—among others a further "ostrakon," bearing the name of Themistocles, and what may prove to be the site of the gymnasium of Kynosarges. A change of the law concerning antiquities, by which intending excavators in Greece will in future be required to purchase their land outright, seems likely to hamper the work of the British School at Athens, especially as proprietors have a way of believing that their land necessarily contains statues of gold. Thanks, however, to a yielding ephor, three tentative excavations have been started in Melos, and some interesting results obtained, in spite of the new law. Mr. Smith described minutely a realistic bronze statuette of the Mycenaean age, which is the largest yet found of that period. Dr. Waldstein, Dr. Sandys, and Professor Lewis Campbell were among the other speakers.

At a recent meeting of the Commissioners of Sewers Mr. Morton complained strongly of the heavy charges made by the Electric Lighting Company to private consumers, and said that the Commissioners had been badly advised in entering into the agreements in reference to the supply of the electric light in the City, and had been "taken in" all round. Some people might have made £100,000 or £200,000 out of the contract by speculation, but it was a bad bargain for private consumers. In reply to questions, Mr. Morton and others said that every effort had been made to induce the Electric Light Company to reduce their charges, but to all they had received the same reply, that it could not be done at present.

In addition to the pillar base, &c., discovered in Chester a few days ago, there has just been unearthed a Roman pillar which, from its dimensions and position, may have belonged to the base spoken of. It is 2ft. 7in. in diameter at the end, where it tapers somewhat, and where there are three holes chiselled in the position of the eyes and nose. The column projects about two yards from under the passage of the adjoining Woolpack Inn, and is evidently of considerable length, a hole bored alongside through the earth not reaching the other end. In front of the pillar was a stone wall which formed the side of a passage leading out of the Old Lightcake shop.

## Views and Reviews.

### ROCKS, ROCK WEATHERING, AND SOILS.

This treatise on rocks, rock-weathering, and soils, is a book which it has been both pleasure and profit to peruse. It purposes to deal with the principles of, and the phenomena attending upon, rock degeneration, and for this purpose it has been found necessary to first discuss rock-forming minerals, the origin, structure, and composition of rocks; the condition of the rocks before they began to disintegrate or decompose. After the description of the process of decay, an examination is made of the nature of the *débris*—the resultant materials. The entire book runs to 398 pages, and is divided into five parts. The first part, occupying 56 pages, is devoted to the constituents, physical and chemical properties, and mode of occurrence of the rocks. The second part, of 117 pages, deals with the various kinds of rocks, which it divides into the Igneous, the Aqueous, the Æolian, and the Metamorphic. The third part, the *raison d'être* so to speak of the rest of the book, consists of 113 pages, and is concerned with the weathering of rocks. It gives first the principles involved in rock weathering, the action of the atmosphere, of water and ice, of plants and animals, then a consideration of special cases, afterwards the physical manifestations of weathering and the time considerations. Part four consists of a few pages dealing with the transportation and redistribution of the rock *débris*. Part five, of 100 pages, deals with the Regolith, a name given to the resultant *débris* of weathering while in an unconsolidated state, including what is popularly known as soil and subsoil. From this we can see the general scope and character of the work, which is illustrated by photographs and explanatory diagrams. What strikes us at first, in the general arrangement of the book, is the comparatively small part devoted to the gist of the matter—113 pages out of a total of 398. We should think the author might have seen his way to some compression of the introductory parts I. and II., while we would have gladly seen more on the subject of the transportation and redistribution of the rock *débris*. There seems to us a certain lack of harmony, a difference in character between certain parts of the book which leaves us in doubt as to whether it is intended for professed students of geology or for more general readers. Some of it is eminently readable, while some is not. What we mean is that some of it, say generally, Part II. and portions of Part I., is more in the nature of a text book, giving an immense mass of information and facts, the tabulated results of chemical analyses, with the mineral and chemical composition, the structure, colour, classification, and nomenclature of every known variety of rock; all of which cannot possibly be read straight through and carried in the mind at once; while, again, other parts provide easy and most fascinating reading. We should have imagined that a book intended for the use of the geological student might have dispensed with much of the preliminary description of the various kinds of rocks; as it might have been considered that such students would have been conversant with much of the information given. On the other hand, for the general student or the casual reader, all this is, perhaps, too hard, and too technical, and would only be used for reference. Would it have been possible to have provided a general introduction, referring broadly to the general formation, composition, and mode of occurrence of the rocks—just sufficient to give the reader the point of view, to put him in sympathy with his subject, and then place the more detailed information, the tables of analyses, &c., in an appendix for reference when necessary? We speak, of course, more from the point of view of the general student, who wishes to gain a knowledge of the broad principles and facts, and to be acquainted with the inferences and conclusions drawn from them by the best minds in every branch of human endeavour, but who has neither the

time nor the necessary training to follow the reasoning in detail. We observe the author's prefatory remarks, and give our opinion with all respect to his superior knowledge of his subject. We can say without hesitation that this book appeals to us in a way that a scientific treatise rarely does, and for the reason that it somehow touches and quickens the imagination; not altogether by the inherent interest of the subject, but also by the spirit in which it is approached. It is a pleasure to us—and a pleasure that is keener by its rarity—to find in a scientific work things presented in a way that appeals to the Artist—to feel an appreciation of the poetic side of nature. We can imagine at times that we are listening to a brother Artist; a man with an appreciation of Nature's proportions and harmonies, with an eye for form and colour, and a sense of the bearing of his subject on human life and emotions; one who can feel the ghastly cruelty of Nature, as well as her smiling beneficence. This is, perhaps, why we have taken exception to the general form in which the subject is presented. It is a way we Artists have among ourselves. When we come, however, to consider the various descriptions of the different processes in Nature which are scattered through the book, we can but express our appreciation. Take, for example, the description of the action of sand drifting before the wind—the principle of the sand-blast; or, again, that of the relative rapidity of weathering among eruptive and sedimentary rocks—of particular interest to the Architect; or the description of the filling up of lakes of glacial origin, or of the formation of sea-coast swamps, or the few lines giving the origin of silicified logs. All these are presented with a simplicity and clearness which enable us to grasp instantly the whole operation; to realise to ourselves a vivid mental picture; as if we had been there, and had seen the whole process going on before our eyes. This the writer accomplishes without any attempt at "fine writing," and it argues a considerable literary skill. We notice the author seems to concur in the generally accepted geological time periods. It is not for us to presume to judge between the geologist and the physicist, who is not prepared to allow the unlimited periods of time which are assumed. We can only hope that the truth will speedily prevail, as this is one of those things that tend to cast a doubt on the conclusions of all scientific study. To the Architect in particular, whose Art requires before all others a sound physical basis—a comprehension of the construction of the earth as a whole—these differences of opinion between men who are working on different lines for the same ultimate end, are both distracting and unsettling. There is no need for us to insist on the value—or, rather, the necessity—to the Architect of the study of geology, and the knowledge of the properties of the materials with which he works. Not the least important of these properties is their varying weathering capacities. We commend this book as giving a concise and lucid explanation of the reasons and the principles which govern the various phenomena of weathering in the rocks used as building materials.

"A Treatise on Rocks, Rock Weathering, and Soils." By George P. Merrill. New York: The Macmillan Company. London: Macmillan and Co. Limited. 1897.

A NEW mission hall is to be erected in York Street, Hulme. The new building is estimated to cost about £800.

THE Glasgow Corporation proposes to spend from £8000 to £10,000 on the erection of public halls for Cowlares and Springburn.

As soon as the electric light has been installed, the clock-tower at the School Board offices on the Embankment will be illuminated at night.

THE foundation stone of the new cancer wing for Middlesex Hospital, in Nassau Street, was laid by Princess Christian on Thursday, the 15th inst. The new wing has been designed to accommodate thirty-six female patients with the necessary staff.

### OPENING OF THE NATIONAL GALLERY OF BRITISH ART.

WHEN the great building in the Grosvenor Road, now newly christened the National Gallery of British Art, is opened to-day by the Prince of Wales, London will possess a new picture gallery of high rank and ample proportions, wholly devoted to the works of British painters and sculptors. It is hardly necessary to point out once again that the nation owes this important addition to its public buildings and its Art treasures to the generosity of Mr. Henry Tate, who has not only borne unaided the entire expense of the imposing Art Palace which has so rapidly risen from its foundations, but has presented with it to the nation what is, on the whole, a splendid collection of pictures, and, above all, constitutes a nucleus round which, in time, other collections and other gifts of pictures will no doubt group themselves. In fact, this is already the case. An anonymous donor has only now presented what is, at any rate, a unique curiosity in British Art. This is a life-size equestrian portrait of a young lady, in more or less seventeenth-century costume, mounted on a beautiful silver-white palfrey. The horse, the enframing Architecture, and the foreground are by Landseer; the young lady and the attendant squire, or groom, grouped in the Van Dyck fashion, are by Millais. Moreover, Mr. Watts has given, for the inauguration, the whole series of didactic allegories exhibited this winter at the New Gallery.

#### THE BUILDING ITSELF.

though its surroundings are at present in a somewhat chaotic state, stands boldly and well. It is designed with greater attention to proportion and to harmonious balance of the general masses than most modern galleries of its type to be found in England. Wisely, considering what the London atmosphere works in a few years, there has not been any attempt at elaborate surface decoration of the outside. Such sculpture in the round and sculptural ornamentation as there is may be pronounced to be appropriate and decidedly above the average. The gallery is a Corinthian structure in the Græco-Roman style, the chief exterior feature of which is the lofty central block, with a well-proportioned Corinthian portico surmounted by a pediment, which is adorned as yet by pedimental sculpture. At the extremity of either wing are pavilions having an order of Corinthian pilasters raised on pedestals and terminating in pediments. These serve to give additional impressiveness and variety to the exterior elevation. Within they furnish octagon picture galleries, in which Mr. Watt's new gift will find a place. The main Architectural feature of the interior is a central octagon sculpture hall, with four entrances and four semi-circular niches of classic aspect for sculpture. There is a genuinely monumental character about this great hall which serves to bind together the several galleries radiating from it, even though it may be deemed to take up a disproportionate amount of room in a building of this moderate size, and yet to afford but a limited amount of space.

#### FOR THE DISPLAY OF SCULPTURE.

The models of this central octagon—for the proportions and the general conception, though not for the Architectural mouldings and the sculptural adornments—have been such Italian buildings of the fine Renaissance period as Bramante's Chapel of St. Satiro, at Milan, and still more the beautiful Oratory of St. Bernardino, by San Michele, at Verona. If the modern English example were not unduly heavy in the keystones of the arches, the capitals, and the entablature—somewhat course, in fact, in the whole working out—it would deserve still higher praise than has been accorded to it. There are seven picture galleries, three of them being 50ft. long by 32ft. wide, the Long Gallery attaining the dimensions of 92ft. long by 32ft. wide, and the Square Gallery 32ft. by 32ft. These are all fairly proportioned without being actually splendid or imposing in aspect. They are

well—almost too well—lighted from the top, the result being an illumination, on a July day, of a certain violence, which leaves no defect in a picture, no injury inflicted by time, or resulting from technique, unseen. Still, this defect is one on the right side, which it should be easy to mitigate. The walls, with the exception of the octagons, are covered with a figured, leather-like paper of a deep, rich plum-colour, which is assuredly already too dark, and will, in the course of a few years, be something like black. The octagons are at present covered with a green paper of sufficiently agreeable tone, but it is understood that this will be replaced by one of a bright red tint, in order to meet the requirements of Mr. Watts. It is in some ways a disappointment, to find that, spacious as the new galleries are, they are

#### ALREADY NEARLY FULL.

The contents are furnished as to something like a quarter by the Tate collection itself, to which, as to the La Caze collection in the Louvre, a separate gallery has been given. The Chantrey Bequest Gallery, removed from South Kensington, fills already about one-half of the whole space, the remaining quarter being occupied by the pictures now removed from the British section of the National Gallery. It is clear that, except in so far as Mr. Tate himself, or other private donors, may choose to enrich the Gallery of British Art with further gifts, it must depend almost entirely upon the additions to be made from year to year by the Royal Academy, under the Chantrey Bequest, there being no special grant at present under which the trustees and directors of the National Gallery can purchase any such additions. Here a point of the highest importance at once arises. The new gallery is a gallery of British Art, and as such is presumably meant to be representative. The Royal Academy—unless we are greatly mistaken—can only purchase under the Chantrey Bequest pictures which have appeared at one of its own annual summer exhibitions at Burlington House. This includes, for instance, Sir E. Burne-Jones, who no longer exhibits there, and does not happen to be represented in the Tate section of the collection. Now, the Pre-Raphaelite master, whatever opinion we may form as to the character and scope of his Art, is undoubtedly a representative figure among modern British painters, and he should not be omitted from any such gathering of British paintings as the present one. Moreover, there are other painters just tolerated within the walls of the Royal Academy who are nevertheless wanted to make such a display as this complete, and who nevertheless are little likely to find a place in the new British Gallery under the present conditions. Such representative men of the new schools of painting are those Glasgow impressionists, Mr. Guthrie and Mr. Lavery; then such enthusiastic seekers after novel truths as Mr. Lorimer, Mr. Frank Brangwyn, Mr. Stott of Oldham, and others who could be named. The New Pinakothek of Munich delights to honour Mr. Lavery, the Luxembourg exceptionally favours Mr. Lorimer and Mr. Brangwyn, Mr. Guthrie triumphs at the Champ de Mars and the Munich Exhibitions. In London the merits of these gifted young painters are much more grudgingly recognised. And then again, where comes in, under such an arrangement as that now foreshadowed, the arch-priest of the more refined modernism, Mr. Whistler—an adopted child in Art of Britain, and a master whom all schools alike now recognise? We recommend these points to the serious consideration of the Trustees and Directors of the National Gallery, of which central establishment the new British Gallery is a branch.

#### THE TATE SECTION

of the collection contains, with some things which are undoubtedly not worthy to be held forth to the world as representative specimens of British painting, a number of magnificent pictures, by the possession of which all Britain is made the richer. The thanks of the nation, unstintingly offered to Mr. Tate, will, no

doubt, be to him more than any official or other distinction that may be conferred upon him, well deserved as any such honour would be. A fine group of Millais's most characteristic works represent him as he is represented in no other permanent collection. Here we have the exquisite "Ophelia," a flower of his earlier pre-Raphaelite time, and a work in delicacy of execution worthy to rank with the fine productions of fifteenth century Netherlandish Art. Then the infinitely pathetic "Vale of Rest," which must count as one of his masterpieces, and the popular "North-West Passage," which, among the performances of that middle time, in which a bourgeois realism takes the place of the earlier imaginativeness, is certainly most remarkable. Other examples are the prosaic but finely-painted "Knight Delivering a Lady," the "St. Bartholomew's Day," and the quite late "St. Stephen Martyred." In another gallery, among the Chantrey Bequest pictures, appears the lamented master's latest work, "The Apparition." The Tate group of pictures includes, further, three of Mr. Orchardson's most characteristic works, "Her First Dance," "The First Quarrel," and "Her Mother's Voice." George Mason's delightful "Girl Driving Calves," until recently in Lord Leighton's collection, is also here. The last-named master's very imposing decorative canvas, "The Sea Giveth up its Dead," originally intended for St. Paul's, occupies a central position at the end of the gallery. More of such pictures are wanted in a public collection such as this, though merit is not exclusively to be measured by vastness of proportions. A graceful portrait by Hoppner, presented by Mr. Tate, is singularly out of place in its present position. Would not the generous donor consent to its being placed in the National Gallery, among its natural companions? Where, by the way, is Frederick Walker's famous "Philip in Church," which was generally supposed to form part of the Tate gift? A further enumeration of the contents of this section must be reserved for a future occasion, there being at present no catalogue to assist the memory of the visitor.

#### FROM TRAFALGAR SQUARE

have been removed, among a great number of other things, the "Virgin and St. John," of Dyce; the "Annunciation," "Beata Beatrix," of Rossetti; the "Christ Washing the Feet of His Disciples," of Ford Madox Brown; the "Harbour of Refuge" and "Vagrants," of Frederick Walker; the "Sunset Landscape," of George Mason. But why not the "Yeoman of the Guard," of Millais, and the great group of Landseers, which would be much more in their place here than in their present position at the National Gallery? MacIise, Egg, Leslie, Ward, Elmore, Frith, and many other painters of the same class, have definitely found a home in the new building. The Chantrey Bequest pictures, until quite lately hung at South Kensington, are so familiar for the most part as to need no new description. Here the moderns bravely hold their own. Mr. Sargent's "Carnation, Lily, Lily Rose," shining out among its neighbours, fills the whole room with its decorative brilliancy. Mr. Swan's "Prodigal Son," his first popular success, and perhaps still his best picture, looks better here than it did at South Kensington. The beauty of the conception is well served by the beauty and significance of the solemn colour. Spacious, and of the truest atmospheric effect, shows Mr. Adrian Stokes's large "Landscape with Cattle." All will remember Sir E. Poynter's genuinely classical "Visit to Æsculapius," Mr. Watts's spiritual "Psyche," Mr. Orchardson's only partially successful "Napoleon on Board the Bellerophon," and the late Vicat Cole's vast river piece showing the Thames below London Bridge. A protest must be raised against the hanging among the Chantrey Bequest pictures of Mr. Calderon's "St. Elizabeth of Hungary," which, though purchased by the Royal Academy, has not, unless we are greatly in error, hitherto publicly appeared among them. In the first place it is but a feeble, vacuous performance at the best. Next, the misinterpretation, or too liberal construction, of a

Latin text has caused the Artist to represent the sweet crowned saint of Hungary in most unseemly fashion, kneeling entirely naked before the altar of a chapel, under the eyes of a company of grave ecclesiastics and other spectators. Great offence was given by the picture when it first appeared, indignant protests were raised when it was purchased under the Chantry Bequest. There can be no doubt that the storm will be renewed with increased vehemence if the authorities persist in keeping the picture where it is. We have already said that the two octagon galleries will contain the

#### NEW GIFT OF MR. WATTS

to the nation, consisting of the didactic allegories which he himself classes as the most important section of his life work. When they were a few months since at the New Gallery, we had occasion to remark that we were unable to form the same high estimate of their value, judging them, as pictures must after all be judged, mainly from the pictorial standpoint. Their poetic and didactic significance is, no doubt, a high one, yet too much has been sacrificed, the boundaries of the Art have been too boldly overstepped, in order that the painter may at the same time be the preacher. These criticisms are by no means intended to apply to all the allegories, seeing that among those now presented are versions of the famous "Love and Death" and "Love and Life," besides the pathetic "Sic Transit" and the superbly-painted as well as intensely pathetic "For he had Great Possessions." These last are in every sense an important addition to the national treasures, for which every lover of what is noble in Art will offer grateful thanks to the veteran master, for whose generosity and single-mindedness it would be hard, indeed, to find a parallel, however far we look back. We shall return with pleasure to the collection when it is more definitely arranged, and the sculpture as well as the painting is in its place.—It has been officially announced at Downing Street that Mr. Charles Holroyd has been appointed by the Treasury to be Keeper of the National Gallery of British Art.

THE Liverpool Museum authorities have acquired the magnificent collection of flint implements which Mr. Seton-Karr brought home from Egypt.

IN the King's Library of the British Museum there will be on view during July an exhibition of some 300 MSS. and books dealing with the life of the English Church. The exhibition has perhaps more literary than artistic interest, but many of the exhibits contain fine specimens of illumination and wood-cutting.

A PROJECT is on foot for the restoration of the tower of Owston Church, near Doncaster. This Church is one of the most ancient and interesting ecclesiastical edifices in Yorkshire, and underwent partial restoration in 1866, but the tower has given way in the foundations, and Mr. Pearson has estimated that its restoration will cost £650.

MRS. PASSMORE EDWARDS has laid the foundation-stone of the new wing to the home at Pegwell Bay, Ramsgate, presented by her husband to the Working Men's Club and Institute Union, Clerkenwell. The enlargements have been undertaken by the union at a cost of about £5000. The new buildings will include accommodation for thirty-two additional beds, a laundry, and series of sanitary offices.

THE Secretary of State for Foreign Affairs has received despatches from Her Majesty's Consul-General at Christiania reporting that tenders are invited for the following:—By the Norwegian State Railways Administration, for the delivery of seventy-five narrow-gauge open trucks, the delivery of 100 covered goods vans, the delivery of 132 tons of stranded galvanised fencing wire, No. 5, and 96,400 iron fencing posts. Tenders for any of the above should be sent in by the 21st inst. Such further particulars as have been received with regard to these contracts may be seen at the Commercial Department of the Foreign Office any day between the hours of 11 a.m. and 6 p.m.

## Professional Items.

ABERDEEN.—The Building Committee of John Knox Free Church has approved of the plans prepared by Mr. George Coutts. A vestibule 11½ ft. wide is provided from which stairs ascend to the galleries. Nine feet is taken off the existing inside length of the Church, to make up for the reduction in the sittings, and to give more space than at present to each sitter, the accommodation required to be provided by the erection of galleries along the two sides and at one end. The plans show a much better arrangement of the seats than at present, with ample accommodation for 538 sitters on the ground floor, and 369 in the galleries, besides a large space for the choir and a baptistery, giving a total of 950 sittings. The front elevation will be hammer-blocked Kemnay ashlar, with channel-jointed pedestals and pilasters, which will be of rock-faced ashlar, with square moulded corner pinnacles and terminals on top. The other elevations will be of square-nicked rubble, for pointing. The walls and ceiling will be heightened; there will be nine windows on each side, a large wheel window in the north gable behind the pulpit, and seven exit doors. The heating is to be by hot water pipes on the Perkins system, and the ventilation by twenty air inlets in the side walls, and three exhaust ventilators in the roof. A new session-house and rooms for deacons' court and other meetings is to be erected on the open ground at the back of the schoolroom. These are also to be used as class-rooms, but the plans of them have not yet been prepared.

The structural alterations and improvements at Her Majesty's Theatre which have for some time past been in progress are now completed, and the building was reopened on Monday. The alterations made have been chiefly in connection with the entrances and exits to the theatre. The plan of reconstruction was prepared by Mr. Frank Matcham, and the work has been superintended by Messrs. Brown and Watt, Architects, Aberdeen.

The plans of the following new buildings in Aberdeen have been passed: Two houses on the east side of Albury Road, for Mr. Alexander Marr, per Messrs. D. and J. R. M'Millan, Architects; three dwelling-houses on the east side of Commerce Street, for Mr. Alexander Keith, per Mr. John Rust, Architect; dwelling-house on the west side of Chapel Street, for Mr. J. P. Farquharson, per Messrs. Brown and Watt, Architects; alterations and additions on the west side of Back Wynd, for Mr. William Jackson, per Mr. R. G. Wilson, Architect; two dwelling-houses on the north side of John Street, for Messrs. Scott and Sellar, per Messrs. W. and J. Smith and Kelly, Architects; alterations and additions at No. 12, Garden Place, for Mr. David Smith, per Messrs. W. and J. Smith and Kelly, Architects; additions at Chestnut Row, for the Belmont Laundry Company, Ltd., per Messrs. Jenkins and Marr, Architects; two dwelling-houses on the north-west side of Broomhill Road and corner of Hammerfield Avenue, for Mr. William Walker, per Messrs. W. C. Davidson and James Watt, Architects; two dwelling-houses on the east side of King Street, for Mr. David Milne, jun., per Mr. David Milne, engineer; alterations in connection with property on the west side of Fore Close, Torry, for Mr. James Farquharson, Peterhead; two dwelling-houses on the south side of Belvidere Place at its junction with Craigie Loanings, for Mr. Alexander Anderson, per Messrs. Brown and Watt, Architects (amended plan); five dwelling-houses on east side of Great Northern Road, for Mr. William Murray; dwelling-house on south side of University Road, for Mr. George Howie, per Messrs. Henderson and Son; fourteen dwelling-houses in Rubislaw Den South, for Mr. John Morgan; alterations and additions in connection with workshop and stores at Thomson's Court, Regent Quay, for Mr. George Gorrod, per Mr. William Smith, Architect; workshop on the north side of Links Street, for Mr. John Fyfe, per Messrs. Brown and Watt, Architects; two dwelling-houses on the north side of

Fonthill Road, for Mr. William Meff, jun., and Mr. Peter Dey, per Mr. Alexander Melville, Architect; two dwelling-houses on the north side of Fonthill Road, for Mr. John Stephen and Mr. William Melville, Architect, respectively, per Mr. Alexander Melville, Architect; addition to stores on the north side of Virginia Street, for Mr. William Yule, per Mr. William Smith, Architect; rebuilding of shed on the north side of Great Western Road, for Mr. James Fyfe; dwelling-house on the east side of Holland Street, for Mr. David Dunn, per Mr. Duncan Hodge, Architect; additions to Bathing Establishment at sea beach, for the Town Council, per Mr. John Rust, City Architect; dwelling-house on the south side of Church Street, Woodside, for Mr. William M'Kenzie, per Mr. George Mackie, surveyor; shed on the north side of Station Road, Woodside, for Mr. George Jamieson, per Mr. George Mackie, surveyor; dwelling-house on the west side of Ann Street, and alterations in connection with existing dwelling-houses on the west side of same street, for Messrs. J. and J. S. Watt; two dwelling-houses at the corner of Albury Road and Albury Place, for Mr. Alexander Marr, shipbroker, per Messrs. D. and J. R. M'Millan, Architects; two dwelling-houses on the south side of Fonthill Road, for Messrs. Stuart and Murray, builders (amended plan); alterations in connection with Ferryhill Free Church, Fonthill Road, for the Deacons' Court, per Messrs. D. and J. R. M'Millan, Architects (amended plan).

ASHTON-ON-MERSEY.—The foundation stone of a nurses' home at Ashton-on-Mersey has been laid by Lady Brooks. The new home is an extension of the movement commenced in Ashton-on-Mersey in July, 1889, and the scheme will be carried out at a cost of about £2000. A large proportion of this sum has been already subscribed or promised, and the movement has also been greatly helped by the gift of a site by Sir William Cunliffe Brooks.

BARNESLEY.—The Congregational Chapel, Sheffield Road, a new building erected at a cost of £1400, was opened last week. It takes the place of the old Independent Chapel, built in 1778. It has been built from designs of Mr. Geo. Moxon, and is of stone, in an early Gothic style. Approached by steps, the chapel is entered through vestibules. It has two aisles, and the open pews, like all the woodwork, are of pitchpine, stained and varnished. The building is well ventilated and lighted, and will accommodate between 400 and 500 worshippers. In addition to the cost of the new chapel, £100 is to be spent in making the old chapel suitable for a Sunday School, so that £1500 in all is needed.

BELFAST.—A large suite of buildings has been erected by Messrs. Wm. Cowan, Limited, for the purpose of a bonded warehouse on a site adjoining Great Patrick-street and Academy-street. The Architects were Messrs. Grange-Watt and Tulloch. The building is lighted by electricity, this portion of the contract having been placed in the hands of Mr. George Combe. The gas engine, which is one of the largest high-pressure engines brought to Belfast, has been supplied by Messrs. Crosley and Co., Manchester. The premises are 78 ft. long by 68 ft. in width, and are five stories in height; the total floor space is about two-thirds of an acre. In addition to the usual offices and space for vatting purposes, there is accommodation for about 10,000 casks. There are two large vats, which have respectively a capacity of 5000 and 3000 gallons. In the construction of the building about 300 piles were used for the foundations, and half a million of bricks were required, as well as some 500 cubic feet of timber. There is a commodious hoist driven by a gas engine, the latter being also utilised to drive the accumulator which provides electric light throughout the building. On three sides the building is surrounded by streets, the principal entrance being from Great Patrick-street.

BIRMINGHAM.—Some striking changes have been made in the interior aspect of Carr's Lane

Chapel. The old gallery fronts, which have been the subject of various experiments in decoration, have now been superseded by fronts of solid English oak. The decoration is brought out mainly by the contrast of two tones of oak—the polished flat surface and the dead grain of the incised ornament, with the aid of simple colours, judiciously used as accessories rather than as variants to the general effect, which is intended to suggest the fine inlays seen in old Grecian work. The seating in the body of the chapel has been simply repolished. An important change, however, has been made in the galleries. The whole of the pews have been removed, and for them have been substituted single lift-up seats, similar in structure to those with which theatre-goers are now familiar. An opera-house effect, however, has been pretty successfully avoided by making the chair-backs of plain oak. A further advantage—important in view of the crowded congregations—is the economy of space, which gives more than a hundred extra seats. The walls and ceiling have been effectively redecorated, and the iron columns and arcading introduced a few years ago to support the roof have been made to look both more ornamental and less obtrusive. These decorations have been carried out in purely Classic style. The iron girders and supports at the entrance to the body of the chapel have been hidden under fibrous plaster. Several structural alterations have also been made. Screens have been erected in the vestibule, and additional exits have been provided at the pulpit end of the chapel on each side from each of the galleries and the aisles. The chapel is now lighted by electricity, chiefly by means of light brass pendants. The internal work at the chapel has cost some £2500, but, including the structural alterations and the contemplated reconstruction of the lecture-hall, the expenditure altogether will amount to about £6000. Messrs. A. R. Dean, Limited, has undertaken the internal reconstruction and decoration. The electric light fittings are by Messrs. F. and C. Osler, and the wiring and other electrical work has been done by Mr. C. J. Moreton and Mr. E. C. Wallis.

**BRISTOL.**—The foundation stone of the library which Sir William Henry Wills, M.P., has undertaken to provide for the parish of St. George, was recently laid by Mr. Augustine Birrell, M.P. The site is on the main road, near the District Council offices, and the building, which is to afford accommodation for 300 readers at a time, with shelving for about 11,000 volumes, will be in the style of late Tudor Renaissance. It will be a single-storied building, with Cattybrook brick facings, and Ham Hill stone dressings. Wood block flooring is to be laid, and a glazed dado will surround the walls for a height of 5ft., the upper portion being of sandstone. The boys' and the library department will be separated from the public hall by an arcading of Ham Hill stone arches, supported on granite columns. The contractors are Messrs. W. Cowlin and Sons, the Architect being Mr. Frank Wills, while Messrs. Crispin and Sons have been entrusted with the heating arrangements.

**BROUGHTY FERRY.**—The extensions which have just been carried out at Grove Academy, and which have been rendered necessary by the steadily increasing number of scholars, complete the original design—although differing from it in certain respects. The addition consists in the erection of an east wing, which now takes the site formerly occupied by the old Grove Academy. To this portion the entrance is in Church Street. On the ground floor of this wing there are four class-rooms, so arranged that by means of sliding partitions two of the rooms may, if desired, be transformed into one large apartment. Accommodation has been found on the same level for the Rector's room and for a boys' lavatory and cloak-room. On the basement floor a room has been set apart for the use of the assistant teachers; another is to be utilised as the school library, of which the Corbett Library forms a nucleus; while a third apartment is reserved for the janitor. On the first floor are situated the art-room, laboratory,

and a new music-room. The south-east end of the first floor is occupied by the new laboratory, with benches for thirty-two pupils, fitted up according to the directions of Mr. Blair, H.M. Inspector of Science and Art. The lecture table occupies the west end, and the space immediately in front is seated for lecture purposes. The old laboratory has been included in the gymnasium, which is thus much more commodious than formerly; while the old art department is now utilised as a class-room. The Architects for the work were Messrs. James Maclaren and Sons, and the contractors were:—Mason, Mr. James Scott; joiner, Messrs. J. and P. Suttie; slaters, Messrs. Thomas Easton and Co.; plumber, Mr. David Brown; plasterer, Mr. James Laburn; painter, Mr. Alexander M'Leod.

**CARDIFF.**—Another new Church has been erected at Cardiff. St. Teilo's, which will serve as a chapel-of-ease for the Cathays section of St. Andrew's Parish, was commenced in February, 1895, and on Tuesday were dedicated the nave and aisles, which are the first completed parts of the general scheme for erecting a large town Church in Woodville Road. Unfortunately, it has been found necessary to build the Church in sections, of which the nave and aisles are the first. When completed, the total length of the Church will be 138ft., with seating accommodation for over 800 persons, and will comprise nave and aisles, with south porch, chancel, morning chapel, commodious vestries, and organ space. The tower, for which the foundations are already built, will be 130ft. high, the highest in the neighbourhood, and is arranged to accommodate a full peal of bells. The style selected by the Architect is Fifteenth Century English Gothic. The portion now completed provides seating accommodation for over 750 persons, chairs being used. The choir seats, pulpit, and font are of a temporary character, having been retained from the old iron Church. Externally, the walls are built of Sweldon stone, in broken coursed work, with freestone dressings, the roof being covered with green slates. Messrs. S. Shepton and Sons, of Cardiff, were the builders, the Architect being Mr. George E. Halliday, diocesan surveyor for Llandaff, whose designs were selected in a limited competition.

**CASTLETON.**—It has been decided to build a new Wesleyan chapel and school from plans prepared by Mr. H. W. Lockwood, of Sheffield. Some time since an eligible site was purchased on the Chapel-en-le-Frith Road, where the new premises will be erected. The cost is estimated at about £1800, exclusive of the land, which was paid for at its purchase.

**DERBY.**—The Waterworks Committee of the Corporation has presented the following report. On June 5th and August 7th, 1895, the Council granted the sum of £22,500 and £5500 for extensions to the existing waterworks at Little Eaton, and on March 3rd, 1897, £3000 for extending the filtering media. It has now been decided to recommend the Council, as a further addition to these works, to grant the sum of £4700 for extending the Littleover reservoir. The Sanitary Committee recommends the Council to vote £1000 for the construction of six new cells at the refuse destructor at Little Chester.

**DOUGLAS.**—At the monthly meeting of the Douglas Town Council the tender of W. J. Fargher for the erection of a block of artisans' dwellings in King Street was accepted, his quotation being £3960. For the erection of municipal buildings, public library, and fire station in Ridgway Street, the tender of Messrs. W. Gradwell and Co., Barrow-in-Furness (£10,358), was accepted. There were eight tenders in all, four English and four local.

**DUNDEE.**—Messrs. Smith Brothers have erected large premises on the south side of Murraygate. The new building has a frontage of 88ft., and the structure is five stories in height, with basement. The three uppermost flats have been let as dwelling-houses, while

the first floor will be tenanted by the Dundee Conservative Club and by an insurance company. The Architect of the building was Mr. William Alexander, and the list of contractors is as follows: Mason, Mr. R. Sheach, jun.; joiner, Mr. Alexander Young; plumber, Mr. D. Brown; plasterer, Mr. A. M' Ritchie; painters, Messrs. Petrie and Greig; slater, Mr. James Porter; heating apparatus, Mr. A. L. Peacock; electric lighting, Messrs. James Maxwell and Son.

**LEEDS.**—The representations which have been made to the Leeds Corporation by the butchers occupying shops in the Shambles to provide a dead meat market, public abattoir, and shops for retail meat dealers, recently came before a meeting of the Leeds Markets Committee, Mr. Knowles presiding. A plan for the building of a dead meat market, with abattoir adjoining, on the site known as the hay market, was provisionally adopted by the Committee. It was also decided to make inquiries as to the number of retail shops likely to be wanted, and to get an estimate of the cost of such premises.

It is highly probable that the new electric tram service from Kirkstall to Roundhay will come into operation much sooner than was expected. It is, practically, only the structure that requires urgent attention. The machinery is in a forward state. The lofty engine room has been roofed in, and one engine has been placed in position and is working. The second engine is in a fairly advanced state, and one half of its large fly-wheel is fixed. The first dynamo has been put down, tested, and approved, and might have been inserted before but for the risk of dealing with such delicate work before other matters were finished. The present engine house will accommodate two engines and a double dynamo—ample power for the Kirkstall to Roundhay service. The second engine, when absolutely fixed, will be worked, like the first one, almost continually until actual business commences. In this way good working order will be ensured. The boiler-house adjoining lacks a roof yet, and the upper floor arrangement for coaling has, of course, to be provided; but both the big Lancashire boilers by Claytons' are in position, and are supplying steam to the working engine. From the upper floor, when all is complete, the fuel will be conveyed, by means of mechanical feeders, to the furnaces. A kind of trolley-way will run out from this part of the building over the river, close by, and receive coal direct from the barges. The economiser in the storehouse next to the boiler-house is also in a forward condition. Water may thus be warmed for the boiler by heated gases, and these, when not needed, can be discharged up the shaft—another portion of the structure that is finished. Room is being left for the erection of six more engines, and four more boilers when the time comes to extend the electric tram service in other parts of Leeds.

**MOSELEY.**—A large stained-glass window, commemorative of Her Majesty's sixty years' reign, has for some time been contemplated by the congregation of St. Agnes' Church, Moseley; and from the various competitive designs submitted the award has been gained by Messrs. A. Ballantine and Gardiner, of Edinburgh. The proposed window is ranged in five lofty Gothic lights with tracery.

**NORTHWICH.**—The new technical schools are to be opened on the 24th inst. The building is the gift of Sir Joseph Verdin, Bart., D.L., and has cost from £10,000 to £12,000. Without exception, they are the best equipped schools in Mid-Cheshire. There are over 3000 square yards in the site, which fronts the London Road. An Art school, physical and chemical laboratories, laundry and cookery rooms, gymnasium, and workshops are all fitted with the most modern appliances. The Duke and Duchess of Westminster have consented to perform the opening ceremony.

**NOTTINGHAM.**—The prospectus for the session 1897-98, commencing September 3rd, in connection with the Nottingham Municipal

School of Art and Design, has just been issued, under the authority of the School of Art Committee, of which Councillor McCraith, J.P., is chairman. The session is divided into two terms, the first of which runs from September 13th to January 14th, and the other from January 17th to July 2nd, and the school will be closed from Wednesday, December 22nd, to Tuesday, January 4th, and also on Good Friday, Easter Monday and Tuesday, and Whitsuntide. The usual elementary, intermediate and advanced classes have been arranged at the Central School, Waverley Street, with others for special subjects, and branch classes for both male and female students are to be held at the Stanley Road Higher Grade, St. Ann's Well Road, Brierley Street (Queen's Walk), and Southwark (Old Basford) Board Schools, on Mondays, Wednesdays, and Fridays. The students are eligible for the gold, silver, and bronze medals, and other prizes awarded by the Department of Science and Art, London, including scholarships of the annual value of £11, £25, £52, and £104, for the Corporation prize for the best designs for lace, the Dutton Walker Art Scholarship of £15, and for other local prizes. In addition, six scholarships of £25 each are to be awarded, and seven of £7 each for evening students for the year 1897-8. The scheme for the award of free admissions to the classes to pupils of schools within the borough will again be in force, but the committee reserves the right to terminate the scheme after the examination of 1898.

SCARBOROUGH.—Building operations in Scarborough are proceeding apace. New streets are being formed to the north, the north-west and the west, and small tenements, with rentals of from £14 to £18 and £20, are occupied as soon, or sometimes before, they are completed. In connection with the purchase by Messrs. B. and W. Walmsley, of Leeds, from Mr. John W. Woodall, of Scarborough, of the estate lying between North Maine Road and Cemetery Road, and now named the Victoria Park Estate, the plans of no less than 467 new houses are before the Streets and Building Committee of the Scarborough Corporation. These, together with the plans of fifty-five other houses, make a total of 522. The plans of a Church and manse, &c., proposed to be erected at the corner of Manor Road and Gordon Street, in the North-West Ward, are also under consideration.

SEAFORTH.—The headquarters of the Bootle division of the county constabulary, hitherto established in Derby Road, within the borough of Bootle, have been transferred to the new station just completed at Seaforth. Although the erection of the new station at Seaforth commenced at the fall of 1895, and the premises should have been ready for occupation within twelve months, severe weather at first and labour disputes latterly greatly hindered progress, and the building is only now available. The station, erected by Mr. Walter Musker, contractor, Bootle, from designs by Mr. F. Holme, Architect, Liverpool, with Mr. Grocott as clerk of works, is situated in Seaforth-road, not far from the Lancashire and Yorkshire railway station. It is a two-story building, constructed of red pressed brick, relieved with red sandstone from the Bootle quarries. The frontage to Seaforth-road is 160ft., and to Lime-grove about 150ft. Opening into Lime-grove will be established a weights and measures office. In addition to the inquiry and clerical offices, the new station provides house accommodation for a superintendent, inspector, sergeant, one married constable, and eight single constables. There are also a large day room for the men, a drying room, eight cells, and two exercise yards for prisoners, stables, coachhouse, and a drill yard and shed spacious enough to accommodate from 100 to 150 men on parade. The interior walls of the cells and other rooms in the establishment are faced with a new opalesque material for which is claimed, besides brightness, superior sanitary properties. The whole of the premises will be heated by a hot water system, the apparatus being fixed in the cellar. The new block of buildings also includes a court room, magis-

trates' room, magistrates' clerk's office, and rooms for solicitors and witnesses; but these places are as yet unfurnished.

SHERINGHAM.—The new Church of St. Peter, Lower Sheringham, was recently dedicated by the Bishop of Norwich. The Church was built by Messrs. Bardell Brothers, of King's Lynn, from designs by, and under the superintendence of, Messrs. St. Aubyn and Wadling, Architects. The cost to the present time has been £7065. To this sum the cost of gas fittings and heating apparatus is to be added. Future expenses will include the addition of the vestries, the choir stalls, and the mosaic pavement in the chancel, to say nothing of an organ and pulpit.

STRATFORD-ON-AVON.—A public meeting with regard to the restoration of Shakespeare's Church was held recently at the Town Hall. The vicar (the Rev. G. Arbuthnot) presented plans and estimates in accordance with the suggestions of Mr. Bodley, the Architect who had been consulted, showing the total amount required to be £4205, but he said he understood that an item for an engine-shed was needlessly high, and that the figure might be taken at £4100. When the restoration work was commenced some years ago the estimate of the total amount required was £10,000, and of this sum £6000 had already been spent. It was made up as follows. Reconstructing the electric organ, which is at present very inefficient, £375; removal of damp, £125; new heating apparatus, £390; builders' work in connection with this, £250; reseating Church and new choir stalls, £1635; rebuilding and furnishing the vestry, £900; and new organ engine-shed, £500. After a lengthy discussion, the resolution passed at an earlier meeting authorising the committee to accept an offer from Messrs. Hill, the builders, for the repair of the organ was rescinded, and one was passed that had been suggested by Sir Arthur Hodgson, and was moved by the vicar, in his unavoidable absence. This gave the committee a free hand with regard to the organ to select what firm it liked to do the necessary work.

SWANSEA.—Last week Mr. Christopher James, Chairman of the Building and Site Committee of the School Board, laid the foundation stone of the new wing to the Terrace Road Board School. The Architect is Mr. G. T. Lawrence, and Messrs. Bennett Bros. are the contractors.

WESTHOUGHTON.—Four new windows of painted glass have been placed in St. Bartholomew's Church, all being on the south side of the nave. The whole of the work has been executed by Messrs. Powell Brothers, of Leeds.

WOLVERHAMPTON.—New public elementary schools have been erected in Leicester Street, Wolverhampton, in connection with Christ Church parish. The necessity for additional schools in the district has long been felt, and the new building, which has cost £3400, has been raised by voluntary subscriptions. Accommodation will be provided for about 630 children.

At a meeting of the Leeds School Board last week plans were approved for a new school at Armley Park to provide accommodation for 1290 children. A recommendation of the Finance and General Purposes Committee was also approved for the raising of a further loan of £41,930 from the Corporation for the erection and enlargement of schools.

At a joint meeting of representatives of the Lindsey and Holland County Councils at Boston, the engineers estimated the cost of the construction of the proposed bridge across the Witham at Langrick Ferry at £5000. It was decided to ask the Great Northern Railway Company, who are jointly concerned, if their Acts will allow them to agree to the level of the bridge being lowered, so that the cost may be lessened. The owners of the ferry, which has been in existence for many years, intimated that if the bridge was constructed and the ferry was abolished, they should claim £500 compensation for disturbance.

## SOCIETY MEETINGS.

Essex Archaeological Society.—The recent excursion of the Essex Archaeological Society to Southminster and neighbourhood proved very enjoyable. The party assembled at Southminster Railway Station. At Asheldham, by the water tower, some earthworks were visited. These are nine or ten acres in extent, and Dr. Laver explained that it was impossible to say the date of their construction; it was either British or Saxon, or it might be even Danish. Up to a few years ago this earthwork was not noticed. At Asheldham Church Mr. G. F. Beaumont read notes, and the company drove on to Bradwell-on-Sea. Luncheon was provided at the King's Head Inn, and at the close Mr. J. C. Gould read a brief sketch of the career of Sir Henry Bate Dudley. The party proceeded to "Othona," the site of a Roman camp, on which stands the ruins of St. Peter's Chapel. What remains of this old chapel, the walls of which are composed to a great extent of materials taken from the old Roman castrum, is now used as a kind of barn.

North-Eastern Sanitary Inspection Association.—The annual meeting of the North-Eastern Sanitary Inspectors' Association was held last week in the Mining Institute, Newcastle, Professor Philipson, M.D., presiding.—The Secretary (Mr. R. B. Duncan) presented the annual report of the Council. It included the following:—"The Council have pleasure in reporting that the fourteenth financial year, which closed on 30th ult., shows an income above the average, although it is less than the expenditure. Work was quieter than usual during the better part of the year, but now there is a brisk demand. The Association has recently reported on several large mansions and buildings—public schools, orphanages, workhouses, infirmaries, and asylums—one now in hand, for the Lancashire Asylums Board, has over 2000 beds. The sanitary condition of all has been, or is being, greatly improved by cure of the defects demonstrated by testing." After mentioning the question of sewage disposal, the report also dealt with the ventilation of public buildings, and spoke of the necessity of annual inspections as the only form of insurance against the evils arising from defective drainage.—Professor Philipson moved the adoption of the report, and drew attention to the steady advance which the Association has made in the esteem not only of the general public, but of the medical profession. He spoke of the great value not only of first but of succeeding annual inspections of the sanitary arrangements of houses, and drew attention to the valuable statements contained in the report regarding the ventilation of buildings, and the sanitary disposal of sewage.—Mr. Ridley seconded the adoption of the report, which was carried.—On the motion of Professor Bedson, the members of the Council were re-elected.

East Riding Antiquarian Society.—At the second summer excursion of this Society the members visited the so-called Danes' Graves at Danesdale, about four miles to the north of Driffield. Afterwards they proceeded to Kilham Church. Canon Greenwell traced the history of man in England from the Palaeolithic Age. Remains of him of that time have not been found farther north than the south of Norfolk; it was only in the Neolithic Age, or when he began to use implements of polished stone, that he was found in the north; indeed, all over the world, for recent excavations in Somaliland showed he used the same kind of implements as in England, France, and the East Indies. That they had acquired the name of Danes' Graves meant nothing. It invariably happened when first in England names were given to things, whatever was a puzzle was ascribed to one of two objects of whom they stood in awe, one was the Danes, and the other was the Devil. All had heard of the Devil's Dyke, Devil's Punchbowl, &c., and similarly they had the Danes' Dyke at Flam-borough, which General Pitt Rivers has shown must have been made by people only acquainted with flint implements, whereas the Danes per-

fectly knew the use of iron. Canon Greenwell would date the use of iron in England to between 300-200 B.C., and to them he felt inclined to ascribe the discovery of enamel. Certainly the Romans never used enamel till after their subjection of England, and they used it largely afterwards, whereas it was certain the British used enamel long before Romans came here. From the barrows he (the Canon) had opened, he declared no greater mistake could be made than to think of those who withstood Julius Caesar as painted savages, for he found their clothes had buttons, and they wore shirts, caps, and trousers. Their weapons were most artistically made, and these, with their chariots, made such an impression on Caesar that he never came back after his first attempt upon us. Such a chariot had been used against Caesar as was found in the grave now exposed to view, and, no doubt, with the bits of the horses, had been buried with the owner, that it might be at his service in the next world. Canon Greenwell gave the credit for settling this question of the Danes' Graves to Mr. J. R. Mortimer and Mr. Boynton, and he declared it was as certain as anything could be that they were graves of the Early Iron Britons.

A NEW Primitive Methodist Chapel is to be erected at Goldthorpe to cost about £360. Mr. H. Tyas, of Mexborough, is the builder.

A PULPIT, the gift of a private donor, has been erected in Holy Trinity Church, Dorchester, as a memorial to the late rector (Rev. H. Everett). The work was entrusted to Mr. Harry Hems, of Exeter.

ACCORDING to the New York Evening Post, Dr. Sven Hedin, a Norwegian, who has been exploring Persia, Turkestan, and the Pamirs, has discovered the ruins of a city buried in the sands, and containing valuable manuscripts.

THE foundation stone of a new ragged school at Blackburn has been laid by Earl Compton, M.P., president of the Ragged School Union. The building is estimated to cost £2600, and is rendered necessary by the structural unfitness of the old premises.

A FEW days ago memorial stones were laid of a new school belonging to the Methodist New Connexion Chapel, High Street Circuit, Huddersfield. In connection with the Chapel there is a Sunday School, which is now insufficient to accommodate the scholars, and it has been found necessary to erect larger premises, which it is estimated will cost £350.

THE contract for the building of the New Carr Hill Mill, Moseley, has been let to Mr. Jonathan Partington, contractor, Middleton Junction, who put up the Milton Mill. Messrs. Dorman, Long, and Co., Middlesbrough, will supply the rolled steel girders, &c. The machinery in the old place is being disposed of as quickly as possible, and it is expected that the work of demolishing the present structure will be commenced in the course of a week or so.

A NEW reredos of carved oak, designed by Mr. Douglas, of Chester, the Architect of the Church, and executed by Mr. Milson, of Manchester, was recently unveiled at St. Deiniol's Church, Criccieth. The part of the reredos immediately behind the altar consists of five panels, the centre one being of cedar, to set off the brass cross, and the other panels having the decalogue on a gilt ground. At each side of the altar are panels of tracery, reaching to within 2ft. of the side walls, and the whole is surmounted by a canopy richly carved.

A LARGE cross, which is meant to commemorate the Diamond Jubilee as well as to preserve the memory of Dwywen, has been erected on Llanddwyn Island, on the coast of Anglesey. The cross, which has been set on the highest point close to the lighthouse, is all of Anglesey marble. It stands on a base formed of three tiers, its height being 20ft. and its weight nine tons. Appropriate inscriptions have also been chiselled out on all its sides. The cross, the workmanship of which is eminently satisfactory, will be a conspicuous landmark at this traditionally interesting spot on the Welsh coast.

## Trade and Craft.

### A BUILDER FINED.

At the York Police Court, Richard Martin, builder, Lonfield Terrace, was recently summoned, at the instance of Mr. A. Crear, City Engineer, for having made additions to certain cottages in Ambrose Street, and thereby diminished the aggregate extent of the open space at the rear to less than 200ft., contrary to the bye-laws. Mr. W. H. Andrew (Town Clerk) appeared to prosecute; Mr. W. Wilkinson defended. The defendant was fined £5 and costs in each case, the first summons governing five others. The total amount of the penalty was £30 and costs.

### THE RIGHTS OF LOCAL AUTHORITIES.

Durrant v. Branksome Urban District Council was an appeal against a decision of Mr. Justice North before the Courts last week. An important question arose as to the right of local authorities, in making up new roads, to turn new surface watersewers into the natural watercourses of the basin in which those roads lie. The plaintiffs are the owners, as trustees, of the Durrant Estate, a large property, in its general character a building estate, situate partly in West Bournemouth and partly in the district of the Branksome Urban Council. The upper part of the river Bourne flows in a deep valley through the plaintiffs' property, the channel through which the river now flows being an artificial one. A portion of the valley is let to the Bournemouth Corporation for the purpose of public gardens. Owing largely to the nature of the soil, the stream, which in times of flood is liable to overflow, brings down a quantity of sand and silt, much of which is deposited in the bed of the stream and tends to choke the channel. Measures are taken by the owners of the estate, by means of "stops" or dams, and by from time to time digging out the deposited silt, to obviate the evil thus caused. The defendants have recently taken in hand the making up of a number of roads in their district, situate almost entirely in the basin of the Bourne, and in so doing have laid down new surface water drains or sewers, which discharge into the upper part of the Bourne where it flows into the Durrant Estate. The usual gullies and catchpits have been constructed, and thus stop a great deal of silt from the roads; but, especially in times of storm, a large quantity of this material is washed with the rain water into the stream. The roads thus drained by the defendants are mainly under their own jurisdiction, but are, as to a small portion—viz., the Poole road, which is a "main road"—drained by them by virtue of an agreement with the Dorset County Council. The plaintiffs complained that the increased flow caused by the defendants' works produced extra flooding and extra deposit of sand and silt, and they sought an injunction to restrain this discharge of water, sand, silt, or solid matter through the defendants' drains or other artificial works into the Bourne. Mr. Justice North dismissed the action with costs. The plaintiffs appealed. The Court dismissed the appeal with costs.

### A NEW INSULATING MATERIAL.

Almost ever since the need for electrical insulation developed itself asbestos in one form or another has been prominently known as an excellent agent for this purpose. It has been manufactured into almost every conceivable shape and by a number of different processes, resulting generally in highly useful and valuable products. It is curious that at this late day a marked improvement in methods of manufacturing asbestos insulation should come to light. It was discovered by Mr. John F. Green, general manager of the Asbestos Insulation Company, Baltimore, Md., that commercial asbestos contained a very large quantity, comparatively, of certain metallic oxides, especially of iron, and that these seriously militated against its insulating properties. After long and arduous experi-

ment a process was secured for the extraction from the crude asbestos of these oxides, the iron oxides being removed by a magnetic separator. The result is the production of an almost perfectly pure asbestos of highly marked insulating properties as compared with the ordinary commercial variety. This asbestos is manufactured into sheets or papers, using as a basis a paper composed of ordinary vegetable fibre, which is coated on both sides with the asbestos fibre. Sheets of this paper .007in. thick have withstood a tension of 2000 volts, alternating, before rupture. By placing together under great pressure a number of sheets of these papers, boards are made having very highly resistant qualities and possessing great lightness as compared with the ordinary compounds of asbestos and rubber.

### BREWERY FLOORING.

The case of Rogers v. Stuart's Granolithic Paving Company was tried at Bristol last week. The pleadings set forth that the plaintiffs were W. J. Rogers, Limited, who sought to recover damages for defects in paving executed for them by the defendants, who in their answer denied the contract alleged and the defects, adding that the defects, if any, were caused by the action of the plaintiffs. Alternatively the defendants pleaded that the construction was under the superintendence of the plaintiff's Architect, and they were therefore relieved.—Mr. Peter Stuart, managing director of the defendant Company, said he was inventor and patentee of the granolithic paving. The Company had laid down many floors in London and elsewhere for breweries. There were floors at a large grain warehouse at Avonmouth, and at the granary near the Harbour in Bristol; and the Company was going to lay floors for Messrs. W. D. and H. O. Wills' new factory. The straight joint with ordinary washing of a brewery floor would be all right, no water would go through. Generally, however, the joint became clogged with dirt; and if it was required to have the joint thoroughly water-tight, they put in a joggle joint. The better quality would be one shilling a yard more than the ordinary. Had he known that the floor was to be flooded with water as he saw it that day, a different composition would have been used. There were complaints made of the joints by Mr. Gingell, the Architect. It was not true that the cement was scamped, but more was sent round than was required. The complaint of the Architect of the hollow sound of the floor did not matter for a warehouse floor. The cause of leakage here was water being poured on the floor, which was never intended; water got to the joints and washed them out. Hot water with the washing of casks perished the cement, and was the most destructive thing that could be applied to cement mixed with beer.—George Walker, foreman in the employ of the defendants, said he had close on twenty years' experience in laying pavements. He laid the floor at the plaintiff's brewery in squares, and the materials used were of the best quality. He used a straight joint. The defendants had another joint, and he had used that for maltings at Bexhill. Not until he had finished the work at Messrs. Rogers' was he told what the floor would be used for.—No other witnesses were called for the defence, and Sir Walter Phillimore then addressed the jury for the defendants, contending that in place after place where the most important leaks were, was water from the cask washing. The cement was plentiful, and there was not the slightest reason for stinting.—Mr. Bullen replied on the evidence, and said if the plaintiffs were entitled to damages they would receive £558, as the defendants did not seem to have demurred to this if a verdict was returned for the plaintiff.—The learned judge, in summing up to the jury, said it was for them to say if the materials used answered the description represented by the sample sent down. Whether they were different from what were described in the defendant's letters it was for the jury to decide.—The jury returned a verdict for the plaintiffs for £585 2s. 8d., the full amount claimed.

A NEW library is being built at St. George, Bristol East, at a cost of £6000, the expense being borne by the member for the division, Sir W. H. Wills.

THE bursting of the reservoir at Mattewan, State of New York, was caused by the recent excessive rains. The disaster occurred at half-past two in the morning. Near Butcher's Junction the tremendous rush of the liberated water destroyed a number of boarding houses occupied by labourers, and seven persons were killed.

A NEW Free Church has been erected at Chirnside, Berwickshire. The edifice has cost between £1400 and £1500, and has been opened almost free of debt.

ANOTHER theatre is to be added to the numerous playhouses that of recent years have been built in London and its vicinity. The new building is to be erected on the north side of Harrow Road, between Westbury Road and Ranelagh Road, and will abut upon those three streets. The plans have been approved by the Paddington Vestry.

WESLEY CHAPEL, Glossop, has been reopened, having been greatly improved at a cost of nearly £500, and windows of new design, with coloured glass, have been inserted throughout.

## "TWYCLIFFE"

Patent Pedestal Syphon W.C. Basin.

A new Departure, embodying the latest developments in Sanitary Science, as applied to W. C. Basins.

Advantages claimed for the "TWYCLIFFE" Syphon:

Perfect safeguard against sewer gas and the evils arising therefrom.

Extra large water surface and great depth of water seal (3 inches) and large body of water in Basin to receive and deodorise soil.

Practically noiseless in action.

Simple in construction, reliable in action.

No complicated mechanism to get out of order.

Easily fixed as an ordinary Basin.

High-Class Article of Superior Material, Workmanship and Construction.

TWYFORDS, Ltd., Cliffe Vale Potteries, HANLEY.

## SHANKS' PATENT "COMPACTUM" WASH-DOWN CLOSET.

LARGE WATER SURFACE, 8 in. by 6 in.  
DEEP SEAL IN TRAP, 3 in.

THOROUGHLY FLUSHED WITH TWO GALLONS OF WATER.

PERFECT SEAT EXTENSION.

PORCELAIN SOLDERED JOINT.

Made in "Vitro-Porcelain," a new body, vitreous throughout, non-absorbent, and non-crazing. The best material for Sanitary Appliances ever introduced.

MR. R. O'BRIEN SMYTH, Local Government Board Inspector, recently held an inquiry in the Town Hall, Kingstown, with reference to an application of the Local Commissioners for a loan of £650 for the purpose of enlarging and improving the Town Hall.

A SERIOUS fire occurred recently at Cheddleton Asylum, which is being built by Messrs. Brown and Son, of Salford, for the Staffordshire County Council, at a cost of about £200,000. Originating in the west end of the dining hall and theatre (a splendidly timbered room, 140ft. by 60ft.), in less than half an hour the roof fell in, forcing out the east gable, and doing considerable damage to several buildings near the spot. With a brisk wind behind it, the progress of the flames was so exceedingly rapid that the building was doomed from the outset. The damage is estimated at £10,000, fully covered by insurances, effected both by the County Council and the contractors. The asylum has been in course of erection for upwards of two years, and the disaster has rendered nearly 500 men idle for the present.

## TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

**ASHFORD.**—For the construction of a covered service reservoir, water tower, &c., for the Urban District Council, Ashford, Kent. Mr. Wm. Terrill, Surveyor and Waterworks Engineer. Quantities by the Surveyor:—

MAN WANTED, not for books, cash, or ordinary correspondence; help in the practical or administrative side required.—CHARLES, Building Contractor, Thelsford Works, Moseley, Birmingham.

**LEYTON URBAN DISTRICT COUNCIL.**  
WANTED immediately, JUNIOR ASSISTANT in the Office of the Engineer and Surveyor.

Must be a good draughtsman, accustomed to keeping wages, store and stock books, and to have been trained in a municipal office.

Applications, stating age, salary required, and qualifications, together with copies of three testimonials, will be received by the undersigned.

WILLIAM DAWSON, M.I.C.E.,

Town Hall, Leyton,  
July 15th, 1897.

**URBAN DISTRICT COUNCIL of**  
HANDSWORTH (in the County of Stafford).  
APPOINTMENT OF ASSISTANT IN SURVEYOR'S OFFICE.

The Council will, at their Meeting in August next, proceed to the APPOINTMENT of an ASSISTANT in the Surveyor's Office. Salary to commence at £120 per annum, and to increase £10 yearly until it amounts to £150 per annum.

Candidates must have a good knowledge of the accounts prescribed by the order of the Local Government Board, and be competent to make surveys and prepare plans, and to discharge the other duties of the office, under the direction of the Surveyor.

Applications, in the handwriting of candidates, each stating age, present appointment, and previous experience, with three original testimonials, must be sent by post, under seal, marked "Assistant in Surveyor's Office," to me, at the Council House, Soho-road, Handsworth, on or before THURSDAY, the 29th inst.

The Committee will, after considering the applications by letter, request the attendance of such candidates as they may select, and will pay their railway fares.

Canvassing, either directly or indirectly, strictly prohibited.

By order,

E. KENWORTHY,

Council House, Handsworth, Surveyor to the Council.  
July 14th, 1897.

**QUANTITY SURVEYOR'S JUNIOR**  
ASSISTANT WANTED, who can abstract and bill neatly and correctly.—Write, stating fully experience, age, and salary required, PRICE, CUXSON, and LEIGH, Surveyors, 17, Victoria-street, S.W.

JULY 21ST, 1897.

## WORKHOUSE PLANNING.

(Continued from page xci.)

By GEORGE H. BIBBY, F.R.I.B.A.

### VIII.—ISOLATION WARDS.

THE wards for the isolation and treatment of patients suffering with fever, small-pox, or other infectious diseases, should provide an allowance for each bed of 12ft. wall space, 144ft. of floor area, and 2000ft. of cubic space. The height of the wards, therefore, with such dimensions, should be very nearly 14ft.; but some authorities prefer that the floor area should be 12ft. by 13ft., the height in that case being reduced to about 13ft. With either arrangement it will be perceived

persons, especially children, from touching each other through the railings, which, for various reasons, are preferable to walls.

The provision for isolating cases of infectious diseases is obviously more conveniently and economically to be arranged in connection with large than with small Workhouses, and the Local Government Board state that it should be considered whether arrangements cannot be made for the reception of paupers suffering from any such disease into some local public hospital for the purpose, or into the hospital provided by the Sanitary Authority under the provisions of the 131st Section of the Public Health Act, 1875, the provision at the Workhouse being in that case limited to such accommodation as may be necessary for the prompt isolation of any inmate suspected of having contracted a dangerous infectious complaint. It is very

able distance from the chief buildings of the Workhouse, and so placed that the main approaches shall be at a safe distance (the building itself being placed in a retired position). The nurses in charge should be housed in a building near to the hospital, and should not be under the necessity of intermingling with the officials or patients of the main Workhouse, and would therefore require to have a small separate administrative arrangement, containing all that is requisite for cooking, laundry, and other work.

The fever laundry should contain a receiving-room and a wash-house of moderate size, a closet for drying-horses, and ironing and finishing-room, together with a disinfecting-chamber, which latter should be placed near to the receiving-room. All these should be arranged at a fair distance from the fever hospital, &c., so as neither to create a nuisance

Fig. 8.

that the cubic spaces required are considerably greater than for the inmates of any other portion of a workhouse, and the cost per bed, therefore, proportionately increased.

The Local Government Board require that these isolation wards shall be so placed as to preclude the possibility of the spread of infection from these to other parts of the Workhouse establishment, and that every building containing infected persons, or material, shall be situated at a distance of at least 40ft. from the boundaries of the hospital site, or from any road or footpath, whether public or private. To prevent infected persons from approaching near to those in good health it is desirable that the fence of the isolation hospital airing-court should be in double lines, with a space of six or more feet between each fence, thus effectually preventing infected

important, in the opinion of the Board, that, such arrangements as those referred to should be made wherever possible.

The isolation wards should in all cases have independent provision for cooking, &c., and it is further desirable that, where practicable, the buildings should contain distinct accommodation for the safe treatment of two or more different kinds of infection, and for isolating those who may be suffering with two infectious diseases concurrently. Adequate means for disinfecting linen, clothes, bedding, &c., should be provided within a convenient distance of the isolation wards, and a detached wash-house, for cleansing infected linen, &c., should be provided; also suitable isolated residences for the fever nurses, and a fever mortuary.

For the safety of all concerned, the hospital for fever patients should be at a consider-

able distance from the chief buildings of the Workhouse, and so placed that the main approaches shall be at a safe distance (the building itself being placed in a retired position).

The Isolation Hospital shown on Fig. 8 is arranged to accommodate fourteen patients—seven of each sex—is a one-story building throughout, and contains the following apartments: A, lavatory; B, utensil closet; C, rooms for movable baths; D, water closets; E, slop closet; F, ventilation lobbies; G, wards for six beds; with central ventilating stoves at H; at J is a nurses' duty-room, with inspection windows on both sides; K is a ward for one patient; L, day-room; M, store-room; N, linen-room; O, patients' clothing; P, entrance lobby; and at R would be a covered way leading to the nurses' quarters, the fever laundry, and other adjuncts.

It has been pointed out that the isolation hospital of a Workhouse should be placed at a safe distance from the main buildings. An

authority upon the subject states that he has, in several cases, found infection communicated through some faults of administration, faults of a sort that should not have existed at a hospital, but which would have been simply inevitable if the sick had been under private management. Further, he has, in the case of smallpox, recorded instances where infection had appeared to spread from a hospital in a row of houses to other houses in a way that suggested conveyance of the infective matter through the atmosphere rather than by means of persons or things.

The practice is too common of waiting until an epidemic of disease has commenced, and then hastily running up temporary erections for hospital purposes; such buildings provide, frequently, accommodation of a very indifferent kind, and questions as to drainage, laundry-work, and other matters do not receive the attention that is necessary to make isolation perfect.

The crowding of healthy people has many dangers, but the accumulation within a confined area of a number of sick persons is far more objectionable; contamination of air and impregnation of the buildings by offensive matters are always liable to place the inmates in danger, but in an infectious hospital there are more serious risks even than these; not only attendants on the sick, but the sick themselves are liable to contract dangerous infectious disease. Such risks as these must be considered by all Architects called upon to plan isolation hospitals.

Such a hospital as is shown on Fig. 8 would provide accommodation for one infected class of patients, or (under an emergency only) perhaps the wards K and L might be temporarily used for another disease, but this would not be advisable as a rule, for even with fair separation between the various kinds of infection there must always remain a risk that patients in these hospitals might contract a second infection of a different nature, while for the nurses and officials there would be the prospect of contracting two instead of one disease. It has been shown that the risk to nurses and patients depends very much upon the suitability or otherwise of the buildings, and of their construction and management. Smallpox should always have a building to itself, away from scarlet fever and all other infections.

The out-buildings required in connection with an isolation hospital depend upon the size and special circumstances of the institution. These may consist of a mortuary, wash-house and laundry, ambulance shed, disinfecting chamber, coal and wood store. In large hospitals a porter's lodge and additional out-buildings would be advisable. In some cases a post-mortem room, provided with an adequate supply of water and proper means of drainage, is found necessary.

In all properly constructed hospitals the water-closets, dry closets, and slop-sinks should be contained in a building projecting from the main pavilion, and separated therefrom by means of a lobby (as at F on Fig. 8), and provided with a door leading into the ward, and having means of cross-ventilation by openings in its opposite side walls. Means ought to be adopted in every hospital that the current of air through the lobby cannot be stopped by the attendants or nurses (fixed louvres are suitable for this purpose). The closets and sinks may very conveniently be placed side by side, with doors facing the door leading from the lobby into the ward (see plan). The partition above the closet and sink doors should rise to the ceiling, so as to shut these offices entirely off from the lobby; but the partitions separating them from each other should not be more than about 7ft. 6in. high, so that, by means of windows placed in the opposite side walls of the projecting building, an independent cross-current of air may be secured through them. Ward sinks require to be provided with means of flushing, and water drawn from the taps, with which they are fitted, should not be used except for sink or cleansing purposes.

One or two movable baths should be provided, and in those hospitals where no special bath-room is provided, the bath may be made

to stand as shown at C on Fig. 8, over a sink to which hot and cold water has been laid on, and over which it can be emptied.

Certain administrative apartments are provided, as a rule, in a great variety of arrangements; in one story pavilions these often occupy a central position, and the least that they include should be a nurse's room fitted with fixed windows, commanding a good view of the wards, also a room in which to store such food and other articles as may be in constant use, and thirdly a linen store; but a few other rooms may be added, as shown on Fig. 8. Where no additional rooms are provided, the nurse's room may be fitted up as a ward kitchen, in which articles, such as beef-tea, &c., can be prepared or kept warm, and it should be provided with a scullery sink, an arrangement which is not considered wrong, inasmuch as nurses should not as a rule sleep in the rooms adjoining the wards.

Where visits are permitted to those patients who present dangerous symptoms, it is requisite that there should be a waiting-room provided (at the porter's lodge, or elsewhere), where the visitors may lay aside their outer garments and substitute the protection coverings which are requisite to prevent the risk of infection being carried away from the hospital. At some few hospitals, I believe, the regulations are exceptionally strict, and in certain cases visitors are required to take a bath, while their clothing is being "stoved" or disinfected.

As to the condition of a workhouse isolation hospital not more than fifteen years ago, and perhaps much less, the following extract from a Local Board Report will show a curious state of matters in the Rochford Rural Sanitary District and the Southend Urban Sanitary District, when the population of the former was about 13,000 and of the latter 8064:—

"In September, 1878, and owing to the occurrence of some cases of smallpox within their district, the Rural Sanitary Authority of Rochford took on lease, as a hospital, for a term of seven years and at an annual rental of £50, an old farm house, about half a mile from Rochford and three and a half miles from Southend. The Southend Urban Authority combined with the Rural Authority for the purpose, agreeing to pay £15 towards the rent and £10 towards certain repairs and alterations which were necessary, and which in all amounted to £35. The hospital premises include about half an acre of garden ground; they adjoin a main road, and stand about 100yds. from the nearest dwelling. The house itself, in addition to kitchen and other offices, has five rooms available for patients, these rooms severally containing from about 1125 cubic feet to 1875 cubic feet. Earth closets have been provided, the drainage is to a cesspool, and the water supply is from a well on the premises. Concerning the cesspool and the well not much information was, at the date of visit, available. The hospital has never been used since it was provided; indeed, it is admittedly looked upon as principally available for any cases of infectious diseases amongst paupers. The little furniture it contains is of the meanest description, and comes from the Workhouse. It is intended that the building shall be administered from that establishment, and it is in charge of workhouse officials. On two occasions only since 1878 does any use of the building appear to have been entertained. The first was on the occurrence, during the autumn and winter of 1879, of a severe epidemic of enteric fever at Prittlewell, in the Southend Urban District. In that case, however, the question of isolation was only raised when most of the patients were convalescent, and when the sick poor, finding themselves well cared for and nursed by private charity, refused to comply with such suggestions of removal as were made to them. In the second instance, a member of a gentleman's family having returned to Southend from a house where scarlet fever was prevalent, temporary isolation was deemed advisable, but on its being ascertained that the hospital could only be administered from the Workhouse, no further action was taken in the matter."

The funds expended upon patching up un-

suitable premises or in renting insanitary buildings for the purpose of isolation hospitals would no doubt in many instances have gone far towards providing useful institutions for the treatment of persons suffering from infectious diseases. At the present time I find that there are many Workhouses where it is desired to increase the accommodation for sick and infirm paupers, and to provide for the housing of those who may become afflicted with infectious diseases. The requirements of isolation hospitals for Workhouses are such that they must necessarily be far more costly, per patient, than the building for any other class of paupers.

(To be continued.)

## MODERN NEWCASTLE: ITS DESIGNER AND ITS BUILDER.

ATTENTION has been drawn to the dilapidated condition of the streets and roads of Newcastle in regard to the surface of the roadway, and the glaring contrast was pointed out which they offered in respect of the carriage-way compared with the fine Architecture which characterises the buildings of, at any rate, the principal streets of the city. While the paving and macadam of the streets of Newcastle are so discreditable to the reputation of the city, the public buildings which line its principal thoroughfares never fail to evoke the admiration of the stranger; but it is somewhat remarkable that even amongst the citizens themselves, however proud they may be of their fine street Architecture, the credit for this is by the general body almost wholly given to Grainger, the builder, while Dobson, the Architect, is ignored. The original projector of the new town of Newcastle, however, had he been able to carry out his designs to their full extent, would have made the streets and buildings of the town much more beautiful than they are, yet for such parts of his scheme as were adopted and put into execution honour is not given to the man in whose original brain they first found root. At an early stage of his career, and

### BEFORE GRAINGER THOUGHT OF IT,

Mr. Dobson laid before the Corporation of Newcastle a vast plan for the enlargement and improvement of the town. He it was who first proposed the purchase of Major Anderson's property, and it is much to be regretted now that the enormous scheme which he conceived was not adopted in its entirety, for, had this been done, it would have made Newcastle almost the first town in the kingdom from an Architectural point of view. It was not till some years after Mr. Dobson laid his proposals before the Corporation that Mr. Grainger took up the scheme, and, as the builder and speculator, used the genius of the Architect for his own and the town's advantage. But there is no reason on that account to speak of Grainger, as is sometimes done, as "the Architect of modern Newcastle," which is a most erroneous statement of the facts. Mackenzie's "History of Newcastle," published in 1827, thus refers to Mr. Dobson's proposal that the Corporation should purchase the two large vacant spaces in the centre of the town, which had formed the gardens of the Grey Friars and of the Nunnery of St. Bartholomew, and to convert them into a series of magnificent streets and squares:—"Mr. Dobson has proposed plans to the Corporation of Newcastle for the appropriation and purchase of Major Anderson's property in the centre of the town, which seem in the highest degree to combine elegance with utility. It is proposed to

### MAKE A GRAND SQUARE

about 430ft. long and 130ft. wide, containing in the whole 10,133 square yards, this area to be used as a public market for the sale of wheat, oats, &c., appropriate buildings to be erected on each side at a distance of 60ft. from the market; the street at the south side to commence in Pilgrim Street about 83ft. south of High Friars Lane to form the north side of the square, and passing the open space named

Green Court to open into Newgate Street south of the houses usually called Grey's Court. The street at the west side of the square is proposed to proceed from the Nun's Gate, which it would be necessary to widen, and to run in a straight line to Blackett Street, where Eldon Square would form an imposing termination. From this convenient street another is to be run along the south side of the square and to open into Pilgrim Street; the last street to commence near the portico of the new Scotch Church at Blackett Street and to terminate at the High Bridge, at which place it is proposed to widen this street by making some alterations on the south side connected with the New Flesh Market (no longer existing) and tending to make a pleasant bound to the street opposite to the east end of the New Market, where it is proposed to build a Mansion House suitable to the rank and dignity of the First Magistrate of this prosperous and opulent town. This civic palace is planned to occupy the whole of Anderson Place and to have four handsome stone fronts; the north, south, and west sides to rise from a bold terrace, and the latter front to be

ORNAMENTED WITH EIGHT BEAUTIFUL  
PILLARS.

The east front to face Pilgrim-street and to have a lofty, grand portico, capable of admitting carriages, which might enter at the gate at one corner of the grounds and pass out at the opposite one. The present walk up the avenue, with the trees on each side, to be carefully preserved. The Mansion House, the terrace, and the ground between would occupy 6300 square yards. The total extent of building ground obtained by these arrangements out of Major Anderson's present property amounts to 57,000 square yards." We may also cite from Mackenzie another bold scheme of town improvement projected by Mr. Dobson: "Mr. Dobson proposes to continue Blackett-street in a straight line crossing the foot of Gallowgate, proceeding behind Mr. Archbold's house, and cutting off part of the premises belonging to the heirs of Sir Cuthbert Heron and passing the corner of the Leazes north of the gate. Then the street to form an angle, and, crossing the Ponteland-road at the pant, to proceed in a direct line, joining the Carlisle turnpike road near to Gloucester Hall. According to these plans, this long street will be 70ft. wide, with a space of 15ft. in front of each house, making the entire space between the buildings on each side 100ft. Trees are intended to be planted on both sides of the road, which will not only break the blasts of wind, but also add to the beauty and healthiness of the streets." This short selection from the desirable proposals of Mr. Dobson serves to show how much the town would have benefited in these days had they been adopted; they indicate also how much their projector was

IN ADVANCE OF THE TIMES

and of the sleepy Corporation which rejected them. Mr. Dobson early and always had the improvement of Newcastle very close to his heart, and many other plans were drawn up by him, only to meet with disappointment. He was of too ideal and artistic a nature to cope with the financial difficulties and vested interests which stood in the way of the adoption of his schemes. It was not till some years

afterwards that Mr. Grainger, with the assistance of Mr. John Clayton, overcame the difficulties which Mr. Dobson failed to surmount. The two vacant spaces of ground were then purchased, and the undertaking was carried out, not as Mr. Dobson had originally intended, though the builder had the acumen to call in the Architect to carry out a great many of the plans for the new town. All the new streets were planned and levelled by Mr. Dobson, whose skill is particularly seen in the arrangement of Grey Street (New Dean Street, as it was first called), on the design and façade of which he spent much time and thought. His office journal for the year 1834 shows that he frequently occupied himself from three, four, and five o'clock in the morning until midnight and one o'clock the next morning in working on the plans and estimates for Grey Street and the New Markets. On July 15th that year it is recorded that "the bells of Newcastle rang out merry peals on account of the Common Council granting consent to Mr. Grainger to commence his town improvement plans," and even in the contemporary records there is little or no mention of Mr. Dobson's important share in the work, although his Architect's journal shows him to have been working

NIGHT AND DAY FOR THREE MONTHS

before on the drawings, plans, and estimates. Mr. Grainger seems from the first to have been given the lion's share of the credit. The entries in Mr. Dobson's working diaries for 1834 and 1835, indeed, are largely in reference to the new streets and markets, showing how he and his clerks worked very long hours day after day on the elevations of the streets and the plans for the buildings in them. He was at the same time busy on plans for the Markets for the Corporation, for whom he also designed the Arcade. He was busy upon the work of Grey Street from 1834 to 1837, in which period also he designed Market Street, Hood Street, Nun Street, Nelson Street, and Grainger Street, but not Grainger Street West, while earlier he had planned a portion of Blackett Street, Eldon Square, the County Club, Leazes Terrace, St. Mary's Place (with its façade so appropriate to St. Thomas's Church, which was also of his design), St. Mary's Terrace, St. Thomas's Terrace, Jesmond High Terrace, and Neville Street. Besides the Markets (the Butcher Market and Vegetable Market) in the centre of the town, Mr. Dobson also designed the Fish Market on the Sandhill (now incorporated with the Exchange). It is very satisfactory to know that, while Mr. Dobson was responsible for much that is both beautiful and useful to modern Newcastle, he had nothing to say in favour of the Town Hall being built on its present site, and nothing to do with the designing of it. He was strongly opposed to the whole idea, both of the site and of the design of the Town Hall, and no doubt the present Corporation wishes its predecessors of half a century ago had listened to his advice. It is very possible that, had it not been for Mr. Grainger taking them up, many of Mr. Dobson's plans would have been taken up by no one, and would have been

LOST TO THE TOWN.

At least they might never have been carried out to the extent they were. But, with all Mr. Grainger's enterprise and push, they

were not put into effect so completely and thoroughly as Mr. Dobson would have liked, or as would have been for the benefit of succeeding generations. But the general taste was then too low to appreciate the Architect's genius. There were few publications of authority on Architecture to which the mass of the public had access or any desire to turn. Facility of communication was limited, and the cost of travelling greater than is now the case. In those days the public purse was little applied to the encouragement of the Arts, and the modern system of Art education, so cheap as to be practically gratis, and yet the best that can be devised, was all but unknown. For an Architect in those days to attain distinction and fame which should live so long after his death implied natural talent of a very high order; but for the masses to possess taste in Art or Architecture, or discernment in mechanics or engineering, so as to understand the excellence of an eminent Architect, was next to impossible, and was, in fact, very rare. Knowing what Corporations and permanent officials are at the close of the century, we can hardly complain of them as they existed at the beginning of the Queen's reign. As early as 1814 Mr. Dobson interested himself in Tyne improvement, planning staiths, docks, &c., and in the same year he made

A SURVEY OF NEWCASTLE

which must have been extremely useful to him afterwards in designing those improvements and planning those buildings and thoroughfares which have served their purpose up to the present day, notwithstanding the advances made by the city and the increased needs of its inhabitants in every direction during the Queen's reign. He planned fortifications of Tynemouth Castle in 1820, and the following year planned a projected extension of Newcastle towards the Ponteland Road. It was in 1824 that he first proposed his gigantic scheme for the remodelling of the centre of the town, which were not taken up by Mr. Grainger till some years later, being completed in 1837 in a period of three years after the two actually set to work on them. One of the last works on which Mr. Dobson was engaged with Mr. Grainger was the building made afterwards the Central Exchange News Room, which was offered in October, 1837, to the Corporation as a Corn Market and general Exchange for the town, and rejected. It was not till the following year that the Grey Street Column, with its statue of Earl Grey, was completed; but it is interesting to note that Sept. 6th next will be the 60th anniversary of the laying of the foundation-stone of that handsome and distinctive ornament to the town by Messrs. John and Benjamin Green, the Architects, whose names are entitled to mention, along with Mr. Dobson's, in connection with the work they did for new Newcastle.

A LOCAL Government Board inquiry was held by Mr. Ducat at Radcliffe last week respecting an application of the Radcliffe District Council to borrow £13,000 for sewage works. The amount would have been much larger but for a concession granted by the Local Government Board after Colonel Mellor had raised the question in the House of Commons. An application was also made to borrow £400 for a foot-bridge across the canal.

**Are Architects  
"Unsatisfactory  
Men?"**

A CORRESPONDENT calls our attention to a case just decided before Mr. Justice Cave, at Nottingham, in which the plaintiff claimed compensation for injury to her premises by the building operations of the defendants. The case in itself is of no particular importance, but it is of interest to the Profession by reason of the large number of Architects and surveyors ranged on opposite sides, and by the remarks of the Judge in summing up. The plaintiff had the report of her Architect to the effect that the defendants' operations were practically ruining her premises, that the house was unsafe, and would have to be pulled down and rebuilt, which would cost £630. This opinion was backed up in Court by the opinions of two other Architects, and by a builder who said that, presuming it was possible to repair it at all, this would cost £307. The defence maintained that the claim was very much exaggerated, that the house was practically worn out, that some little damage was unavoidable to a rickety old house such as this, that it was now better supported than before, and that a trifling sum would be sufficient to put it into the same state of repair as it was previous to the rebuilding. This view of the matter was substantiated by an Architect and Surveyor, who said the house was fit to live in; by two others who said the necessary repairs could be done for about £40; by two more who said that no real damage had been done by the defendants' building operations, and also by a surveyor who gave evidence. Incidentally the counsel for the defence, a certain Mr. Graham, is reported to have suggested that it was a grossly exaggerated claim, got up with the object of getting the plaintiff's Architect a cheap job, and getting a new house built at the expense of the defendants. This statement should surely have been supported by proof, but it does not appear to have been, and seems to have been passed over as one of the ordinary amenities of counsel. The Judge's summing-up is worthy of quotation—he remarked that "this was one of those unfortunate cases in which they had to listen to what Architects came and told them. There were no such unsatisfactory men as Architects, for they were always at the opposite poles to one another. (Laughter.) All other scientific men tried to come to some sort of an agreement, but Architects, on the other hand, tried to contradict each other entirely. That might be due to three causes, and three causes only. Which of these causes was the correct one was not for him to say. It might be that Architecture had no science whatever about it. Secondly, there might be science in Architecture, but the witnesses who had been called knew nothing about it. (Laughter.) Thirdly, there might be science in Architecture, and these men might possess that science, but not have the honesty to tell them truly what it was. (Renewed laughter.) One or other of these things must be true, or the Architects would not be found differing so widely, as they always did, and as they had done that day. In point of fact, they helped the jury very little indeed, and they had, as far as they could, to come to a decision with as little regard to the Architects as possible." His advice seems to have been acted on. Ver-

dict for the plaintiff—damages, £175. Our correspondent thinks that the evidence is extraordinary, and certainly gave grounds for such strong remarks as were made. Judging from the report of the case before us, we are inclined to agree with him. The Judge seems to have forgotten, however, that, though there is science in Architecture, yet

in the capacity of surveyor than of Architect. Architecture should not always bear the blame. It is well known that many Architects—we might almost say all Architects in the provinces—combine surveying with Architecture. Surveying with many is the real business of their lives. It may be a convenience to combine the two, but they

TONBRIDGE FREE LIBRARY COMPETITION.

Architecture is not an exact science. There is room for differences of opinion as there is in the Law. The sciences on which Architecture rests may be exact sciences, and a man may be thoroughly versed in them, yet he applies them in accordance with his individual common sense and experience. There is always a personal equation to be considered, and in cases of this sort there is always a difficulty in exactly drawing the line between safe and unsafe; some men would be willing to take risks that others would decline. Also, he seems to have overlooked that in nearly all such cases as this the witnesses appear more

are not necessarily connected. It is evident that it is not easy to be proficient in both; the tendency is to be proficient in neither. When Architects and Surveyors pledge the reputation of Architecture in the Law Courts, this should be borne in mind. When the Judge remarked that Architects were most unsatisfactory, and that they always differed as they had done that day, he was presumably speaking from his experience of the men who usually appear in cases of ancient lights, party walls, valuations, &c., which are far more frequent than cases involving the stability of structures. It is

LIBRARY  
ENTRANCE  
BY "NORMAN"

TONBRIDGE FREE LIBRARY COMPETITION.

well known that the majority of the men who appear in such cases are surveyors, who happen to do a little building as well. We should think that it was most rare to find an Architect in the witness-box as an Architect, and giving his opinion as such on a purely Architectural matter. In this particular case "Architects and Surveyors" appeared to give their opinions on a question of stability, and also on a question of the cost of repairs. The first is a matter for Architects, the second for surveyors. On a question of stability an Architect is the best judge. We would not consent to have Westminster Abbey pulled down on the strength of a report by surveyors that it was unsafe; but on questions of valuations a surveyor is the better judge. An Architect may know, as a matter of fact most experienced men do, but it is only as a convenience; theoretically it is not their business. An Architect is a man who designs and superintends the erection of buildings to make them convenient, durable, and beautiful; the more he confines himself to his proper business the less chance there is of his finding himself in the position to have such remarks passed on him

as we have quoted. But, making all possible allowances, we hold that the proceedings in this case do reflect on the credit of Architecture. We cannot see how one man could be of the opinion that the building might collapse on its own site, though shored up, and another could say that it was perfectly safe and fit to live in. The personal equation will not explain this. There seems something wrong here. We cannot understand how the opinions of two competent and independent witnesses could vary to this extent, making every allowance for an honest difference of opinion. We yield to none in our anxiety for the honour of Architecture, and we think that honour is best maintained by speaking out plainly with regard to such cases as this. We think Architects would best consult their own dignity, and that of their Art, by keeping out of them altogether. A good land surveyor, or valuer, like a good Architect, is a man to be respected; but a mixture of all these—sometimes more than these—a man who in the nature of things cannot expect to be a specialist in either, is generally the man to be found in the Law Courts, always liable to be a discredit to whichever Profession he may happen to be representing for the time being.

#### GUILDHALL SCHOOL OF MUSIC EXTENSION.

EXACTLY twelve years ago the foundation-stone of the building in which the Guildhall School of Music carries on its work was laid, and an institution which for some five or six years had had no worthier seat for its labours than an old warehouse in Aldermanbury found itself able greatly to extend its sphere of usefulness. Now, however, the day has arrived when the constant increase in the number of students necessitates a further enlargement of the school's premises. To this end a site has been secured in the rear of the present building, and here the Corporation of London proposes to erect an extension which has been designed by Mr. Andrew Murray, the City surveyor. The foundation-stone of this new structure was laid a week ago to-day by Mr. Deputy Pearse Morrison. The extension will be in the rear of the present building, on a site which has been reserved for the purpose. The new building will have a frontage to John Carpenter Street of 72ft. 6in., and a depth of about 51ft. 6in., the area of the entire site being about 3700ft. The accommodation to be provided consists of, on the ground floor level, a handsome and commodious orchestral saloon, 47ft. wide and 55ft. long, with a properly equipped stage,

47ft. wide by 13ft. deep. In height, the saloon will be 30ft., and there will be a gallery entered at the first floor level of the school. The saloon will accommodate about 650 persons, 440 being on the ground floor, and the remainder in the gallery. Careful consideration has been given to the exits from the saloon, and altogether there will be six; four are on the ground floor, three of which doors will open direct on to the pavement in John Carpenter Street; the other two exits are in connection with the gallery. On the second, third, and fourth floors there will be in all thirty classrooms, ten on each floor. The basement will be taken up with dressing-rooms, &c., which will be in direct communication with the stage by means of a staircase at each side. The floors of the new building will be fire-resisting throughout. All the class-rooms will be warmed by means of hot water radiators, through which fresh air will be passed. No open fireplaces will be provided in the new building. The extraction of the vitiated air from the various rooms will be effected by means of trunks having valved openings near the ceiling; these trunks will be connected at each floor into a large upcast shaft at the north end of the building, and in order to generate an upcurrent in the shaft, the smoke flue from the heating chamber will be placed alongside. In summer, when this heat will be absent, the necessary current will be provided by means of a steam radiator placed at the top of the shaft. The front elevation will be carried about 22ft. higher than the present, it will be faced with Portland stone rising from a granite plinth. The style adopted will harmonise with that of the old building, which was designed by the late Sir Horace Jones. The cost of the new building, including fittings, is estimated at £20,500.

THE Church of the Holy Trinity, Shoreditch, is not "with one exception the only Anglican place of worship which is upstairs on the first floor." There are at least two English churches in East London which are upstairs. A third is shortly to be added in St. Cuthbert's, Millwall, in the parish of Christ Church, Poplar.

THE famous seminary of St. Celestin, at Bourges, has been almost entirely destroyed by fire. The magnificently decorated chapel and the valuable library were burned to ashes, but the splendid façade of the building was saved.

PLAN OF PREMISED DESIGN.

## TONBRIDGE FREE LIBRARY AND TECHNICAL INSTITUTE COMPETITION.

A REVIEW OF THE DESIGNS.  
By our Special Representative.

IT is always a pleasant task to criticise a competition which we know beforehand has been conducted fairly, and where we are assured the best plan has won. The Urban District Council of Tonbridge is to be heartily congratulated on the result of the recent competition in this respect, as well as upon the public spirit it has shown in providing the town with such useful buildings as we are sure these will prove to be. It has exhibited a vigour and an earnestness in the matter which puts to shame many a town of more than double the population of Tonbridge. This kind of spirit seems to have been in a way felt by the competing Architects, for they mustered nearly 30 strong, and have devoted considerable skill and ingenuity in dealing with a somewhat difficult though small a subject. In a word—considering the circumstances—it was undoubtedly a very strong competition, which makes it so much more disappointing that the Artistic result should be as poor as it is. There are but four designs out of the thirty which can lay any claim at all to be so described. They were submitted under the mottoes "Norma," "Art," "L'Envoi," and "N in Circle." We have placed them, we think, in order of merit, and have pleasure in specially mentioning the name of the first, which we believe to be by young Mr. Sellars, of Glasgow, who has done, as a student, some very promising work, and who this time, although his drawings are of the roughest kind and evidently made in a great hurry, proves himself to possess talent quite out of the common, but his ingenuity in planning, like some other of these Artistic competitors, is not equal to his powers of design.

The accommodation asked for in the conditions was as follows:

### TECHNICAL INSTITUTE.

Lecture Hall, 1200 to 1500 sq. ft.  
Chemical Laboratory, about 500 sq. ft.  
Carpentry and Wood-Carving Room, about 500 sq. ft.  
Two General Class Rooms.  
Three Art Rooms.  
Secretary's Office.

### FREE LIBRARY.

Public Reading Room, 1000 sq. ft.  
Library (Lending Department with Borrowers' Lobby and Counter), at least 750 sq. ft.  
Magazine Room (area not stated).  
Librarian's Store Room.  
Caretaker's Quarters and Store Rooms, Lavatories, &c.  
The limit of cost was £4000.

The problem, according to the conditions, really was to get this accommodation (on a limited site) on two floors, because it is obvious in working it out that the cube must necessarily exceed the stipulated outlay, if another floor is added.

It is on this point we feel disposed to quarrel with the award, for those competitors who realised that fact, and kept within the conditions as to cost, were handicapped all through against those who ignored them. When a definite sum is stated in the conditions, we think it should be strictly adhered to in the assessment. With this small grumble we proceed to remark upon a few of the more prominent designs.

Undoubtedly, the first premiated, under motto "Art in Circle," has won his position well by a very carefully and ingeniously thought-out plan; the general disposition of the rooms will be seen by the accompanying sketch-plan. The great merit of the library plan is that all the rooms are large and well lighted, points which compare most favourably with the other designs, and which probably went a long way to securing the author the first place. The position of the librarian, too, is worth noting, because he can not only command a good view of all the rooms—one of the conditions of the

competition—but he is so placed in front of the general entrance that all who enter the building can at once be seen by him. The technical school is also well planned, and the small courtyard at the back is an excellent idea for an entrance to such a building from a very narrow lane. The carpenters' shop (where there would necessarily be a good deal of noise) at the rear of the site could hardly be in a better position. The elevations, how-

showy and attractive manner, are if possible worse than those of the first man. They are vulgar and meretricious in the extreme, and are perhaps only equalled in the competition in that way by those under motto "Expert," even if they are not worse. "Light," which is the motto of the second premiated, has, however, some very good points in his plan, which entitles him to the just use of his *nom de plume*. We see no reason in the least why

A NOTE FROM THE DESIGN  
BY "ART"

TONBRIDGE FREE LIBRARY COMPETITION.

ever, of this set form a very strong reason why he should not be the winner. It is not so much the "workhouse plainness," as some of the Council call it, as the artlessness of the whole thing. It will be an enduring disgrace to Tonbridge if it is carried out as here proposed, and we hope, so far as regards the elevations, the Council will endeavour to get the work entirely altered. There are already signs of something of the sort we are glad to say, although we hope the alteration will not tend in the direction of the elevations of the second premiated, which, drawn perhaps in a more

"Expert" should have gained the third place; his elevations alone should have put him out of court, and there is nothing of any particular importance to recommend his plan, his *nom de plume* notwithstanding. Norman's plan is infinitely better, for example, save his winding and wasteful corridors and narrow staircases. "Art," too, which has such artistic elevations, has a well arranged plan, the librarian is well placed, but the reference room is much too small. Any one of these designs would have been better in the third place than that of "Expert."

MOTTO

(A)

Some conscientious competitors, evidently under the impression that when the conditions name £4000, that £4000 was the limit of cost, had endeavoured, and rightly so, to keep the cube down by getting all the accommodation on two floors. This necessarily means cramping some of the rooms. The plan of "N in Circle" we publish as illustrating this point. The cube, according to the author's report, is about 60,000, and this at 6d. works out to the stipulated sum. We mention this particularly, because no other design works out at so small a cube, and we think that most of the others would have some difficulty in realising their designs for the amount named.

"Melita" has a fairly good plan, with side entrances, and places his reading room in front and lecture hall over, which is not a very good arrangement. The borrowers' space is too small; the librarian is well placed, but insufficiently lighted. The chemical laboratory would not do at all, it is too long and badly shaped. This design also conscientiously provides all the accommodation on two floors, and, consequently, could be built for the money.

"A in Circle," the plan of which we publish, we think one of the best in the competition; but the elevations are heavy and ordinary, perhaps due, in a measure, to the way in which they are drawn.

"Hope" has a fair plan, with an inoffensive treatment in elevations. The lecture hall is placed on the first floor; the reading room is entered from the borrowers', which is not good. The placing of the librarian is excellent, however. The schools entrance is at the side. The defects of this plan, which is clever in some respects, are: the corridor to lecture theatre, which, at 3ft. 3in., is much too narrow; the reading room, which is much too dark and long (48ft.), and lighted only from each end one of which is an area; and the reference room, 26ft. long, with windows at one end only.

"Bonâ Fides" places lecture hall on second floor with art rooms under; they should, of course, be just reversed. The reading room, magazine room, and hall not well planned and badly lighted. The chemical laboratory is away from the lecture hall platform, which, of course, is an initial mistake.

We have had occasion to point out before, in reviewing competition designs, that there invariably appears the unconscious humorist, just as the Derby provides the undecided dog, and Henley the frail canoe. In this competition the humorists are in strong force; there are no less than four, and all very funny—there is the man who thinks the precise scantlings of his roof timbers of more importance

than his plan; and another (it would be unkind to mention mottoes), who keeps his elevation rather plainer than a barn door and infinitely less interesting, and then gravely tells the Committee it is at liberty to reduce the ornamentation if it likes! We suppose he means if it can! This last man has mistaken his work; he should have been a puzzle editor for a popular penny weekly.

BY HARRY THOMSON.

(Continued from page 363.)

THE purer practice of the Greeks and Romans was followed about the middle of the fourth century, during the spread of Christianity, by an Oriental love for splendour, and a class of work peculiarly Byzantine gradually superseded the more severe and formal treatment of earlier work, and churches and baptisteries were adorned with mosaics of grim and swarthy-visaged saints gorgeously draped on a gilded ground of glass. Though the Art progressed, little attention was paid to neatness of joint or bedding, and the manner of execution was large and coarse, the pieces of glass used being of very irregular shapes and sizes of all and every tone of colour on a prevailing ground of gold. Yet the effect was splendid, and even luxurious. Undoubtedly the influence of Byzantine feeling is observable in all Art work of this period, and that it was an influence for good is more than likely if we may judge by examples of mosaic such as that which we see in Ravenna, which is distinctly due to Byzantine influence. Of all historical work in mosaic, that which seems to fulfil most successfully the requirements of decoration is the work inspired directly through the all-powerful

### ARABIAN INFLUENCE.

The pieces of tesseral being irregular in size and shape, the effect of modelling in paint is suggested, but in a material alive and glowing with colour. As the wealth of Rome declined,

many artificers emigrated to Byzantium, where it seems glass factories were erected and mosaic and other glass made and largely used. The Byzantines followed classical models to some extent, though it must be admitted with at times a certain degree of bad taste. In the middle of the ninth century the Arts, and especially that of mosaic, were much practised, but ancient traditions had now been lost, and the style which we now know as Byzantine took the place of former work. During this time the Art flourished to some extent in Venice and Murano. The mosaics in St. Mark's were begun in 1071, and are said to have been made of Greek glass by Greek Artists, and probably this fact gave an impetus to the Art in Venice. At any rate we learn that other Artists were employed from time to time in illuminating the building within and without, till in 1159 the first Italian mosaic made by an Italian Artist was introduced into St. Mark's. From this time mosaic was much used in Italy in the decoration of churches, monuments, rooms, and furniture, and the inlay of white marble, this last being a decoration peculiarly Italian, and ultimately acquired great importance at Florence, where it is still practiced. In the general revival of interest in mosaic and glassware the workers of Murano succeeded in re-inventing the millefiori glass already referred to as having been in use in ancient Roman times. The imitation, however, was hardly so fine as the original, and, whether from carelessness or inexperience, the jointing of the glasses often very irregular. The return of the Crusaders to Europe in the year 1204 gave a fresh zest to the manufacture of mosaic, and an influx of Oriental feeling to the works produced by masters of the Art. The taking of Constantinople must have afforded the Venetians an opportunity of acquiring additional knowledge of the processes employed by the Greek glassmakers. So great was the demand for glassware in Venice, and so numerous the artisans employed in its manufacture, that in the middle of the thirteenth century codes of trade regulations were drawn up for the various sections of glass workers in the city. When the branches of the Art became well defined, the masters

BY L'ENVOI

TONBRIDGE FREE LIBRARY COMPETITION.

and workmen exercising each kind of industry banded themselves into distinct bodies with special regulations set forth in their several constitutions. The Council of the city was careful of the interests of the various craftsmen, for we read that in 1275 a law was enacted prohibiting the exportation of the sand and other substances used in the making of glass, and also of the fragments of broken glass. This prohibition was renewed in 1295, and fines were levied upon glass makers who should return to Venice after a sojourn in other States. Every encouragement to the progress of the Art was given by the Senate in the decrees passed for the protection of the interests of the different fraternities of workers in glass. The practice of the Venetians was to hand over to certain of the schools of mosaic-workers or other decorators the various portions allotted to their contract, with a stipulation that the work should be executed within a given time, the Republic employing Artists of note to make sketches and cartoons for the guidance of the mosaic workers. A charming story by George Sand, entitled "The Mosaic Workers," gives a delightful picture of the daily routine of the decorators employed

upon one of the cupolas of St. Mark's, and it may interest you to have the passage repeated, though in rather a condensed form. "With the rising of the sun the apprentices of the mosaic workers arrived at the Church, raised the ladders, selected the enamels, mixed the cement, singing and whistling and chatting in spite of the admonitions of the priestly father by their sides, himself a worker in mosaic. In the intervals of the clamour and bustle would be heard the hollow noise of the tools on the mosaic, and then the clear glassy sound of the crystals falling from the basket upon the pavement like little streams of rubies and emeralds, with now and again the sharp and piercing sound of the saw cutting the marble, while below was heard the nasal intonation of the masses repeating in the various chapels, and above all, and in spite of this confusion, the ticking of the clock, and the heavy vibration of the bells. The work having to be completed within the stipulated time, both masters and apprentices worked hard day and night to have the mosaic finished for the inspection of the examiners. A light mattress thrown on the scaffolding served for those who, overcome with fatigue, wished to taste a

few minutes of repose, interrupted by the joyous song of others, and the creaking of the boards beneath their feet; taking their repose rocked by the motion of the scaffolding, and lulled by the sound of the beetles." Leaving this little sea of romance, let us return to the dry land of historical description. As the factories of Venice rose in renown, new-born genius was added to the experience of the past, and the Art which the Byzantine Greeks had transmitted to Western Europe approached an extraordinary degree of perfection. Specimens of ancient glass were carefully sought out and carefully studied by the skilful workers of Venice and Murano, and the result of their close observation of the antique enabled them to produce those countless marvels in colour and form which still give pleasure to the uncultivated as to the most fastidious taste. They succeeded in copying all the old colours, and blended two sheets of colour in one glass; they imitated all kinds of marbled stones; they made the millefiori glass and invented Aventurine, a glass in which numerous particles of copper (or rather silicate of copper) are diffused through a yellowish transparent mass. This brings us to

#### THE SEVENTEENTH CENTURY,

during which time the manufacture of glass continued to prosper at Murano and Venice till the fall of the Republic, when the last of the grand palaces having been built and Venice having touched the zenith of her glory and greatness, she thenceforth began to decline. Her Art sank into decay, while the old masters of Venetian mosaic, whose works survive to this day, finding that the world had no longer any work for them, died out and became extinct. Their secrets died with them, and the art of mixing and colouring their glass was lost to posterity. The interruption of trade, and the decay of manufacture, compelled the subsequent remnant of glass makers to confine themselves to the production of glass beads and other articles of a common sort for domestic use. At the beginning of the seventeenth century there were three hundred glass houses in Murano; but at the commencement of the present century all were gone except a mosaic factory, which closed in 1825, but the necessity for renewing the mosaics of St. Mark's induced the government to persuade the owner to re-open his works. He afterwards made some valuable discoveries in conjunction with others interested in the revival of this beautiful Art. But money considerations, and the inability of the Government to give any effectual assistance, sadly hampered their efforts. It was when things were at this low

ebb that Dr. Salviati, a lawyer in Venice and a lover of Art treasures, turned his attention to the restoration of the mosaics of St. Mark's. It is well known that the five domes of St. Mark's were once adorned inside with glorious pictures in glass mosaic on a prevailing ground of gold. The pictures were well-nigh indestructible, but most unfortunately the building which contained them rested on a very unstable foundation, and the vaulted domes were the first to sink, and parts of the mosaic cracked and fell out. There had already been some talk of repairing these mosaics, and some attempts been made and suggestions offered in plenty, till Dr. Salviati's interest was awakened in the subject, and being convinced that Art genius is hereditary, he first looked through the golden books of the Republic, in which the names of the best masters were formerly entered, and then made enquiries in Venice and Murano, where at length he discovered certain descendants of mosaic workers, some of whom were still connected with the making of glass. These men he induced to join him in his undertaking, and a series of experiments were instituted with the object of discovering the lost secret of mixing and colouring; the result of their combined efforts being that all the

#### COLOURS OF FORMER TIMES

have been revived, with many other new intermediate tints. Indeed, the shades of colour ultimately at command numbered 22,000, and of these two or three hundred stand for flesh tints alone. The gold paste seen in the background of old mosaic was difficult to imitate, but a substitute was found by placing gold leaf on a sheet of glass, covering it with a thinner sheet of the same, and then fusing the three together. It seems, however, the process does not answer for silver so well. So far all was satisfactory, but unexpected difficulties now stood in the way—namely, the time necessary to execute the work in the old manner by inserting the mosaic piece by piece on the cemented ground. Undoubtedly a most artistic method of working, but a method suited only to the capacity of a master capable of inventing, and drawing, and colouring his own work. A substitute, however, was adopted more fitted to be executed by untrained men, requiring only technical skill, enabling the work to be done more cheaply and rapidly, and, as a consequence, with much greater economy of time and labour. The method adopted, and which is almost universally followed by those who practise the craft, is briefly this: The mosaic worker lays his cartoon or working drawing face upwards on a table. By means of a sharp hammer or chisel on an anvil or another chisel he divides his cakes of coloured glass into small cubes, and attaches each to its proper position on the drawing by means of paste or gum, till by degrees all the pieces are in situation. When all are placed, he pours over the work a fine cement, which penetrates every crack, and unites, when "set" or hard, the whole into one solid mass. The piece of finished mosaic is then turned and placed in a zinc tray, the design is washed off, and the picture appears to the eye a true copy of the original. The producing of mosaics by this method of working simplified and economised the production, the immediate result being that orders for mosaic from all parts of the world quickly flowed to

#### DR. SALVIATI'S WORKSHOPS

—this new departure from the beaten track followed by generations of mosaic workers was crowned with success, a success which all must admit was well deserved. Not content, however, with having mastered the mystery of mosaic making, Dr. Salviati turned his attention to the production of glass table ware, in imitation of the old productions of Murano and Venice, and there again his success was complete, the modern glassware of Murano even exceeding the old in delicacy of form, though, perhaps, to the critical sense somewhat inferior in beauty. Having thus far given a short outline of the history of mosaic, perhaps I may be allowed to say a few words as to its merit and place in mural decoration.

The charm of mosaic lies possibly in the paint-like texture of its surface, the brushiness, so to speak, of its execution, and in the translucency and opacity obtained at will, and the delicacy or depth and beauty of its colour. Qualities like these well fit it to the purpose of mural decoration, and its affinity to stone and marble make it a fitting companion to these materials. Its imperishability is beyond question, and its strength is that of stone. The Mediævalists used mosaic on the outer walls of buildings, and did so with impunity; for a bright sun kills colour or softens it. In our climate, however, the visitations of that luminary are less frequent than on the Continent, and a coloured mosaic decoration on our walls would probably rather offend than please us, unless, of course, its colour were kept quiet and unobtrusive, when very likely some of the charm of the material would be lost. Its adaptability to great schemes of interior decoration is a point which should not be lost sight of, but there is little chance of its being put to this use unless in our public buildings. In our dwelling houses its use will probably be confined to panels or plaques laid on the wall. But whatever its situation may be, whether on floor, wall, or ceiling, it should never seem otherwise than what it is—a decoration which harmonises with stone, marble, and wood, and no attempt should be made, I venture to think, to imitate by its means the qualities of oil painting. Mosaic need never be the servant or copier of oil painting. It is an Art which can exist as an Art by itself, an Art which can lead while

#### OTHER ARTS FOLLOW.

And now I shall have something to say of the Art of mosaic glass working, concluding with a reference to the work of John La Farge. At a very early date in the annals of Christianity coloured pattern glazing was used as a means of decoration for windows and such like purposes. The source of design and construction of glazed windows may be traced to the enamellers who practised their Art in Constantinople between the eighth and twelfth centuries. These workers in enamel understood how to make glass, for enamel is virtually glass, only generally a little more opaque, this opacity being due to the presence of oxide of tin added to the enamel material. What more reasonable, then, than to suppose that the Art of working in window glass grew from the Art of working in enamel? The different pieces of enamel are held together by soldered bands of metal, while in glass glazing the only practical difference is the substitution of the lead-flange holding each piece of glass in position. The striking similarity of these two Arts would suggest that one is a growth from the other. However that may be, the idea of

#### WINDOWS OF COLOURED GLASS

probably originated from the East, where coloured glass in Arabesque form, held in position by metal clips, was used to subdue the glare of light. This coloured glass was used in a strictly mosaic form to produce the effect of simple patterns in colour, and this was the grand step the early glass workers of Europe made when they formed the pieces of glass into a pictorial design, and made it a vehicle of artistic expression. Let us look at these Mediæval Artists at work. Upon a large table, whitened with chalk, was traced in bold outline the main divisions of the window, and the form or the outline of the design, the lines thus made representing the lead lines which were to be a guide in cutting, or rather, shaping the glass, for the use of the diamond for that purpose was then unknown. The object the designer had in view was to make the lead lines form a natural outline to the subject, and to do so with as few lines as possible, a method necessitated by the difficulty and risk of shaping the glass, which was cut or shaped with a pointed piece of red hot iron, a crack following its passage over the surface of the glass. Possibly the early workers in glass knew the limitations imposed upon the practice of their art, and though not a single quality was lost, yet they kept within their means and never attempted to overstep the limitations imposed on them; thus avoiding those elaborate failures which

some of the later glass workers have produced. And since that time great strides have been made in the Art, and quite lately in the making of glass itself, and now it is not too much to say that glass is being made which is entirely superior to anything ever made before. The beauty of the material has been recognised, and methods of shading the glass in the process of manufacture are being perfected each day—each day, in fact, bringing something newer and better than before. For the bringing about of this desirable state of things the credit must be given to John La Farge, an American Artist of great ability, who, enamoured of glass, and deserting the easel and palette, set himself to study its possibilities in the manufacture of the material itself.

#### LA FARGE

first began to experiment in the making of glass, having for a leading idea the imitations of the inlays of precious stones set in jade by Eastern Artists, the opalescence of parts contrasted with the transparency of others. After many trials, and many difficulties, and many failures, he at last, in conjunction with a clever glass maker, succeeded in the production of what is called "American opalescent glass," the quality of which is undoubtedly very fine, exceeding in delicacy, in range of colour, and richness, and depth, anything attempted before. The productions of our British School look thin, and sickly, and pale side by side with the robustness and vigour, the horny texture, of American glass. But this result is attained by a peculiar method of working the glass after it leaves the hands of the manufacturer—a method which, if not entirely new, has at least been resolved into a system under the direction of John La Farge and others of his fellow American workers in glass. To understand the difference between the American and our own rather primitive method of working, recourse must be had to a description of the manner of procedure after the cartoon drawings have been prepared. After consulting his colour sketch the Artist decides the colour scheme, and has his glass cut from paper patterns, then fastens the different pieces of glass to a sheet-glass frame by means of wax, and builds each piece, altering and amending here and there until the work is fairly satisfactory. The window is now taken down in sections, and is leaded or joined together by lead strips, and soldered in the usual manner. Finally, the glass is transferred to the upright easel, and plated; that is to say, pieces of glass are laid over the glass underneath, so as to vary the colour or its depth, or vary or direct the modelling. There seems scarcely any limit to which this "plating" or modelling can be carried, as many as five or six platings having sometimes to be made. It is this elaborate "plating" which constitutes the difference between the American method of working and ours, and a good deal can be said in its favour, for, apart from the question of appearance and quality, the permanence of the work, from the absence of paint, is unquestionable. Windows executed in this manner are necessarily very expensive, from the time, material, and care required in their execution. Working in this way dispenses almost entirely with the use of enamel paint; in figure work only the faces and hands have to be painted, and the result of the method rather that of a translucent mosaic held together by a network of metal bands. Mr. La Farge, however, being much given to experiment, has not always rigidly adhered to the mosaic theory of glass treatment, having in some cases used enamel rather freely. Among other inventions stamped, pressed, and dropped glass have been introduced; flowers, hands, and faces are modelled in relief, and other and more marvellous things will be done, I have no doubt, before we are much older.

A PIECE of freehold land in Picton Road, Wavertree, between Wells Street and Pearson Street, containing about 500 square yards, is to be purchased as the site for a technical school.

### THE HIGH CROSS OF DOWNPATRICK.

AFTER a strange, eventful history, and a long period of neglect and forgetfulness, the grand old Celtic cross of Downpatrick has been quietly re-erected in the ancient city in which it stood for so many centuries, forming as it did, and still does, the sole remaining monument of the early Christian Church that has been spared in this city. The gathering together of the scattered pieces and their re-erection is due to the energy and the liberality of some of the antiquarian members of the Belfast Naturalists' Field Club. This cross formerly stood opposite De Courcy's Castle, where the post office now is, at the cross-roads in the centre of the town, and tradition says it was brought at a remote time from the Dun, where it had been erected to one Celtchair, an Irish King. The old site is now the centre of traffic, and is very narrow, and in consequence unsuitable for the restoration. This difficulty has, however, been overcome, and the Dean and Chapter of St. Patrick's Cathedral have given a site for the cross, and it now stands erected on the grass triangular plot at the east end of the Cathedral, facing the road leading up from the city. The stones of the cross consist of the base or die, the shaft, and the arms and nimbus ring, the coping or cap stone being still undiscovered. These three stones, with an additional base stone, which was a necessary insertion owing to some injuries in the base proper, are now fitted together with care and precision, and form a cross

#### ELEVEN FEET HIGH.

No attempt of any kind has been made to restore the ornament, and, like the battle flags hung inside the Church with all their mutilations of honour, so the old cross has been erected with all the wounds and scars of the many troubles and the sad vicissitudes it has endured since it left the hands of the master craftsman in the tenth century. The base stone has no trace of ornament left. The shaft on its east face has four panels, the two centre ones each containing three full-length figures, and the upper and lower panels, which are only half the size of the centre ones, contain half-length figures, all evidently being Scriptural subjects, but now so worn as to be past recognition. The south side of the shaft has one panel its full length, containing a rich interlacing Celtic pattern closely worked at each end, and expanding to greater freedom in the centre. This is the most legible ornament on the cross. The stone above the shaft, which extends into the arms, bears in the centre the crucifixion of the Saviour, dimly visible on its weather-worn face. The angles of the cross bear evidence of having once had a round—possibly a rope—moulding, but this has suffered so much that many might consider it was splayed or chamfered. Ireland was ever

#### FAMOUS FOR ITS TOWERS AND CROSSES.

The latter rangé in hundreds from the modestly-cut sign to the impressive magnificence of the stately art of Monasterboice and Clonmacnoise, where the refined work of the Celtic chisel reached its culminating point—designs which Lord Leighton said "were produced on a different principle of form, and which display a perhaps yet higher æsthetic quality than that of the ornament which eventually displaced them." Every stone that bears a trace of Irish Art, even when they are dim with age, like these of Downpatrick, are worthy of the tenderest care and preservation. The type of the Irish cross became fixed in the ninth and tenth centuries, and flourished for three succeeding ones as a peculiarly Irish Art, and which Miss Stokes says is "the union of such primitive rhythmic designs as are common to barbarous nations, with a style which accords with the highest laws of the arts of design, the exhibition of a fine Architectural feeling in the distribution of parts, and such delicate and perfect execution, whatever the material in which the Art was treated, as must command respect for the conscientious Artist by whom the work

was carried out." The early Irish Church, under whose guardian wing this Art was protected, nourished, and brought to perfection, had its own troubles with the advent of the Norman barons, who despised the Irish, their laws, their Church, and all belonging to them, stamped them out, and substituted their own manners, customs, and their coarser grade of ornament, thus killing a refined and distinctive national Art. Willing hands have once again placed the "high cross" erect in the place that knew it of old, and it is to be hoped that the good feeling which prompted the possessors to give up the stones and the generosity of those who contributed to the restoration will prevail among all classes to preserve for Downpatrick this rich old work. The work of restoration has been carefully carried out by Mr. Wm. Hastings, builder, Downpatrick, under the supervision of Mr. William J. Fennell, Architect, Belfast.

### ELECTRICITY AND ITS DANGERS.

THE Departmental Committee appointed by the Home Secretary to inquire into certain miscellaneous dangerous trades has issued an interim report dealing with electrical generating works. The Committee—which has been aided by Major Cardew, R.E., electrical adviser to the Board of Trade, Sir David Salomons, Bart., Professor Ayrton, Dr. Hopkinson, Professor Kennedy, Professor Silvanus Thompson, Mr. F. Bailey, and Mr. James Swinburne—does not deal with electrical stations supplying currents at extra high pressure, as there is only one example of the class in this country; but with regard to the projects which, it understands, are on foot for employing 10,000 volts, or some other number constituting extra high pressure, in connection with electric railways, it is of opinion that special rules will have to be drafted and issued for the protection of the workpeople employed when the schemes have assumed a more definite shape. It appears that in electrical generating works and sub-stations during the last five years, fourteen fatal accidents have occurred, including five since since the appointment of the Committee. The danger peculiar to electrical generating works is the liability to shock, which is often fatal if, by accident, any one comes in contact with the conductors when

#### CHARGED TO A HIGH PRESSURE.

The contact need be neither very perfect nor direct. Provided two parts of the body are made to touch conductors differing in pressure by 1000 volts or more, or even by much less if the contact with the flesh is very good, a dangerous and possibly fatal shock will result. The ground, especially if damp, is sufficient for one of the contacts, damp leather boots affording no protection, so that any one standing on the ground or on a metallic or damp wood flooring cannot safely touch a single object charged to a dangerous pressure. If, however, he should be standing upon a dry india-rubber mat, which is an excellent non-conductor, he will come to no harm on touching any number of dangerously charged bodies which are at the same electrical pressure; but if he should simultaneously touch, even through his clothes, two bodies differing in pressure by about 1000 volts, or if while safely touching highly-charged metal he should touch someone else who is not also insulated, then a fatal shock may follow. In a similar manner bare overhead high-pressure conductors may lead to accident in case of breakage, or by swinging into contact with buildings, &c., or by earthing at the points of support in consequence of damage to the insulators; or they may become sources of danger to persons who unintentionally put themselves into contact with them by a ladder or other means. High-pressure overhead wire, even if insulated over their entire length, can never be considered as

#### ENTIRELY FREE FROM RISK.

With a view to ascertaining the cause of death, and devising means for resuscitation, a number

of experiments have been made from which it appears that the cause of death is arrest of the heart's action, and the best method of restoration is artificial respiration. In all cases, therefore, of apparent death from electric shock, artificial respiration should be resorted to at once, and persisted in for a considerable time, for recovery is known to have taken place after fully half-an-hour. The Committee recommends that the following regulations should be applied in the case of all stations and transformer chambers where electric currents at high pressure are generated or transformed by way of trade, for consumption by the public, or where they are used in any factory or workshop, or in any place of public resort for business or amusement, including Government establishments, shops, warehouses, and theatres, and exclusive only of private houses and premises, and of low-pressure systems:—The frames of all generators and all metal transformers shall be efficiently connected to earth, whilst the rails fencing generators shall be made of

#### NON-CONDUCTING MATERIAL.

All highly charged bodies or conductors shall be so placed, covered, or fenced with insulating material that no person may, by accidental contact, receive a dangerous shock; and the floors of all places where connection with metal at high pressure might be made shall be covered with an insulating mat. Materials used for cleaning commutator strips, &c., of dynamos, motors, or rotary converters shall be applied by means of an insulating handle. In switchrooms and on the front of switchboards all metallic parts shall be insulated, or so arranged as to render accidental contact with them impossible. The backs of all switchboards shall be kept closed except for the purpose of alteration and repair; and all switchboards erected in the future shall have at the back a clear space of at least 4ft. All aerial high-pressure conductors in factories or workshops shall either be insulated over their entire length and supported at such frequent intervals that in the event of breakage they shall not come within reach of places where persons are liable to pass or be employed, or shall be so placed and arranged as to comply with the regulations which the Board of Trade enjoins in the case of such wires in streets. Any person at work upon conductors under high pressure shall wear india-rubber gloves, to be provided by the occupier of the building, who shall see that they are in a proper state of repair and are duly worn. No mains, machines, or other apparatus shall be handled for any purpose whilst they are under high pressure, except in cases of

#### URGENT NECESSITY.

Transformer cases, iron ladders, and all permanent metallic parts contained within the transformer chamber and not forming part of the electric circuit shall be metalically connected together. All vessels used for lubricating purposes shall be so constructed that they cannot act as a conductor between the hand and anything touched. Switches which can be easily operated from outside for cutting off both the high and low pressure connections of the transformers shall be fitted in all future, and, where the Factory Inspector thinks it to be practicable, in all existing transformer chambers. Where series arc lighting is employed, means shall be provided for disconnecting each arc lamp independently of the rest. All persons engaged in electrical works shall be made fully aware of the dangerous parts of the machinery, cables, &c., and shall be instructed in methods of artificial respiration. Rules for artificial respiration and for restoration of persons apparently killed shall be affixed in every station. All accidents occurring in generating stations or transformer stations shall be notified according to the provisions of Section 18 of the Factory and Workshop Act, 1895. The Committee finally recommends that a specially qualified person be retained to advise the Secretary of State or Her Majesty's Chief Inspector of Factories on matters requiring technical knowledge of electricity.

## TECHNICAL SCHOOL FOR HYDE.

MRS. ASHTON recently laid the Foundation Stone of the new Technical School and Free Library at Hyde. In order to give additional height and air to the structure the Building Committee wisely determined to set the line of the principal facade some 20ft. back from the line of frontage to Union Street. The style of Architecture adopted is a free treatment of the English Renaissance. Messrs. Woodhouse and Willoughby's design was selected in a limited competition of Architects, who have given this kind of work special study, on the advice of the assessor chosen by the Committee, viz., Mr. Thomas Worthington, of Manchester. The building is divided in two sections, a Public Free Library in the one, and a Science, Art, and Technical School in the other. The following accommodation is provided:—The Public Library is central, having perfect supervision of the adjacent rooms, also in itself having ample storage room for books and papers. The lending department is, both top and side lighted, and will provide ample accommodation for at least 14,000 volumes. A large public reading room, with bays and recessed fireplace ingie, is also provided, together with news room, librarian's office, general store room for periodicals and newspapers, cataloguing and repairing room, a separate room for specifications of patents, as well as suitable lavatory accommodation and conveniences for the staff.

## THE TECHNICAL SCHOOL

portion of the structure comprises on the basement floor ample provision for the teaching of cookery, dressmaking, laundry work, and Art modelling, store-room for cycles, together with suitable cloak and lavatory accommodation, and space for heating boilers, coal, coke, &c. On the ground floor large class-rooms are obtained for the teaching of commercial subjects, committee-room, secretary's room, together with ample lavatory and other accommodation. The building is approached by two main entrances from this floor with a vestibule to each, one facing Union Street, and one the new street, communicating with spacious corridors by wide and easy fireproof staircases to every floor. The first floor is apportioned entirely to the study of science and Art, the following rooms being provided: Elementary Art room, advanced Art room, Art master's own room, elementary drawing room, physical laboratory, large chemical laboratory for forty students, together with sulph. hydro. room, balance and re-agent rooms, combustion room, master's room, and a large lecture theatre provided with a raised gallery to seat 100 students, also preparation room, store-room, lavatories, &c., in conjunction thereto. The chemical laboratory, as well as the lecture theatre, will each be entered through double doors, having open timbered roofs to ensure height and additional air space, and well lighted by large mullioned and transomed windows, all matters so essential in rooms devoted to chemical studies. The Art rooms are principally "north lighted," with windows as free as possible from divisional bars. These rooms being approached directly from the landing of the principal staircase, are so arranged that they can be used for exhibitions of pictures, prize distributions, &c., by the movable partitions dividing same being thrown back and thus forming one large room. The building throughout will be warmed with hot water on the low pressure system, and careful attention also has been given to the ventilation, the vitiated air being extracted by means of trunks, &c., in the ceiling, connected with exhaust ventilators on the roofs and in the main turret. With regard to the material to be used, all exposed internal joinery is to be executed in carefully selected pitch pine, slightly stained and varnished, the floors of corridors, passages, &c., being wood blocks laid on concrete, while the entrance halls will be paved with ceramic mosaic of simple design. The principal elevations are designed to be faced with machine-made red Ruabon bricks, having all dressings and enriched work

carried out in Doulton's Rowley Regis, "biscuit coloured" Terra Cotta, the enriched panels, borough arms over principal entrance, doorway, &c., being modelled from cartoons supplied by the Architects, and executed under their personal supervision. The whole of the roofs are to be covered with Westmoreland "sea green" slates of approved quarry and size, finishing at the apex with a red Ruabon ridge tile. The erection of the works has been placed in the hands of Messrs. S. Robinson and Son, contractors, of Hyde, from the designs and under the supervision of Messrs. Woodhouse and Willoughby, Architects, of Manchester and Stockport. It is estimated that the structure will take about fifteen months to complete at the total cost of about £12,000 including equipment.

## MORE ABOUT THE IRISH CHANNEL TUNNEL.

A DEPUTATION representing Ulster and the south-west of Scotland had an interview with Mr. Ritchie at the Board of Trade recently to ask the Government to contribute £15,000 for borings and soundings between the north of Ireland and the south coast of Scotland to determine the practicability of making a channel tunnel. The President was accompanied by Sir Courtenay Boyle, the Hon. T. W. Pelham, Sir George Nares, Mr. Walter Howel, and Mr. Garnham Roper. The deputation consisted of Mr. Arnold Forster, M.P., Sir James Haslett, M.P., Mr. William Johnston, M.P., Mr. Wolff, M.P., Mr. S. Young, M.P., Major-General M'Calmont, M.P., and Colonel James M'Calmont, M.P. Mr. Arnold Forster, M.P., Mr. Lyle Knox (the President of the Belfast Chamber of Commerce), Mr. James M'Connell, Mr. Wolff, M.P., and Mr. S. Young, M.P., having spoken, Mr. Harrison Hayter (the past President of the Institution of Civil Engineers) briefly explained the scheme. He said there was a striking similarity between the Irish Channel tunnel scheme and the English Channel tunnel scheme as to length and gradients. The only difference was that the Irish Channel tunnel was rather deeper water, and the strata, instead of being chalk, consisted of

## SILURIAN ROCKS AND RED SANDSTONE.

A sum of £15,000 was wanted to make borings and soundings and a survey. The next step would be an expenditure of £200,000 to sink a shaft and drive a heading, and if this were done it would completely set at rest the practicability of the undertaking. Mr. Barton, C.E., said there had been four different routes for this channel tunnel examined, but they wanted to make further investigations of the strata. It was estimated that any of these four routes would cost between £8,000,000 and £10,000,000. Mr. Ritchie, in reply, said that practically what the deputation were asking the Government to do was to commit themselves to a considerable expenditure in order to endeavour to improve the communications between the north of Ireland and the south of Scotland. Everybody would acknowledge that a tunnel *per se* was a desirable thing to have as a mode of communication between the two countries. But in this case there were two questions involved. One as to whether the tunnel was reasonably practicable, and, if so, where was the money to come from. So far as the practicability was concerned the matter of expense formed a very important element. The amount required had been mentioned as between £8,000,000 and £10,000,000, but he had seen estimates much higher than that, one reaching to £16,000,000. It was just one of those things which even the most practical engineer would have great difficulty in giving a reliable estimate about. Reference had been made to the fact that other tunnels had been successfully made; but he had never yet heard of any tunnel being made under the sea at such a depth from low-water mark as it was proposed to make this tunnel. There were, in fact, none under 120ft. below low-water mark, and this one would reach 800ft. or 1000ft.

in parts. That led to a very great amount of doubt as to what money would be required for the tunnel, even if it could be made at all. He understood from his advisers that the pressure upon the soil through which the tunnel was made, even when it was 140ft., was so great as to make it

## EXTREMELY DIFFICULT TO BORE

the tunnel and to keep out the water; and at a depth of 800ft. or 1000ft. it might be practically impossible to do it at all. The proposal that the Government should spend public money in making communication between England and Ireland, if acceded to, would be an entirely new departure. It could not be supposed that those who had expended large sums of money in improving the existing communications would submit to have themselves taxed in order to provide a means of communication which would greatly damage, if not altogether destroy, the money which they had expended in making the communications which now existed. If the Government was to find money for this purpose it would be departing from a settled policy, and it would also raise up hostile opposition from more than one quarter. He was afraid, therefore, that he was unable to give them hopes of Government assistance so far as money was concerned. Mr. Wolff had said that all they wanted was £15,000, and that it might be taken out of the Agricultural Rates Bill. Well, if Mr. Wolff could persuade the representatives of Ireland to take it out of Irish resources the Government would not oppose it. The Government would, however, be prepared to enter into a conference with those interested in the scheme and give them the assistance of the Engineering Department of the Board of Trade.

## DEPTFORD'S NEW TECHNICAL SCHOOL.

A LIMITED competition for technical schools at Deptford has just been decided by Mr. Rowland Plumbé, the assessor. The designs have been on view at Church Street, Deptford, during Friday and Saturday last. A central hall and the usual accommodation for buildings of this class was asked for, and great importance was attached to an ample access of light. Cost was limited to £8000. Prizes were offered of fifty and twenty-five guineas. The first has been won by "Stanhope," and the second by "Kent." The designs submitted were not of a very high standard, but we think, on the whole, that the best was selected. This design by "Stanhope" was conveniently arranged for the working of the school, and due attention was paid to the requirement of light and air. We should think, as far as we could judge, that it would be built for the sum mentioned. It is not perhaps well arranged in the site, it presents a side elevation to the principal street, the New Cross Road. With the idea of making this side look more important and symmetrical, two gables have been introduced, one in the centre and one at the left-hand end, to balance the right-hand one, which have no object nor meaning whatever; they express nothing on the plan, they mean nothing, they are just a waste of money, and a sheer absurdity. Some large carved panels at the first floor level in all three gables, do not, in our opinion, improve the appearance of the building. We do not think that these small limited competitions, where presumably the authorities ask their personal friends to compete, quite regardless of their ability or reputation, are the best way to obtain good results. We think that a better way, where a limited competition is desired, is to advertise the fact, stating the terms and conditions proposed, and invite applications. These could then be submitted to the assessor they intend to employ, who would assist them in choosing the best men from the applicants. In several of these competitions that have been awarded during the last few years, we expect that they would have had better designs submitted if the competition had been open.

## Bricks and Mortar.

SPRINGHAM HOUSE, ARUNDEL STREET,  
July 28th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walls, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE restorer will shortly be at work at Twickenham, the Parish Church of that old-world Thames-side village having been surveyed and reported on at the instance of a Restoration Committee. A correspondent says that the restoration includes the re-facing of the tower and the alteration of the interior to a very great extent. So far, however, as the body of the Church is concerned, no one may be greatly moved whatever happens to it, for it is one of those hideous red brick Georgian structures which all along the Thames valley replaced the Gothic Architecture of more artistic times. But the tower is an ancient four-square and weather-worn, battlemented building, and to replace it would be to destroy its charm and the old-world air of the lovely reach upon which it looks down. It may be hoped that better counsels will prevail, and that the tower being structurally sound, will be left untouched.

SAN FRANCISCO has decided on the monument which it is to erect to the memory of Robert Louis Stevenson. It is to be a granite plinth supporting a ship to be called the *Bonaventure*. This will be 5ft. high, and will represent a warship of the sixteenth century in full sail. Her figure-head is to be a Pallas Athene looking straight into the West towards the distant land whither Stevenson himself, when he left San Francisco and the hosts of friends he had made, journeyed in search of health. On the front of the plinth will be the inscription: "To Robert Louis Stevenson," while beneath it will be a quotation from the "Christmas Sermon": "To earn a little, to spend a little less, to be honest, to be kind, to keep a few friends, and these without capitulation." The monument will take the practical form of a drinking fountain for dogs.

A FURTHER improvement is in course of progress at the Ludgate Circus end of Fleet Street. It has been decided to widen the pavement commencing at a point on the south side of the street, opposite Messrs. Cook and Son's offices down to the entrance to Bride Lane. The traffic at this end of Fleet Street is frequently so congested that the police have great difficulty in regulating it. The contemplated improvement will add about five yards to the roadway, while, owing to the frontages of several of the houses having been thrown back, ample accommodation has been left on the sidewalk for foot passengers.

AREWOOD HOUSE, the seat of the Lascelles family, where the Duke of Cambridge was the guest of the Earl of Harewood during his visit to Yorkshire last week, is an immense and stately mansion in the Grecian style, with an imposing portico, which was built in 1760, and altered about fifty years ago, by Sir Charles Barry. The interior is well arranged, and the principal rooms are very fine, with splendid painted ceilings. The house contains some valuable pictures, principally portraits, and a collection of old china (in the gallery), which is valued at £100,000. There is a lovely

view from the terrace, and the gardens and grounds are very beautiful, while the vineries are the finest in Yorkshire. The park, which is of vast extent, is richly wooded and very picturesque. Harewood House is built on the site of Gawthorpe Hall, the ancient seat of the Gascoignes, where the famous Chief Justice was born. The Church, which stands in the park, contains some interesting old monuments, most of them in English alabaster. One of the best is in memory of Sir William Gascoigne and his wife; he in coif and robes. Harewood is half-way between Harrogate and Leeds.

WE certainly think there is a good deal to be said for the suggestion of a correspondent that the Academy should be opened at night for the next week or two previous to the closing of the Exhibition for the season. Some years ago the experiment was tried. Sixpence admission was charged during the evening, and we never heard that the venture was not a complete success. It is certain that in these dog days many might go in the cool of the evening who elect to remain away during the heat of the day—not to mention that many hard-working people with a love for Art are compelled to devote their days to bread-winning.

THE accommodation at the Royal Architectural Museum and Westminster School of Art in Tufton Street, Dean's Yard, is about to be increased by the addition of some much-needed class-rooms. Some premises adjacent to the Museum have been removed, and the work is expected to be finished by Christmas. These additional premises will, it is hoped, relieve the Museum from some encroachments necessitated by the growth of the School, and also conduce to the extended success of the School, which from small beginnings has been gradually developed under Professor Fred Brown (now of the Slade School) and Mr. Monat Loudan, until it has become known far and wide, attracting students even from distant colonies. It enjoys substantial grants from the Technical Education Board of the L.C.C., and from the Science and Art Department.

ONE result of the re-arrangement of the British School pictures in the National Gallery, since the weeding out of the canvases which now fill two of the rooms of the Tate Gallery, has been to group all the masterpieces of our native Artists in that part of the Trafalgar Square building which is most exposed to danger from fire. The collection of pictures by Turner, Reynolds, Gainsborough, Hogarth, and other painters of the same rank, which there represents the earlier British School with something like adequacy, is now assembled in the western wing, and is only separated by an inefficient party wall from the canteen of the barrack building, which stands as a constant menace to the National Gallery. In the very possible event of this barrack being destroyed by fire, nothing could save this western wing from very serious damage; and as it is dominated not only by the barrack, but also by a row of shops, it seems to be exposed to a more than reasonable amount of risk. Yet this is the place selected for the permanent home of a priceless collection, which is supposed to summarise the achievement of a great school. Such an arrangement is not even commercially discreet.

ALTHOUGH there is matter for very sincere regret in the announcement that Professor Herkomer has been compelled by considerations of health to abandon his scheme for the re-creation of a great national Art movement in Wales, we can hardly feel surprised that such a task should have proved to be beyond the power of a man whose energies are already very fully engaged in a multiplicity of exacting undertakings. An Artist as successful as he is in the practice of his profession must necessarily find his spare time seriously limited and his opportunities for rest few and far between. To sacrifice these opportunities by adding to his life yet another responsibility, and that one great enough to afford the sole

occupation for a lifetime, would almost certainly lead to a breakdown. The influence which the Professor has already established in Art politics is proving to be so valuable that it would be a real disaster if, by attempting to draw unreasonably upon his physical powers, he should so affect his health that a diminution of his activity should become necessary. He is wise to recognise that there are limits even to his extraordinary capacity for work; and that he can more usefully serve the cause of Art by completing what he has at present in hand than by seeking for new and vaster fields of conquest.

SIR EDWARD POYNTER's new edition of his *Lectures on Art* (Chapman and Hall) comprises, besides an excellent frontispiece portrait, a new preface which is especially interesting for its emphatic recognition of the change that has taken place in the whole tendency of Art in England since 1869, when the first of these discourses was written for University College, before the lecturer's appointment as Slade Professor. In his first edition, published some ten years later, he acknowledged that much that he had said on this subject had even then become obsolete. He now declares that looking back to the period when the lecture referred to was delivered, he finds it difficult to believe that a condition of Art existed in England to which some of his remarks at that time justly applied. The remark has, of course, special reference to Decorative Art, which is the subject of the first lecture. The lecturer, however, appears to have discovered that his enthusiastic description of the grandeur of Michael Angelo's great work in the Sistine Chapel was "in those days not for all markets." In a "reminiscence" given in a footnote he tells us that he delivered this lecture at some provincial centres, and that on one of these occasions he somewhat anxiously inquired of the subordinate official of the institution, whose duty it was to be present, "How did it go? I am afraid it was rather long." "Ah," was the reply, with an accent and an uncompromising directness which left no doubt as to the speaker's nationality, "ye'd better have left out all that about McLangelo; we know nothing about McLangelo here."

WITHIN the last few days archaeologists and others have been much interested in certain Roman remains which have been brought to light in the ancient city of Chester, and to some of which we referred last week. During the process of excavations incidental to the rebuilding of a shop in Northgate (or Shoemaker's) Row, near the centre of the city, the workmen came upon the base of a large Roman column *in situ*. The fact that this relic occupies the exact spot in which it was placed by Roman workmen sixteen centuries ago, adds largely to the interest which the discovery has excited. It is of native red sandstone and rests upon the natural rock, some 2ft. below the level of the present street, and almost in a line with the west side of Northgate Street, which some archaeologists have contended follows the line of one of the ancient Roman *vies*. The block is 4ft. 6in. square, with a base moulding 15in. thick worked upon it, and is in a good state of preservation. The diameter of the column is shown to have been 2ft. 10½in., or three Roman feet, of 11½ English inches to the foot. A day or two after the base was discovered a column, if not the identical column belonging to this base, certainly one of the series, was partially unearthed. It is lying in a horizontal position a few feet from the base, with a modern party wall built across it. A few Roman coins, also in a good state of preservation, have been found upon the site. Speculation is, of course, rife as to what the building was of which these interesting relics formed part. The columns which stood upon this and similar bases must have been equal to eight, if not nine, diameters, or 24ft. or 27ft. in height, and there must have been at least two, but more probably four—or even six, of them if, as appears likely, they formed the front of a Roman Basilica or Temple, and the building generally must have been of very

imposing proportions. At present it is impossible to say whether these columns formed the east or west front of such an edifice, but that question, the answer to which involves other interesting points, will duly engage the attention of those best able to judge, and in the meantime further discoveries may help them to come to a conclusion. The owner of the property, Alderman Charles Brown, has already decided that this very interesting evidence of the importance of the ancient Roman city of Chester shall remain *in situ*.

THE work connected with the Battenberg Memorial Chapel at St. Mildred's, the parish Church of Whippingham, in the Isle of Wight, is nearly completed. A beautiful effect has been produced by the arrangement of carved and polished marble. The new sarcophagus, fixed some few feet from the marble altar-table at the east end, to allow space for worshippers, is of chaste design and richly carved. It has taken the place of the plain tomb which has been standing in the chapel since the funeral of Prince Henry. The base is composed of dove marble, and small triple columns of marble, from the Marquis of Lorne's estate in Scotland, are arranged at the sides and angles. The panels, of pure white statuary marble, bear the orders and the arms of Prince and Princess Henry, carved in perfect detail. The massive cover of the sarcophagus is elaborated with appropriate scriptural texts, and the Latin motto "In te Domine spero." The altar-table, constructed of dove and statuary marble, is approached by polished marble steps. Above the table is to be erected the figure of an angel with outstretched wings, which will stand about 8ft. high, and occupy the major portion of the east end. H.R.H. the Princess Louise (Marchioness of Lorne) is now engaged upon this work, which will give a noble as well as graceful finish to that portion of the chapel. The floor is of polished stone with a border into which are introduced, in monogram, the initials B.B. In the north wall are three new stained glass windows, representing St. Henry, St. Elizabeth, and St. Mauritz. Mr. Gilbert, R.A., has the bronze screen and gate in hand.

PERHAPS the most notable sale of Jacobite relics and curios ever held was that at Culoden House, when part of the contents of that historic mansion were put up to auction. Situate within a short distance of the ill-fated field of Culoden, the house has had closest association with Prince Charles, and for years past the relics have formed a chief attraction to visitors to the Highlands. They are in an excellent state of preservation, and their genuineness cannot be doubted. The many relics and curios sold included the bedstead on which Prince Charles slept and his walking stick, made of hazel, and having a carved head representing Wisdom and Folly, which was left by the Prince in the house. It was at first thought that Parliament would step in and secure the relics, which ought to be the property of the nation; but this has not been done. At the sale any articles having Jacobite associations fetched high figures. A magnificent grandfather's eight-day clock by Sterek realised £52, and an antique eight-day wall clock £50. Three Oriental plates used for religious purposes, enamelled in azure blue and having emblematic signs, were sold at £160.

THE presentation of the Congratulatory Address to Her Majesty the Queen, by the Society of Architects, took place on Wednesday last, at St. James' Palace. Her Majesty having consented that the Address should be presented personally, deputed H.R.H. the Prince of Wales to receive the same, at the hands of the President and a small deputation, on her behalf. The Lord Chamberlain notified to the Society Her Majesty's desire that six members should attend at St. James' Palace as a deputation for the above purpose. The deputation consisted of the President, Mr. Robert Walker, J.P., of Cork, Mr. Walter Emden, Mr. Henry Lovegrove, Major F. S. Leslie, Mr. Edgar Farman, and the Honorary Secretary, Mr. Ellis Marsland. The deputation was introduced to H.R.H. by Mr. Edgar

Farman, who presented personally to H.R.H. the President, Mr. Robert Walker, and Mr. Ellis Marsland. H.R.H., after having shaken hands with the President, handed him Her Majesty's gracious reply to the Address of the Society as follows:—"On behalf of the Queen, my dear mother, I thank you for your loyal and dutiful address, and for the affectionate congratulations which you tender on the completion of the sixtieth year of her reign. It is a source of profound joy to the Queen to receive the expressions of devotion to her person and family which are offered by her subjects throughout the Empire. She is gladdened by the thought that the sixty years of her reign have been years of progress in knowledge and of increase in prosperity. And she prays that, by the blessing of Almighty God, she may always live in the hearts of her loving and beloved people." The Society is to be congratulated upon the distinction and honour conferred upon it by Her Majesty the Queen in thus receiving personally, at the hands of the heir to the Throne, the expression of loyalty and congratulation contained in the address. The address was a beautifully designed illuminated document, specially prepared under the direct superintendence of Major Leslie, to whom the Council is much indebted. Accompanying the address was a list of members, specially bound in book form in vellum and gold, containing, as a frontispiece, a portrait of the president, Mr. Robert Walker.

DR. HILPRECHT, who has recently been excavating in Babylonia, and on the shores of the Persian Gulf, has just published a very interesting work on the results of his researches. The work, which is entitled "Recent Research in Bible Lands," gives a fair idea of what may be expected by a systematic excavation of Babylonia and the Tiro-Euphrates valley. Dr. Hilprecht has discovered many valuable and interesting relics, which are very vividly described in his book. Many of these antiquities are so old that even the British Museum does not contain many specimens of that remote antiquity, for some are as old as 4500 B.C.

THE Marchioness of Lorne is already known to the public as a painter and sculptor. Her Royal Highness has now turned her attention to Architecture. With the assistance of a London Architect, the Marchioness has planned the designs for an extension of the quiet little hostelry at Roseneath, a delightful retreat situated on the Gareloch, one of the arms of the Clyde, and about an hour and a half's journey from Glasgow. For some years past the Marchioness and the Marquis of Lorne have made the little hotel their recruiting quarters at the close of the London season, but the accommodation was rather restricted, and as the inn—for such it is—is situated on the Argyll ducal estate, an enlargement was considered, and from the design of the Marchioness a new wing has now been almost completed. It is all that comfort could desire. The additional wing consists of a suite of seven bedrooms, dining and drawing-rooms, a gun-room, &c. The drawing-room windows look out upon the blue waters of the Firth and the lofty Ben Lomond. Alcovod fireplaces, windows arched in mediæval fashion, and a kitchen bright with red tiles, are some of the features adopted by the Royal Architect. The Marchioness is to paint the device on the hanging sign over the public entrance to the hotel.

SIR WILLIAM HARCOURT's earliest recollection of Millbank, as "the philosophic expression of the reformatory prison," would have afforded even greater testimony to the progress of society and of the individual during the Victorian era, if he had gone further in illustration of this gratifying fact. As is well known, the huge building in Clerkenwell, the famous Coldbath Fields Prison, has long since been taken over by the Post Office, whilst upon the site of an even older building still, the Tothill Fields Prison, at the back of Victoria Street, Westminster, is now being erected, mainly through the munificence of

the Duke of Norfolk, the magnificent Cathedral, the foundation-stone of which was laid about two years ago. By a curious coincidence, another stately Cathedral, which his Grace has built at Norwich, stands on the site of the old city prison which was erected in the year 1822.

THE work of repairing the stone frame to receive the Duke of Westminster's gift of stained glass for the great window in the south transept of St. Paul's Cathedral proceeds but slowly. The glass has long been finished, and it was thought the window would have been ready for it so long ago as last Christmas. The Duke has promised the glass for the corresponding window in the north transept also. Nothing further has been heard of Lady Carnarvon's proffered gift of stained glass for the east window in the north choir aisle, in memory of her husband.

CAPTAIN BRINKLEY, probably the first living authority upon Chinese and Japanese porcelain and faience, has decided to disperse his collection of the choicest examples of the Art. Messrs. Christie, Manson, and Woods sold the first portion of it at their rooms in King Street, St. James's Square, last week. It is described as "Old Chinese whole-colour, enamelled and blue and white Nankin porcelain, Japanese porcelain, and faience," and the first portion consisted of 208 lots. No such collection has ever before come as a whole to the hammer in this country.

THERE are at present on exhibition a number of drawings from the tombs and temples of El Kab at the rooms of the Society of Antiquaries. These represent the work of Mr. J. J. Tylor and Mr. Somers Clarke, who have been exploring in Egypt for some years past. El Kab is situated on the east bank of the Nile, about fifty miles south of Luxor; it was known to the Greeks as Ellethya, but its Egyptian name was Nekheb. The remains cover a space of about nine square miles, and include old temples and rock cut tombs, of which there are vast numbers. The great object of these explorations has been to procure correct copies of the inscriptions and the groups of figures represented on the walls. To make certain of accuracy, photography has been employed, but wherever the light has failed in producing distinctness, a charcoal pencil has been artistically used, and the result obtained has much the appearance of the real wall, but, at the same time, with a perfect exactness which the photographic basis ensures.

THE Select Committee on the appropriation of sites for Government offices has practically agreed upon the draft report submitted by Mr. Akers-Douglas, as chairman. It confirms the interim report of last year in favour of the site of Carrington House, in Whitehall, opposite the Horse Guards, for the new War Office; it supports the proposed widening of Parliament Street to a line parallel with the front of the Home Office; and recommends an opening from the Mall to Charing Cross.

MESSRS. FOX AND BOUSFIELD sold by auction at the Mart, Tokenhouse-yard, the Church of St. Michael, Wood Street, City, by order of the Ecclesiastical Commissioners. The Church was built by Sir Christopher Wren, but for some time past it had been closed. The monuments and tablets have been taken to the neighbouring Church of St. Albans, and the human remains removed to Woking. Some of the tombs date as far back as the time of Elizabeth. The estate comprises an area of 3700 superficial feet. The Church and freehold were eventually knocked down for £31,500.

THE Public Health and Housing Committee of the London County Council has now under consideration final estimates for the greater part of the remaining Boundary scheme. These amount to about £70,000, and it is hoped that they will all be passed before the Council rises for the autumn recess, so that work, which is now somewhat at a standstill, may be vigorously resumed. The dwellings and shops

and workshops that have been set up have practically all let with the greatest readiness.

We understand that the First Commissioner of Works has no intention whatever of removing the three historical canvases which

of the Fine Arts Commission, for the decoration of the panels of the Houses of Parliament. For a long time they hung in the members' old smoking-room, but two years ago they were discovered rolled up and hidden away among a quantity of lumber. Mr. Watts' huge

No such sensation is among the pictures from the Paris Salons this season as was afforded last year by Mons. Tattégren's "Les Bouches Inutiles." Nevertheless, the managers at 157, New Bond Street, have made a diversified collection, which does not exclude the

Elevation

Section

LINCOLN CATHEDRAL. DETAILS OF SOUTH PORCH TO RETRO CHOIR. MEASURED AND DRAWN BY W. E. DOBSON.

for some time past have been hanging on the walls of Committee Room 10, where they have been generally admired, from the precincts of the House of Commons, as was rumoured not long since. The pictures in question, which are by Watts, Pickersgill, and Cross, were executed nearly fifty years ago, at the request

painting, representing Alfred inciting the Britons to resist the landing of the Danes, is far too large for the present smoking-room, so that all three will remain in their present position until a place can be found in the House where their artistic merits can be displayed to advantage.

typical Parisian horrors in realism or the curious mixture of symbolism with modernity. Of the latter class the most elaborated is "Gold Triumphant and its Victims," by Mons. Henri Cain—Gold personified by a top-hatted, bejewelled Hebrew, speaking of shekels in every inch of him, seated on a car headed by

a peacock with spread gorgeous plumage, a shimmer of gold and gems, and drawn by and over those whom he has crushed by or for gold. "The Interrupted Duel," a huge picture, containing some dozen life-sized figures, by Mons. Garnelo-Alda, is unemotional, but is well drawn, and, at least, is not as brutal as another version of "The Woman Who Did," furnished by Piatkowski. Two of the best pictures are scarcely more than monochromes, namely, the dreary hopelessness of landscape and long string of prisoners bound for Siberia, by Mr. Julius Price; and a furrowed field with a stream of black turkeys in the grey of the evening, by Hy. Eugene Delacroix. Uncanny, fascinating, and in its way powerful is the "Glauké and Thaléia," of Mons. P. A. Laurens, a gallery picture, rather than one to live with, but speaking volubly of its author's creative imagination. Mr. A. Normann's Norwegian landscapes, a sober and characterful "Lady in Black," by Mons. J. G. Sabatte, and two airy luminous little pictures, "Evening Sun" and "In the Village," by Mdle. E. Von Eicken, also claim attention.

THE Australian sculptor, Mr. Bertram Mackennal, has just completed a bronze bust of Mrs. Phil May. Although Mr. Mackennal has been in England for some time now, he is not forgotten by the Australians, and a commission has just reached him to execute a very large design for a sarcophagus, which will take many months to complete. Madame Melba, who is herself an Australian, has arranged to give Mr. Mackennal sittings for portrait busts, one being destined for Melbourne when finished, and the other to be retained by the Diva.

At last the City Sewers Commission is realizing the danger and inconvenience of cellar flaps in main thoroughfares. At one time an application was granted almost as a matter of course without a word being said, but now a reasonable hesitancy is exhibited, and flaps are only sanctioned when it is clearly shown that they will cause little or no inconvenience.

THE annual meeting of subscribers to the British School at Athens was held last week at 22, Albemarle Street, with Sir Edward Poynter in the chair. The report of the managing committee showed that in spite of the recent war the school had had a very satisfactory session. The number of students had been considerably above the average, and good work had been done at home and in the field. The students' hostel was now an accomplished fact. In the winter and spring the excavations begun last season on the supposed site of the gymnasium of Kynosarges in Athens were carried to completion. The cost of this undertaking had been met by funds placed at the disposal of the director by private friends. After various difficulties and delays, work was resumed in Melos on the site of Phylakopi early in May, and carried on energetically for four or five weeks. There was now no doubt that the remains of an important prehistoric city had been discovered, the complete excavation of which, in a subsequent session, might lead to results of first-rate interest. It might be doubted whether during the past session any other foreign school in Athens had got through so much work. The main difficulty was still on the financial side. So long as the School had no permanent endowment it could not enjoy entire freedom of action. For three years, at any rate, it could hold its own, thanks to the Government grant of £500, which was obtained through the liberality of Sir William Harcourt. But it should not be forgotten that the outlook beyond that period was uncertain, and that there was still an opening for any generous benefactor who might place the institution beyond any fear of financial anxiety.—The Chairman, in commending the work of the school, remarked that excavations were the life of archaeology. He thought that such energy as had been displayed in spite of the recent war should be liberally supported by the public.—The Director of the School gave an interesting account of the work of the session. Several discoveries of importance to

archæological students had been made, and photographs of vases and statuettes in various states of preservation were passed round the room and scanned with interest.—The report was adopted, and the officers for the ensuing year were elected.—Mr. George Macmillan, who has acted as honorary secretary of the school since it was opened in 1886, retires from that post in favour of Mr. William Loring.

IN presenting the annual report, the Council of the Liverpool Architectural Society expresses its satisfaction at the large attendances which have been present at every meeting, attendances greatly in advance of those of previous years. It regrets, however, that the discussions after the papers have been, in most cases, so meagre, and that they have been left in the hands of a few of the members. It begs to remind the members that they will show their appreciation of the papers read better by a thorough discussion, even though they disagree with the lecturer on some points, than by a mere formal vote of thanks. The Council regrets the retirement of Mr. H. L. Beckwith from the Honorary Secretaryship, a post which he held to the advantage of the society for seven years. The Council has decided that next session, in addition to the eight ordinary meetings, four extra members' meetings will be held. The Council hopes to be able to establish an Annual Travelling Studentship, to be awarded at the end of each Session. Next session being the Jubilee year of the Society, it is hoped to celebrate it in a fitting manner. The Treasurer submitted his annual balance sheet, showing a balance in hand of £26. The number of members on the roll is 121 as against 137 last year.

IN October it is expected that the South London Art Gallery and Technical Institute will be opened. The institution began as an Art Gallery only. Last year it was determined to erect in connection with the Fine Art Gallery a new building as an Art School and Technical Institute. This has now been done, Mr. Passmore Edwards giving £5000 for the purpose. The new Technical Institute stands in front of the old gallery, which will have now a far more imposing and convenient entrance than it formerly had. The new building faces the main Peckham Road, nearly opposite the Central Library.

THE railway bridge constructed by the military engineers over the Adour at Tarbes, in the place of the one which was carried away by the recent floods, has broken down under the weight of two locomotives, which fell into the river. In order to test the structure, an empty train was run on to the bridge and allowed to stand there for half an hour. The amount of yield observed was then about normal. A severer test was afterwards arranged, a train being made up of two engines and several trucks heavily laden with sleepers. Just as the first engine was on the point of reaching the further side, the bridge swayed for a moment and then gave way, both engines and all the trucks attached being hurled into the Adour, where they are still lying in a heap. The collapse of the bridge was due to the bad material used in its construction, and to bad workmanship. The design was efficient, and would have answered had the material been up to specification.

MR. J. C. HORSLEY, R.A., has been compelled through failing health to resign the position of treasurer to the Royal Academy, which he has held for many years. The retiring treasurer's views on Art and Art teaching have not always agreed with those of the younger members of his profession, but he is an excellent man of business, and in this capacity has done good service to the Academy. It may not be generally known that Mr. Horsley has during recent years been chiefly responsible for the collection and arrangement of the pictures in the winter exhibitions of the Old Masters. There will probably be several candidates for the vacant treasurer-ship, for the duties are not heavy, and a comfortable salary is attached to the office. The treasurer is moreover a person in

authority at Burlington House. He is entitled to attend all the Council meetings, and to be present at the judging of the pictures by the Selecting Committee. The treasurer also has a free entry to the galleries while the arrangement of the pictures for the spring Exhibition is in progress, a privilege which is strictly denied to any ordinary Academician, unless, of course, he happens to be upon the Hanging Committee.

The Americans seem to be even more behind the age than the English in the majority of the designs which their silversmiths issue for the benefit of their patrons. The latest is certainly more appropriate than artistic. It consists of a testimonial to the president of the American Exchange National Bank, and is an exact counterpart in miniature of the Bank of England. The fac-simile is correct even to the names of the streets on the corners of the buildings and the lamp-posts on the side-walks. It took twelve months to manufacture.

IT is proposed that application should be made to the Ecclesiastical Commissioners for the appointment of a Commission to inquire into the desirability of amalgamating the parish of St. Mary, Aldermanbury, with the united benefice of St. Lawrence, Jewry, and St. Michael, Bassishaw. It is a fine Church externally—one of Wren's—the old building having been destroyed by the Great Fire. The interior has, however, been greatly modernised, with a not altogether satisfactory result. The original structure dated back to a very remote period, and amongst the memorable interments were those of Henry Condell and John Heminge, the "editors" of the first collected edition of Shakespeare's dramatic works.

THE annual meeting of the general committee of the Palestine Exploration Fund was held at 24, Hanover Square. In the report which was read attention was drawn to important results of the excavations at Jerusalem by Dr. Bliss, and the meeting was afterwards addressed by Dr. Bliss himself, who is on a visit to this country. The limits of the Pool of Siloam have been determined, and portions of the rock-hewn steps which led down to it have been found. The Church which was known to have existed at Siloam has been discovered, and its plan, which presents many features of interest, has been ascertained. The paved street which has been followed a long distance up the Tyropœon Valley is apparently that by which the pilgrim Antoninus (570 A.D.) descended from the "Double Gate" or "Triple Gate" of the Haram to Siloam.

AT Victoria Tower-chambers, Westminster, the Bishop of Rochester presided at the second general meeting of the members of the Clergy and Artists' Association. The Chairman said that although the association had started little more than a year ago, it had already gained the confidence of the public. The object it had in view was to enable the clergy to approach the Artist more directly than was now usual or possible, and to obtain from him his best work for the decoration of churches. They sought also to form a centre where examples of artistic work executed for churches could be seen, and where information could be gained. The Church of England's interests were widespread, and anything that could contribute to better relations between the Church and the people must be welcomed. The living representation of religious subjects by true Artists must inevitably produce useful and far reaching results.—It was stated that many Artists not members of the association had received commissions for decorative church work through the agency.

THE Lords of the Admiralty have lent to the United Service Museum at Whitehall a most interesting collection of relics from the King's palace at Benin, which were presented to them by Rear-Admiral Sir Harry Rawson, K.C.B. These include some curiously-carved ivory tusks weighing as much as two hundred-weight each, and some very primitive and quaintly-fashioned groups of bronze figures, one

of which represents the execution scene. Captain Charles Campbell, R.N., C.B., has also lent a small bronze statuette, evidently of Spanish origin, and the collection also includes some remarkable cast-iron devices, representing the king surrounded by his attendants, and two or three large bowls richly ornamented with gold.

THE County Council is considering a recommendation from the Parks Committee that it should acquire as a public recreation ground about nineteen acres three roods of land lying

nimity. The City Council has rendered itself ridiculous, Messrs Hare and Bodley have been placed in a very unfair position, and the citizens of Oxford will have to pay. And, after all, the only difference between the three Architects is that one does a little less patching-up to the old building, and is probably only deterred from doing more by the warning before his eyes of the fate which has befallen his brother Architects.

THE last Exhibitions in Paris of the students'

work abroad, as seen each year on the 10th of December, would usually hardly do credit to an amateur's sketch-book. America, we notice, has followed the European fashion, and sends her students over here; but as she only gives them 600 dollars yearly, and compels them to work in each city under the supervision of an American Artist, they probably benefit even less than those in whose footsteps they tread.

PUBLIC-HOUSE Architecture and decoration is becoming a special feature in the City. It

TOMB IN ST. MARY'S CHURCH, WELWICK, YORKS. MEASURED AND DRAWN BY W. HAYWOOD.

between Putney Bridge Road and the Thames. It is proposed that the Council should contribute £15,500 and the Wandsworth District Board £10,000 towards the cost. This would leave about £5500 to be provided by public subscriptions.

THE Carfax Tower farce has terminated with the acceptance of Mr. Jackson's proposal, and that Architect is probably the only person who can survey the result with equa-

works who gained the Prix de Rome is described as remarkable only for its "infatigable médiocrité"—a mediocrity which has been increasing of late years to such an extent that the question is being asked, "What is the good of this elaborate machinery, this Palace at Rome, and this State subvention, if the result is only to turn out a set of working designers?" The same might probably also be said of the travelling scholarships of our own Royal Academy, for the outcome of the students'

is recognised that the old style tavern is no longer commensurate with the requirements of the present generation, and, as a consequence, many improvements and structural alterations have been, and are being, effected by owners and proprietors. Those who remember the old "Whittington" in Moor Lane, Fore Street, will hardly recognise the new and modern building which has now sprung up in its place. The present erection stands also on the site of an adjoining shop, purchased for the extension.

## Professional Items.

**AYR.**—At the Dean of Guild Court on the 21st inst., the following plans were approved of and passed: John Armour, double cottage in Campbell Street; Robert Carson, dwelling-house in Hawkhill; Mitchell and Son, store in Garden Street; Robert McCreath, two semi-detached cottages in Ashgrove Street; W. A. Vass, tenement in Fort Street.

**BRADFORD.**—The new higher Board school erected by the Bradford Board in Byron Street and Barkerend Road, is to supersede premises rented in the same neighbourhood which have been objected to for some considerable time by the Education Department. The cost of the building, exclusive of the site, but inclusive of special science and art fittings and other furnishing, will be a little over £15,000. The school is a specimen of simple treatment in the English Renaissance style, which has now generally taken the place of Gothic for school purposes, and lends itself excellently to ample lighting. The principal front is to Byron Street, and shows on the basement a series of ten large arches, which, with the exception of four glazed arches in the centre, lighting a laboratory, give access to a covered playground. Corresponding to these arches on the floor above is a series of windows, 10ft. by 6ft. 6in., with arched heads, and the two floors above are lighted by a similar number of two-light windows with mullions and transoms. At the Barkerend Road extremity of the school are bold moulded entrances, and a large bay window, belonging to a cookery room, is a conspicuous feature. The schools are restricted to two departments, one for girls and one for boys. The staircases in the school are constructed with an especial view to the prevention of accident from haste or panic. Coming to the contents of the different stories the basement comprises covered playgrounds, teachers' rooms, cloak-rooms, and a physical laboratory. On the ground floor the accommodation includes a large assembly hall, about 70ft. long and 29ft. wide, four class-rooms to hold sixty scholars each, a large cookery class-room, and teachers' rooms. The rooms on the first floor include an assembly hall of the same dimensions as that beneath, and five class-rooms. The top floor consists of science and art rooms. Over the assembly halls is a large chemical laboratory (about 70ft. by 22ft. 6in.), fitted up with four working benches to accommodate fifty-six students. At one end of the floor is a science lecture-hall. In an angle of the building, between the laboratory and the lecture-hall, is a preparation-room adjoining and serving both, and a balance-room and store-room also belong to this suite. The heating and ventilation of the school are on the Leicester plenum system, which provides for the renewal of the air by a powerful fan driven by a gas engine. The plans have been prepared by Mr. C. H. Hargreaves, Architect, Bradford, and the allotment of the principal contracts was as follows:—Messrs. John Moulson and Sons, masons and joiners' work; Messrs. Taylor and Parsons, structural iron-work, ranges, and grates; Mr. J. Wood, plumbers' work; Mr. James Smith, slaters' work; Mr. W. H. Hargreaves, plasterers' work; Mr. J. Arundel, painters' work; Messrs. Ashwell and Nesbit, of Leicester and London, ventilating and heating apparatus; and Messrs. Illingworth, Ingham and Co., laboratory fittings and science and art furniture. The new school stands on a plot of land about 11,100 square yards in area, but the premises only take up about half that space.

**CAMBUSLANG.**—A new Church is being erected for the Free congregation on a site at the corner of Main Street and Rosebank Street. The plans, which are by Mr. A. Lindsay Miller, Glasgow, provide for the re-erection of the Church on the old site, with new halls, &c., to the rear, the whole scheme costing over £4500. Immediately to the west of this the United Presbyterian congregation has secured a suitable site at Rossbank House, opposite the West Established Church,

Main Street, for a new Church and halls to be erected at a cost of something like £4000, and for which plans have been prepared by Mr. William Ferguson, Glasgow, and the work of building will be begun shortly.

**CHATHAM.**—The Queen has signified her approval of the proposal to give the new tower now being erected at St. Mary's Church the name of the Victoria Tower. The Hon. Mrs. Talbot, wife of the Lord Bishop of Rochester, laid the foundation stone of the new tower, which is to be furnished with a peal of eight bells and a clock, on the 21st inst. Archdeacon Cheesham, in his address, stated that the Church had stood on the site almost since the date of the Norman invasion.

**EDINBURGH.**—The Public Health Committee of the Edinburgh Town Council last week again considered the estimates for the erection of the general offices, staff quarters, and scarlet fever pavilion of the New City Hospital at Colinton Mains. It was resolved to recommend acceptance of separate estimates for each branch of the work, amounting to about £89,000. At last meeting of Council the estimate of Mr. Colin Macandrew, amounting to over £93,000, was recommended for acceptance for carrying out the whole of the work, but the matter was re-committed owing to some alleged irregularity in the opening of the estimates.

**HALIFAX.**—At a recent meeting of the Town Council the Watch Committee recommended that of the competitive plans sent in for the erection of a new court-house, police station, &c., on the site of the old Infirmary, the first premium of £50 be awarded to the set marked "Diamond Jubilee," of which the estimated cost was £12,599, and the second prize of £25 to those marked "V.R."—The Chairman of the Committee said he did not agree with his committee on the subject. He maintained, as he had done from the first, that the adaptation scheme was the best, and could be carried out at a saving of fully £6000. With these observations he moved the adoption of the minutes.—Alderman Spencer moved to refer back the minute with regard to the plans bearing the motto "Diamond Jubilee." He maintained that the adaptation plans submitted by the Borough Engineer, which were estimated to cost only £9000, were by far the best.—Eventually the amendment was put and carried, and the whole question was again sent back to the committee.—The names of the authors of the two plans were then read out by Alderman Hodgson, the "Diamond Jubilee" plans being sent in by Messrs. James and Sweet Escott, Architects, Cardiff, and the plans marked "V.R." by Messrs. Leming and Leming, of London.

**HARROGATE.**—The Duke of Cambridge formally opened on Friday last the Royal Baths at Harrogate, a notable pile of buildings, which must contribute in no small degree to the prosperity of the town as a health resort. Internally the equipment is in keeping with the style of Architecture. The baths, of which the foundation stone was laid on July 10th, 1894, comprise six departments. First, there is the central hall or pump room, then the gentlemen's baths, ladies' baths, the general rooms, and the Winter Garden. These are all on the ground floor. In connection with the Winter Garden are ladies' and gentlemen's cloak rooms. The latter is a lofty apartment, paved with marble mosaic, and fitted with walnut joinery. At the east end is an ornamental stone staircase leading to an aisled vestibule on the level of Parliament-street. The central hall is entered from the main doorway at the north end, over which are the arms of the town. This is a very fine apartment, lighted by large clerestory windows of delicately stained glass. Both the central hall and the vestibule are tiled with light-coloured Roman mosaic. The hall opens into the four bathing departments. The gentlemen's baths are approached by a vaulted corridor. There is a handsomely decorated waiting-room and eight dressing-rooms. These open into the slipper baths, which are all tiled in white.

The gentlemen's dressing-hall is a vaulted apartment, 96ft. long, fitted with twenty-four walnut-wood cubicles and six dressing-rooms, floored with parquet, and having a small fountain of Burmantofts ware in the middle. The ladies' department is similar to the gentlemen's, except in matters of detail and decoration. The Turkish Bath is very completely fitted. The whole of the building is lighted by electricity, and heated by low-pressure steam-pipes. The principal contracts have been carried out as follows: Masonry, brickwork, carpentry, and joinery, Mr. Isaac Gould, of Leeds; ironwork and plumbing, Messrs. H. Braithwaite and Co., of Leeds; plastering, Messrs. S. Johnson and Sons, of Mirfield; slating, Mr. Joseph Shepherd, of Harrogate; painting and decorating, Messrs. J. Pollard and Son, of Leeds. Messrs. Baggallay and Bristowe, of London, are the Architects.

**HOLLOWAY, N.**—The Great Hall of the Northern Polytechnic Institute in the Holloway Road was formally opened a few days ago. The educational buildings at present erected consist of two blocks—one with a fine frontage on the Holloway Road, and the other roughly parallel with it some 200ft. away. These two blocks are connected by a corridor, on the north side of which is the great hall; while on the south side is a plot of ground, covering nearly twice the area of the hall, on which are afterwards to be erected the remaining buildings of the Institute. Each of the main blocks consists of three floors. In front the ground floor is taken up by the entrance hall, the principal's room, and the secretary's offices. Above are the drawing office, the engineering department, and the physical lecture theatre and laboratory. The second block contains the brickwork shop, the smithy, the carpenters' shop, and the mechanical and chemical laboratories. On the ground floor beside the hall are the gymnasium, and a large room to be fitted up as a common room. The great hall is a lofty and finely-proportioned building approached from the Holloway Road by means of a handsome vestibule. It measures some 100ft. by 55ft., will seat over 1200 persons, and is fitted with a large orchestral platform. The roof is elliptical shaped, and is covered with fibrous plaster divided into panels with ornamental centres, every alternate panel containing an electric light. When lighted up the effect is very good, and the general illumination excellent. In the daytime the hall is lighted by circular-headed windows, supported by stone columns, each bay containing three windows, enclosed in a setting of moulded bricks, whilst the floor is of solid cubes, and has a gradual slope from the entrance to the front of the platform. The gallery has a separate entrance from the Holloway Road, and an emergency exit to the rear. In the front there are three spacious doorways, with three on the north side as exits, leading into a corridor connecting the body of the hall with the orchestra platform. Beneath the platform is a large retiring room, with other rooms for artistes, speakers, &c., whilst suitable lavatories are also provided close by. The heating is by steam, conveyed in pipes along channels each side of the hall. The ventilation has been the subject of careful consideration, and is so arranged that fresh air enters the steam-heated channels from the outside, passes warmed into the building, and is drawn away through the ceiling openings to exhaust ventilators on the roof of the hall, whilst an additional supply of fresh air is also obtained by opening the full width of the side windows, forming a sill made of iron. The Architect was Mr. Charles Bell, 3, Salters' Hall Court, Cannon Street, and the work has been carried out by Messrs. Macfarlane Brothers, of Holloway. Messrs. Clarke and Sons, of Moorgate-street, supplies the heating plant, and Messrs. Kite and Co. the ventilating arrangements, and the plaster ceiling was made by Mr. Tanner, Holloway.

**KELVINBRIDGE.**—An important improvement in the station facilities of the Central Railway has just been added at Kelvinbridge. Since the opening of the railway, the only entrance to this station has been from the Great

Western Road at the west end of the bridge. A bridge has now been constructed leading from the Woodlands Road bridge right up to the platform of the Kelvinbridge Station. The booking office and entrance are at the West-End Park Gate.

**LIVERPOOL.**—The plasterers' dispute in Liverpool still remains unsettled, and the largest building operations are delayed, notably the Post Office, School Board Offices, University Buildings, Fire Police Offices, Cook Street, White Star Offices, Toxteth Infirmary, Teachers' Training College, &c., owing to the attitude assumed by the men. On the 1st of May the men put forward their demands for an increase of wages and alteration of rules. Meetings were held and the matters discussed, with the result that the employers agreed to the advance of wages at the rate of one half-penny per hour, but could not agree to the alteration of rules as suggested by the men, the bulk of the changes being so drastic and one-sided. However, in order to avoid, if possible, a stoppage of work at the busiest part of the season, and also to prove their *bona fides*, the employers suggested arbitration, but this the men would not agree to, and went out on strike. Singularly enough, one of the rules proposed by the men, and to which the masters agree, is that referring to a board of conciliation, the men having hitherto persistently declined arbitration. One rule which the men wish to abolish is a very old one, and is agreed to by all the other trades, viz., "Each employer shall conduct his business in any way he may think advantageous in all details of management not infringing on the individual liberty of the workmen or these rules." Another rule which the men seek to enforce, and to which the masters most strenuously object, is "That the society delegate be allowed to go on the jobs to speak to the foreman during working hours." The employers naturally contend that this would prove an intolerable interference with their business, and would lead to incessant friction. Then on the apprentice question the men and the masters are at loggerheads. The former desire to limit the number of apprentices, while the latter urge that the supply of plasterers is at present insufficient for the demand, and if the apprentice system is curtailed the supply will be still further diminished. There are many more technical points of a minor character in the rules, but those quoted are sufficient to show the necessity for arbitration. If the men have faith in the justice of their demands they should welcome the offer of the employers and accept arbitration, and thus put an end to a dispute which has already gone too far, and involved both sides in serious losses.

**MORECAMBE.**—The new Victoria Pavilion in connection with the Morecambe Winter Gardens, opened a few days ago, has been erected by Messrs. S. Whitehead and Sons, of Oldham, from the designs of Messrs. Magnall and Littlewood, Architects, of Manchester, and the façade, which is of terra-cotta from Ruabon, is provided with two large balconies, from which a fine view is obtained of the scenery across the bay. The Pavilion, standing back as it does at a distance from the roadway, has a most striking appearance. For a place of entertainment the span of the roof is said to be the largest in the world, measuring no less than 118ft. from wall to wall, whilst from the floor of the auditorium the roof is 65ft. high. The ceiling is covered with a very fine fibrous plastic work in the Italian Renaissance style, from the designs of Mr. Bardell (Messrs. A. R. Dean and Co., Birmingham). The stage is very large, being 72ft. wide, 35ft. deep, and 60ft. to the grid floor. The entire building is illuminated by electric light, generated by the Winter Gardens Company's own plant, the wiring and the lamps being supplied by the Keighley Electric Lighting Company.

**TAMERTON.**—A fund has been opened for the restoration of the Parish Church of Tamerton Foliot. The nave and south aisle of the Church were re-built in 1850. In the blizzard of 1891 two large elm trees fell on the north

aisle. A new aisle was built, and many internal improvements carried out under the direction of Mr. G. H. Fellowes Prynne, and the church was re-opened in September, 1895, by the late Bishop Knight Bruce.

**WINDHILL.**—A new Infants' School, erected at Woodend, Windhill, by the Shipley School Board, and opened a few days ago, has been designed on the Central Hall principle, and affords accommodation for 260 children. Messrs. Kendall and Baker, of Leeds, were the Architects, and the contractors who have carried out the various works are as follow:—Executors of the late Mr. Fred. Ives, Shipley, masonry and joinery; Messrs. B. and T. Thornton, Shipley, slating; Mr. A. Higginbotham, Idle, plumbing, glazing, and heating apparatus; Mr. E. Walker, Idle, painting; Mr. O. Lister, Ilkley, concreting and wood-block floor laying; Mr. T. Keighley, Idle, plastering; Messrs. Walker & Co., Idle, wrought-iron railing, &c.; and Messrs. A. W. Kershaw and Co., Lancaster, ventilation.

**YARMOUTH.**—Another permanent addition to the attractions of Great Yarmouth was made last week, by the opening of a revolving observation tower erected on the north beach near the Royal Aquarium. The structure is 125ft. in height, and is built entirely of steel on concrete foundations. Including the machinery it weighs about 125 tons. A circular platform built round the tower, and constructed to accommodate about 160 passengers, is raised to the summit and lowered by means of steam power. As it ascends, the platform revolves by electric power at the rate of one revolution in three minutes. There is another platform at the summit, to which access is obtained from the revolving apparatus, and which is hoisted to an additional height of about 20ft. From this elevation a magnificent view is obtained. At night the structure is illuminated by 50 incandescent electric lights and by three arc lights. At the base of the tower are spacious bars and dining rooms.

ANOTHER statue of Joan of Arc is to grace Paris. The beautiful piece of sculpture by M. Paul Dubois, exhibited in the Salon of 1895, will occupy the centre of the Place des Petits Pères, opposite the Church of Notre Dame des Victoires.

We learn that the Carpenters' Company has appointed Mr. H. Phillips Fletcher, F.S.L., A.R.I.B.A., as surveyor, in the place of Professor T. Roger Smith, who had held the appointment for many years, and who has now joined the Court of the Company.

THE Corporation of Newport invites tenders for the erection of additional buildings in connection with the municipal electricity works of the borough. Mr. Robert Hammond, Ormond House, Great Trinity Lane, is the consulting electrical engineer to the Corporation.

An endeavour is being made to raise a sum of money to place a bust of Mr. Tate in the gallery which has hitherto passed by his name. As his connection with it will probably be obliterated as soon as possible by the Government, there is certainly a reason for the endeavour.

Two French civil engineers and three hydrological experts of the same nationality have just arrived in Russia in order to study on the spot the question of constructing a canal between the Volga and the Don. The expense of the undertaking is approximately estimated at 65,000,000 roubles.

THE Harrow, Uxbridge, and High Wycombe Railway Bill was recently under the consideration of the Select Committee of the House of Lords. The Bill, which originally contemplated the provision of a railway from Harrow to High Wycombe by way of Uxbridge, was, by the decision of the Commons Committee, confined to the promotion of a line between Harrow and Uxbridge. This railway, six and a half miles in length, proceeds from a junction of the authorised railway between Ealing and Harrow, by way of Ruislip and Ickenham, to a terminus at Uxbridge. The estimate of the cost is about £180,000.

## SOCIETY MEETINGS.

**Edinburgh Architectural Association.** During the winter session of the Association Mr. Thomas Gibson, of Eglinton Crescent, put at the disposal of the Council a sum of £30, to be given in prizes for the best design for a fireproof dwelling, taking as the basis of the design a house similar to those in the west end of Edinburgh. The Council appointed Mr. W. W. Robertson, of Her Majesty's Board of Works; Mr. Westland, C.E.; and the then president of the Association, Dr. Rowland Anderson, to examine and decide on the relative merits of the designs submitted. In response to the invitation of the Council, five sets of designs were submitted. After their examination, the design submitted by Mr. James Cairns was placed first; that by Messrs. J. Gordon Smart and Louis Blanc, second; and the one by Mr. Alexander Arnot, third—£15, £10, and £5 being awarded to them. The first and second successful competitors are assistant and pupils in the office of Mr. Hippolyte J. Blanc, and the third prizeman is of the office of Messrs. J. D. Peddie and Washington Browne.

**Yorkshire Archaeological Society.**—The second excursion organised by this Society took place on the 22nd inst., the members proceeding to Steeton Hall, which, according to a pedigree of Reygate, in Foster's Yorkshire Pedigrees, was held by the Reygates from the time of Henry III. down to 1375, when John de Reygate, the last male representative of the family, died. The numerous shields were carefully examined, and the vaulted room and other fragments of mediæval work were a source of interest to the visitors. Ledsham Church, which was given to Pontefract Priory by Robert de Lacy, was next visited, and Monkfryston, so called because the Benedictine Monks of Selby were the owners of the place, proved to archaeologists worthy of consideration. Passing on to Birkin, the Church of that place was surrounded with many items fascinating to strangers, the principal feature being that it is one of the most perfect examples of a small Norman Church to be found in Yorkshire. With the exception of the addition of an aisle, it was found that it had been very little altered. Brayton was the last place visited, and there the Church was gone through. The earliest part of the present structure is of about the same date as the Norman work of the Church at Birkin, and represents a Church built under the same influence, but on a larger scale. The tomb of George, Lord d'Arcy (1558) and the arms thereon were matters which proved exceptionally interesting.—Mr. William Brown, the secretary, gave historical notes on each Church visited, and Mr. J. Bilston, F.S.A., submitted the architectural descriptions.

**National Association of Master Builders of Great Britain.**—The annual summer meeting of the National Association of Master Builders of Great Britain was held at Bristol on Tuesday week, under the presidency of Mr. T. F. Rider, of London. The president said that out of sixty-seven demands made upon them this year sixty were with regard to increase of wages. He wished he could go further and say that the increase of wages resulted in an increase in the quantity of work done in the time; but he feared the experience of all of them was what, unhappily, was the experience of their forefathers—namely, that an increase of wages as a rule meant a decrease in work. There was, he thought, no greater fallacy than the one so often enunciated by trade unions—that if they decreased the number of hours a man worked they increased the production which was the result of that man's work. With regard to the Workmen's Compensation Bill, he thought that if a workman proceeded under either the new Bill or the Employers' Liability Bill he should be barred from proceeding under the other. They already had two pistols levelled at their head, and here seemed to be a chance of a third. But the great objection to the Bill so far as the building trade was concerned, lay in the fact that the building trade was not included as a whole or left out altogether. The report,

the adoption of which he moved, referred to the arrogant behaviour of the trade unions, recent instances of which he mentioned in regard to the operative bricklayers and plasterers. The time was rapidly approaching when the building trade would have to fight those unions and decide whether capital was to rule labour or labour rule capital. The report having been adopted, a resolution was carried agreeing with the action of Lord Wemyss in moving the rejection of the Workmen's Compensation Bill in the House of Lords, as the meeting believed the Bill would be found to act injuriously on the conduct of many large industries, and especially on the building trade.

**The Sanitary Institute.**—The Sanitary Institute has just issued particulars of the Health Exhibition to be held in the Camp Road Building, Leeds, from Tuesday, September 14th, until Saturday, October 9th. The Exhibition is held in connection with the Sixteenth Autumn Congress of the Institute, and includes sanitary apparatus and appliances, and articles for domestic use and economy. The principal boroughs throughout the Kingdom will send delegates to the meeting, and nearly six hundred representatives will be present, in addition to the members and ordinary visitors. As the progress of sanitary science has been largely associated with the Victorian Era, it is thought to be a fitting opportunity to illustrate, by means of contrast and otherwise, the greatest advance made during that period. The committee will be glad (as far as practicable) to grant facilities to exhibitors who may be able to show apparatus or appliances illustrating such contrasts. Applications for space should be made to Mr. W. H. Knight, the curator of the Exhibition, and addressed to the offices of the Institute, Margaret Street, London, W. A full and detailed report of the Exhibition will duly appear in the BUILDERS' JOURNAL.

**Society of Engineers.**—An interesting visit was made by a party of the members of the Society of Engineers on Tuesday, the 20th instant, to the ironworks of Messrs. Easton, Anderson and Goolden, Limited, at Erith. The Erith Ironworks were commenced in 1864 by the firm of Easton, Amos and Anderson, and were laid out by Sir William Anderson, then a member of the firm, and now Director-General of Ordnance Factories. Designed at first as an off-shoot from the principal works at the Grove, Southwark, gradual extensions were carried out from time to time, until in 1873 the Grove Works were finally closed, and the machinery and tools moved down to Erith. The works stand on a plot of ground about 17 acres in extent, and having a frontage of about 800ft. to the River Thames, and the various shops are arranged side by side, the general direction being perpendicular to the river bank, so as to allow of the shop travellers working out on a gantry over barges lying in the river. A railway siding extends from the South Eastern Railway into the works, so that easy communication both by water and rail is ensured. The various shops lie between the offices and the river. Commencing from the west side there are covered stores for stock, 95ft. by 43ft., and sheds for patterns covering an area of 150ft. by 90ft. Next to these lies a pattern shop 100ft. by 50ft. with a packing store at one end, and an electrical shop in two bays with a store close by. The dimensions of the electrical shop are 150ft. by 100ft., and room is left at the river end for extensions. East of these shops is a large open yard, and again east of this is the main building, consisting of six equal spans of 43ft. by 600ft. The two western spans are occupied by an iron foundry 240ft. long, a brass foundry and smiths' shop. The next two spans are given up to machine and erecting shops, the roof in the latter being carried up so as to allow for the erection of lofty engines, the high traveller rails being 39ft. above floor level. The two bays next to these are devoted to boiler and bridge building; beyond this is another extensive yard, in which is a gantry used for the erection of caisson and other large work not easily dealt with in the shops. Beyond this is a field which is utilised as a ground for testing gun carriages, and is pro-

vided with suitable butts, &c. One of the principal businesses in which the Company is engaged is pumping machinery of all sorts. Formerly it used to make large numbers of beam engines for this purpose. Of late years it has been developing the direct-acting inverted triple expansion type, a notable installation being at the new Waterworks at Leicester, where three such engines of large size are to be found. The Company has just brought out a new Corliss gear, which is very simple and efficient. It has also introduced a new high-speed engine (called the "Erith" engine), chiefly for direct driving of dynamos, which promises to have a good future before it.

## Correspondence.

MR. JUSTICE CAVE AND ARCHITECTS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In a recent report of the case of Jalland v. Tyler and Hind, it appeared that no less than ten Architects were called upon to give evidence. The learned judge, in summing up, is reported to have said that "there are no such unsatisfactory men as Architects," and that all other scientific men tried to come to some sort of an agreement! Lawyers, and also doctors, disagree, and prosper more or less under the process, and there have been numerous cases where even learned judges have differed from each other, and reversed and re-reversed decisions. If two or three judges cannot agree, it appears less likely that ten Architects should do so.—Yours faithfully,

GEORGE H. BIBBY.

Hampstead, N.W., July 24, 1897.

## Announcements.

### Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to pay postage.

All matter must reach the Editor by the first post on Monday morning to ensure its treatment in the current issue.

### Publishing.

The terms for free post Subscription to any part of the United Kingdom are SIX SHILLINGS AND SIX PENCE per annum by half-yearly or annual prepayments.

### Advertising.

SITUATIONS WANTED, SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS.

Per line, Sixpence. Minimum charge, eighteenpence.

Three Insertions for the price of Two.

Prepayments in the above advertisements is absolutely necessary.

Page or Paragraph Announcements, Trade Advertisements, Auction Sales and Contracts Open.

Prices on application.

Small Advertisements for current week's issue are received up to first post Monday morning inclusive.

### Editorial and Publishing Offices:

Effingham House, Arundel St  
Strand, W.C.

As a memorial of the sixtieth year of the reign of the Queen, it is proposed to build an English Church in Lucerne, and an appeal for funds with this object in view is now being made. The cost of the site and the Church will be £7000.

A REMARKABLE collection of portraits of the Royal family formed by Miss Marianne Skerrett, a lady filling a post of confidence in the Queen's service for over twenty-five years from the date of her marriage, was disposed of at Messrs. Sotheby's auction rooms last week. The most important and interesting works in the collection were three drawings by the Queen herself, and also four etchings by Her Majesty (signed), including a portrait of Prince Albert. The collection realised £60.

## Trade and Craft.

### MANUFACTURE OF MOTOR CARS.

The motor carriage industry has taken root far more readily in France and in other Continental countries than it has done in England. There are upwards of forty firms manufacturing self-propelled vehicles in France, and the new industry is in a much more prosperous state across the Channel than it is here. The French have a decided preference for mechanical road traction, for they are not so squeamish about considerations of vibration, smell, and other minor drawbacks so long as they find auto-cars more economical than horsed vehicles, and, while most of the existing tramways are being equipped with cars propelled by steam, electricity, or compressed air, it is stipulated that on all new lines that are laid down mechanical power must be used. The result on the tramways has been that the service is not only vastly improved and made quicker and more regular, but it works out at a considerably reduced cost, so that many a line formerly working at a loss is now making large profits. The experiences of the experimenters with oil-driven motor carriages have apparently not been very encouraging, and all the manufacturing firms are more sanguine about the future than satisfied with the present. In regard to steam, the chief progress recorded seems to have been made by the Scotte road train, which in the transport of passengers has been put to very severe tests in various parts of France, and has come through the ordeal very satisfactorily. It is an omnibus train consisting usually of the motor carriage with a large omnibus attached to it, and the experimental service of these steam vehicles between Courbevoie and Colombes, in the environs of Paris, has during the month or two for which the road trains have been at work given every satisfaction.

### NEW RAILWAY IN THE ISLE OF WIGHT.

The ceremony of opening a new railway in the Isle of Wight took place recently. The line at present is five and a half miles long. It begins at a junction on the Newport and Sandown system called Merston, and proceeds by an upward gradient through Godshill and the picturesque village of Whitwell, at each of which places there is a station, to St. Lawrence, a village to the west of Ventnor. At the summit of the line, near Whitwell Station, the train enters a tunnel 620 yards long, which pierces the Down. It is intended to extend the line through the Steephill Estate and to connect it with Ventnor by a station within a short distance of the Royal Hotel and on a level with the centre of the town. Messrs. C. J. Westwood and Co., of Clement's Lane, London, are the contractors. It is claimed for the new line that it enables the tourist to reach the Undercliff from the centre of the Isle of Wight by a shortened journey of six miles, which is accomplished in about twenty minutes.

A NEW road and railway swing bridge over the Nene, erected by the Midland and Great Northern joint railways, was opened for traffic last week, at Sutton, Lincolnshire. The bridge, which has been three years in construction, cost £80,000, and replaces the structure built by Robert Stephenson forty-six years ago. The new bridge is worked by hydraulic power.

WITH regard to the London County Council's notice, posted on Charing Cross railway bridge, announcing that the structure was in a dangerous state, the South-Eastern Railway Company states that the structure is not in a dangerous condition. The lining of the bridge, it is explained, is slightly out of repair, but could and would be put right in a very short time.

THE tenth annual Exhibition of pictures in connection with the Yorkshire Union of Artists was recently opened in the West Cliff Saloon, Whitby. There are about 270 pictures hung, and about 280 have been rejected on account of the somewhat limited amount of space available. The work exhibited shows a distinct advance upon previous displays.

MESSRS. G. WALLER AND CO., 165, Queen Victoria Street, have obtained the contract for the execution of all sewer ironwork for the vestry of St. George-the-Martyr during the ensuing three years.

A new fire station in Carmelite Street, Whitefriars, was opened last week. The new station, which consists of five stories, is second only in size to the headquarters in Southwark, and has been constructed at a cost of more than £20,000. The building was designed by Mr. Thomas Blashill, Architect to the Council.

The Kaiser Wilhelm railway bridge, between Solingen and Rhemseheid in Rhenish Prussia, the largest structure of the kind on the Continent, has been formally opened by Prince Frederick Leopold of Prussia, representing the Emperor. The total length of the bridge is 511yds., and that of its central span 187yds. It crosses the river Wupper at a height of 353ft. above the water level, and is thus the highest bridge in the world.

### TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

**ANNFIELD PLAIN (Durham).**—For the execution of road improvement works, for the Urban District Council. Mr. T. J. Trowsdale, Surveyor, Annfield Plain:—  
 Jos. Goldborough £38 1 6 Gates and Gold-  
 Thos. A. Turnbull 304 19 0 borough, West  
 Joseph Dunn 289 11 0 Kyo (accepted) £259 0 4

## WORKHOUSE PLANNING.

(Continued from page xciv.)

By GEORGE H. BIBBY, F.R.I.B.A.

### IX.—CONCLUSION.

ALTHOUGH parochial law provided to some extent for the support and care of the poor, yet it was not until the year 1730 that workhouses or poorhouses became general. The kind of building that was then erected must have, usually, been poor in the extreme; for instance, a workhouse was erected in the year 1733 at Birmingham at a cost of £1173 3s 5d. for the accommodation of 600 paupers! This sum will be estimated as extraordinarily small in these times, yet an old writer names the building as one "which the stranger would rather suppose was the residence of a gentleman than of six hundred paupers. We cannot pass through this splendid edifice without being pleased with its internal economy; order influences the whole, nor can the cleanliness be exceeded; but I am exceedingly concerned that I cannot pass through without complaint. We cannot with indifference behold infants crowded into a room by the hundred, commanded perhaps by some disbanded soldier, termed a schoolmaster, who, having changed the sword for the rod, continues much inclined to draw blood with his arms; where every individual not only re-breathes his own air, but that of another. The whole assembly is composed of the feeble, the afflicted, the maimed, and the orphan, the result of whose confinement is a sallow aspect and a sickly frame."

In planning sleeping rooms it should be noted that the bedsteads for ordinary inmates must be about 2ft. 6in. wide, and fully 6ft. long, and made of iron, and a space for a chair must be allowed for between each bed; the bedsteads for the sick should be 6ft. by 2ft. 9in., and for the bedridden, the lying-in cases, and women with children, the width should be from 3ft. to 4ft.

It is important, for the purpose of giving notice of an outbreak of fire, that every distinct part of the building, whether detached or not, should have proper means of communication, either directly or indirectly, with the chief officials' quarters, and for this purpose telegraphic or telephonic communication should be provided; all buildings occupied by the workhouse inmates should also possess some convenient fire-extinguishing apparatus, such as fire-buckets, chemical fire-engines or extinguishers; in large buildings, and where the supply of water is sufficient, a system of main pipes and hydrants may with advantage be provided and arranged with fixtures, so that nozzles may be fixed forthwith upon an alarm of fire. These should be placed on or near to a staircase, and on each floor level.

Fire-escapes and ladders, and canvas shoots, &c., should not be very much relied

upon as means of exit in the event of an emergency. If the dormitories, &c., are properly planned with two means of exit at each end leading to two staircases, such additional precautions need seldom be provided.

In certain rural districts the workhouse is occasionally to be found in some remote hamlet or village, far from a town, from whence supplies may be drawn. Such a workhouse exists at Stanford Rivers, about three miles from the small town of Ongar, in Essex, and is the most isolated building of the kind with which I am acquainted. Such buildings should of course be provided with special appliances in the event of fire or panic, as it would be impossible to rely much, or at all, upon assistance from a Fire Brigade Station situate in a distant town; and the provision of an adequate supply of water in such cases is a subject that requires the most careful and serious attention.

Precautions against fire, and the provision of appliances to deal with fire, should one break out, are amongst the most important duties which the Architects and others concerned with workhouses are called upon to carry out. The outbreak of a serious fire in a building occupied largely by sick, infirm, or imbecile paupers, is an event to be provided against with the greatest care, and the neglect of proper and reasonable precautions has frequently led to horrible scenes and loss of life. The duties, therefore, of workhouse managers with reference to the possibility of the occurrence of fire include: *First*, the precautions to be adopted to prevent an outbreak of fire; *second*, the means that have to be provided to secure the safety of the inmates in case a fire should occur; and, *third*, the means that have to be provided to extinguish fire. The public authorities who have given the greatest attention to such matters as the above are the London County Council and the late Metropolitan Board of Works, and the care and skill with which these have dealt with theatres and music halls has rendered such buildings (as regards panic and fire questions) to be models for study by those interested in the erection of workhouses, hospitals, and all other public buildings.

The London County Council has also set an example, for imitation by other authorities, as to the precautions to be insisted upon in the construction of factories and workshops throughout the country in reference to fire or panic. This is a subject of even greater importance than the safety of theatres, &c., inasmuch as the latter are occupied for only two or three hours, while factories and workshops are sometimes filled with people working for ten or twelve hours daily in the midst of goods likely easily to take fire, explode, or otherwise cause injury. During the past four or five years the factories and workshops of London have been under survey and inspection by experts from the Architects' department of the London County Council, and numerous improvements have been made, in all parts of the metropolis, to the means of escape from many factories

and workshops. There is (said a leading official of the Council) no more important work in the hands of the London County Council than that which is carried into effect by the factory inspectors and surveyors, all of whom have had an Architectural training, and whose duties are likely to be enormously increased as the surveys continue to advance.

Workhouses, hospitals, asylums, and many other descriptions of buildings (in the provinces especially) require similar attention, and this can only be effectually given by Architects who have devoted great care and consideration to the subject, and whose professional remuneration should be in accordance with the great importance and responsibility of the duties performed. Unfortunately, some public bodies remunerate their clerks and other officials (who have no technical knowledge) at a higher rate than their Architect officials, although the latter may have had a costly education and may be highly qualified for the duties they perform. It should be the duty of the members of the Royal Institute of British Architects, and especially the Council, to endeavour to influence for all Architects a fair remuneration for their labours, whether these are in public offices or private practice. The common and paltry excuse for giving a fully competent Architect's assistant a salary of three guineas per week is: "There are plenty of men who would be glad to come for less." The public hear that assistants are to be cheaply had, and naturally consider that the Architect in practice may also be "bated down."

In the larger towns and great cities plans for workhouses and extensions thereto are occasionally obtained after limited or open competitions; but in many districts a local surveyor, with or without the assistance of a specialist, is entrusted to prepare the plans and specifications.

The Local Government Board require that the plans, sections (longitudinal and transverse), and elevations for new workhouse buildings, or for alterations to existing buildings, are to be drawn to a scale of one-eighth of an inch to one foot, unless, from the extent of the intended buildings, the use of this scale would render the size of the plans inconveniently large. They should show, in addition to the usual details, the proposed number and position of the beds in the several wards, and should be accompanied with a general plan, drawn to a scale of one-sixteenth of an inch to a foot of the entire premises (exclusive of the intended agricultural land), showing the site of the proposed works, the course of the drains and their outfall, and the position of any intended sewage and water-tanks. Figured dimensions should be given, the points of the compass should be clearly indicated, and the specification of works, and also a description of the general system of heating and ventilation, should accompany the plans.

It is also required that all plans of new buildings should be submitted in sketch outlines before detailed plans and drawings

are prepared, so that all defects of construction and arrangement may be duly considered and detected before any expense in the preparation of complete plans has been incurred.

In Architecture there is a tendency (as in other professions) for the practitioner, as he advances in years, to become conscious that he has become antiquated in his methods of work, and that the plans he produces are in many respects too suggestive of those he has prepared in previous years. Then it is that he looks round for a young and able man as his assistant and partner in order that he may avail himself of the most recent knowledge procurable, and those modes of procedure which are more easily secured by the young than by those whose earlier training may have prejudiced their attempts to keep up with the times. This is certainly the course that should frequently be adopted with regard to workhouses and asylums, but more especially the former. The regulations of the Local Government Board and of the Commissioners in Lunacy, although containing so much that is valuable and suggestive, are yet framed in such a manner as to restrict Architects from great attempts to be original in their schemes, but of course, superior as the younger Architect may be in recent methods, yet he has usually more to learn from the experience of his senior than the latter has from him.

So far as my own observation has informed me, there are large numbers of Architects in many parts of the country who from time to time endeavour to obtain specialist Architectural assistance upon the subject of the best modes of planning workhouses, asylums, hospitals, and buildings of a kindred nature; some of these are Architects of the highest position, others are persons who appear to rely entirely upon the work of others in the preparation of their plans, specifications, and reports; drawing a full commission from their clients, but paying as little as possible to their assistants. If the latter should complain, they may be reminded that "there are plenty of others to be found willing to do the work for less."

Many of these workhouse and asylum commissions are for buildings of great magnitude, the Architect's remuneration amounting in some instances to £10,000 or £15,000, or even more. The present scale of professional practice and charges of Architects, sanctioned by the Royal Institute of British Architects, was confirmed so far back as at a general conference of Architects of the United Kingdom held in the year 1872, but it is in some respects very indefinite, and requires revision and improvement, for Architects and their assistants are generally (and as a result of the present system of Architectural education) far more highly qualified than was the case twenty-five years ago, when the existing scale of charges came into force. If Architects are just to themselves, to each other, and to those who assist them, the public will have good reason to be more liberal in their views about Architectural matters than hitherto, and fewer members of the Profession may, as a result, find their last home in the workhouse.

THE END.

RECENTLY Mr. R. H. Bicknell, C.E., Local Government Board inspector, held an inquiry at the White Lion Inn, Chasetown, with respect to an application by the Lichfield Rural District Council for sanction to a loan of £2600 for works of sewerage and sewage disposal. It was stated that the assessable value of Chasetown was £19,131, there being no outstanding loans. The estimated population was 2000. A system of drainage was carried out fifteen or sixteen years ago by the Rural Sanitary Authority, but as the sewage emptied into an open ditch complaints had arisen, and in an action tried at the Birmingham Assizes in December, 1895, Mr. R. H. Ashmall, farmer, Hammerwich, obtained £200 damages for loss of lambs owing to a water-course passing through his land having been poisoned with sewage matter. The necessity for a proper scheme of sewerage had consequently been brought to the front. There was no opposition.

#### NEW POSITION OF THE L.C.C. WORKS DEPARTMENT.

THE General Purposes Committee of the London County Council brought up a report at last week's meeting of the Council, indicating re-arrangements necessitated by the decision recently come to in reference to the Works Department. It recommends, firstly, that the resolution of last March reappointing the Works Committee, be rescinded; and, secondly, that a number of new standing orders be adopted. The paragraphs that define the condition of things that will prevail under the new system are as follow:

(1.) All works ordered by the Council to be carried out without the intervention of a contractor shall, unless in any case otherwise ordered, in future be carried out by the manager of the Works Department, who shall be responsible to the Executive Committee in the same way as a contractor would be. The Finance Committee shall have control of the finances of the Department.

Any Committee contemplating the execution of any work shall, before coming to a decision as to how the work shall be carried out, obtain an estimate from the proper officer. When the estimate is received, if the Committee should then decide to recommend the Council to have the work carried out without the intervention of a contractor, it shall, before reporting to the Council, refer such estimate, together with full plans and specifications, to the manager of the Works Department for his examination and report.

(2.) The manager shall, subject to supervision by the Establishment Committee as regards officials appointed by the Council, have the control of the staff exclusively employed in connection with the works of construction, repair, and maintenance undertaken by the Works Department.

(3.) The manager shall, unless in any case otherwise ordered, carry out jobbing works and repairs, including the work of the erection of hoardings, fans, and shoring.

(4.) All works referred to the manager to carry out, for which bills of quantities and, where necessary, complete specifications and drawings are not supplied, shall be considered as jobbing works.

No Committee, however, shall order a work to be carried out as a jobbing work unless it is satisfied that there is sufficient reason for not treating the work in question as an estimated work, and, except as regards dangerous structure work and works undertaken on emergency, in every instance the Committee shall have laid before it by the engineer, architect, or other certifying officer, as the case may be, a rough estimate of the cost.

A schedule of prices agreed upon between the manager of the Works Department and the architect and engineer, upon which in respect of jobbing works the estimates, measurements, and certificates of the architect, engineer, or other certifying officer shall be based, shall be revised periodically.

(5.) The officer under whose supervision the work has been carried out by the manager of the Works Department, shall certify, as in the case of the contractor, as to the satisfactory completion of the work and the amount of his financial estimate, or the value on the schedule of prices, as the case may be.

The functions of the manager are thus defined:

"The head of the Works Department is to be styled 'manager of works,' and is to be responsible, unless in any case it is otherwise ordered, for the execution of all works executed on behalf of the Council without the intervention of a contractor; he is also to be responsible under the Finance Committee for advising as to the purchase of plant and material, the employment and supervision of all officers and workmen in his department or employed on works, and the care, regulation, and direction of all workshops and depôts connected with the Works Department, including the Central works; and is also to be responsible to the Finance Committee for the custody, issue, and use of all plant, materials, and stores purchased in connection with works executed; and, in addition to the other con-

ditions on which he holds his appointment, he is to give his whole time to the duties of his office, and is not to take any private business; and any fees received by him either as a witness or in any other capacity, and any discount or allowance on materials purchased, are to be paid to the Council; and, further, on retirement he shall not be entitled and shall not make any claim to any retiring allowance under the Superannuations Act, 1866, and he shall be subject to the Council's regulations in respect of a superannuation and provident fund."

There are a number of rules dealing with the financial side of the subject, it being provided that the accounts of the cost of all operations of the Department shall be kept by a Works Accountant, who shall be responsible to the Finance Committee. Separate accounts are to be kept of the cost of each work. In the Finance Committee will be vested—

"The financial control of the Works Department, and the supervision of the purchase of materials, plant, horses, &c., required for works carried out by the Works Department, and of the accounts connected with such works, and the making of the necessary regulations with regard thereto."

Considerable interest will attach to the fate of a series of recommendations in the report of the Housing of the Working Classes Committee. These recommendations propose that, subject in each case to the Works Manager being satisfied with the architect's estimate, several extensive building operations, representing a total approximate value of £66,627, be carried out by the Department.

#### LONDON COUNTY COUNCIL.

##### REVIEW OF THE YEAR.

DR. COLLINS, in a review of the work of the London County Council for the year, given at last week's meeting, said that during the second year of the third Council, ending March 31st last, there were thirty-six meetings. The twenty-eight standing and four special committees held more than 1600 meetings during the year.

##### FINANCE.

The Money Act of 1896 enabled the Council to issue a new description of stock, which, unlike its present stocks, would not be compulsorily redeemable at any fixed date, though it would be redeemable at the Council's option on conditions fixed on its creation. The county rate, which for the financial year 1896-97 was 15d., was reduced during the current year to 14½d. The purchase of the North Metropolitan Tramways Company and the London Streets Tramway Company, involving an expenditure of nearly three-quarters of a million of money, was the largest financial transaction which the Council had carried through. In doing this the Council had acquired a remunerative undertaking, and would receive in rent more than £50,000 a year.

##### THAMES TUNNEL.

One of the chief events of the year had been the completion of the Blackwall Tunnel, and the experience gained had led the Bridges Committee to recommend and the Council to approve another tunnel beneath the Thames between Greenwich and Millwall, for pedestrian traffic only, at a cost of £70,500.

##### FIRES.

The statistics presented by the Fire Brigade Committee indicated that while the fires in London in 1896 numbered 3616, a total which had only been exceeded once in the last ten years, yet the percentage of the whole classed as "serious" was the lowest recorded during that period, namely, 3 per cent. Hydrants to the number of 23,253 had now been provided over eighty-three square miles of the county.

##### PARKS AND OPEN SPACES.

The Parks Committee now exercised the Council's control over seventy-nine open spaces, with an acreage of 3635, as against forty such spaces, with an acreage of 2656, inherited from their predecessors. The Council had during the past year assisted the

acquisition of recreation grounds in poor and crowded districts at Bermondsey, Walworth, Hoxton, and Islington. In the outlying and more favoured districts of Hampstead and Sydenham open spaces which were threatened had been preserved, in view of the approach of bricks and mortar, and no doubt wisely. Misapprehension of the Committee's intentions in regard to works on Hampstead Heath had, he trusted, been allayed. Not a ruthless vandalism, but an æsthetic solicitude, had prompted the Committee to plant for the future so as to preserve the picturesque of the present; while it had tended the gorse with a reverence worthy of Linnaeus. The Council's bands had given 767 performances in the parks during the season.

#### PUBLIC HEALTH.

The Public Health Committee, besides its administrative duties in regard to licensing offensive trades, slaughter-houses, &c., and the registration and regulation of common lodging-houses, exercised the Council's powers as the central health authority for the whole of London. A survey had been made of the sanitary condition of various districts, and representations addressed to the local authorities where the strength of the sanitary staff had appeared to be inadequate. The year 1896 was characterised by the lowest death-rate but one in London since registration of deaths began in the year of Her Majesty's accession. It amounted to 18.2 per 1000 living on a population of 4,421,955. For the decade 1885-94 the death-rate of London was lower than that of any of the capitals of Europe. This year the death-rate for the first half was only 16.5 per 1000.

#### THE WORKS DEPARTMENT.

Owing, doubtless, to recent events, they had not as yet received the report for 1896-7 of the Works Committee. As the Department had recently been the subject of inquiry by a special committee, and of considerable discussion in the Council, there was less need for detailed notice. Fictitious entries in the books of the Department were last autumn discovered by the comptroller in the ordinary course of his audit. The officers concerned were punished by immediate dismissal. Mr. Waterhouse stated that "these entries had no reference to any misappropriation of moneys, nor did they conceal any action whereby any employé of the Department was pecuniarily advantaged."

#### TECHNICAL EDUCATION.

The Technical Education Board last year spent £115,532, the bulk of which sum was devoted to grants to about 100 institutions giving approved technical instruction and subject to inspection by the Science and Art advisers of the Board. A central School of Arts and Crafts was opened last November in Regent Street. It was the first attempt made by the Board to supply technical instruction directly under its own management. Besides technical drawing and design, classes were there held in stained glass work, lead work, enamelling, bookbinding, colour printing, and heraldic drawing. A sum of £21,405 was last year absorbed by scholarships.

#### LOFTY IDEALS.

In conclusion, the Chairman said:—"The Council's work is so vast and varied, its influence has been felt so deeply, that it seems almost incredible that our body is but eight years old. In that time much has been accomplished and some progress has been made. Of course there have been failures, for the Council has the defects of its qualities. The long-delayed and overdue municipalisation of London generated an impetuosity which perhaps attempted more than could be immediately achieved, but the ideals aimed at have been lofty ones. These ideals were justly recognised and formulated in the gracious reply to the first address this Council has presented in person to the Sovereign on the throne in these words—"Ever to strive to further advance the welfare of the vast population of the metropolis, and do all that lies in our power to keep London worthy of its place as the capital of the Empire."

#### TRAMS ON THE EMBANKMENT.

An animated discussion took place on the recommendation of the Highways Committee for the Council to seek power in the next Parliament for the construction of a tramway from the existing termini of the London and South London Tramways Companies at Westminster Bridge Road, along the centre of Westminster Bridge and the whole of the Victoria Embankment to Blackfriars Bridge. —The Earl of Hardwicke moved that the report be referred back, but this was defeated, and the recommendation was carried.

## Surveying and Sanitary Notes.

THE Committee of the House of Commons has considered the proposals of the Corporation of Newport with the object of improving the water supply of the town and district. The preamble of the bill was proved, subject to certain conditions. The Committee thinks it would be a graceful act if the Corporation were to give to the district council a small sum to help it in covering over the swallow-holes. Mr. Freeman, on behalf of the Corporation, said the Corporation was quite prepared to assist the rural district authority by giving the sum of £300, to be employed in filling up the swallow-holes.

MR. RIENZI WALTON, on behalf of the Local Government Board, recently attended at the Urban Council offices, Bognor, for the purpose of inquiring into the applications of the West-hampnett Rural District Council to borrow £4000, and the Urban Council of Bognor to borrow £500 in connection with the scheme of sewerage proposed to be carried out in the parish of South Bersted. The details of the scheme have frequently been discussed at meetings of the two bodies concerned. There was practically no opposition to the scheme, a report upon which will in due course be made by the Inspector to the Local Government Board.

THE Chairman of the Shoeburyness Urban District Council recently witnessed, with a number of friends, the opening of a new sewerage scheme and waterworks at Shoeburyness. The various works were explained by Mr. G. R. Strachan, partner with Mr. Mansergh, the engineer. Mr. Frederic Gregson, the clerk of the Council, said Shoeburyness was very much to be congratulated upon the scheme. Nine years ago, when it was begun, the population was a little over 2000, and the assessable value something over £7000. Now the population was 4000 and the assessable value £12,000. The total cost of this work would amount to about £12,400. Mr. Strachan said the water was obtained from a total depth of 475 feet. All the machinery was in duplicate, and they had been able to throw 200,000 gallons in twelve hours with a depression in the well of not more than 50ft. The tower was 60ft. high, and the tank at the top was capable of holding 43,000 gallons. The water was soft, coming as it did from the direction of the Isle of Thanet.

At a meeting held last week of the Morley Town Council, plans were adopted for new premises in Queen Street for the London and Midland and the London and Yorkshire Banks. It was decided to make an application to the Local Government Board for sanction to borrow £8000 for the erection and furnishing of baths, according to plans and specifications submitted by Mr. Fox. With reference to the new sewerage works, the town clerk reported the condition of the negotiations for the purchase of land. It was resolved to instruct him to write fully to the Rivers Board and the Local Government Board explaining the present position of the negotiations. It was further resolved that all traders should be required to construct such works on their premises as

would effectually keep out of the sewers all solids and any liquids likely to cause injury to the sewers, but that, subject to this, trade effluents should be received into the sewers and dealt with at the sewage works, the owners of all premises to bear themselves the expense of connecting with the sewers.

MR. WAKE, C.E., Sunderland, consulting engineer to the Aberdeen Harbour Board with respect to the proposed works in connection with the Aberdeen Graving Dock, is in favour of retaining the Graving Dock on its present site—lengthening it if thought necessary—but that Tory would be a desirable site for the dock if in the future it were found needful to remove. He is not in favour of the proposed site at the ship-building yards. He is of opinion that a first and essential step to be taken in the reconstruction of the dock is to surround it on all exposed sides with sheet piling. He proposes that the entrance should be slightly widened, and that the two lowest altar steps of the dock should be taken away and the bottom of the dock raised.

THE second annual meeting of the member of the British Association of Waterworks Engineers was held last week at the Town Hall, Westminster. The retiring President, Mr. G. M. F. Gaskin, Nottingham, in the course of a valedictory address, referred to the Nottingham and Newark Water Bill, and strongly advocated the election of Water Boards, concluding by moving that a sub-committee on this question be re-appointed. This was seconded by Mr. H. Ashton Hill, and carried, the old sub-committee, with the addition of Messrs. W. Whitaker and W. Watts, being re-elected. Mr. H. Ashton Hill, engineer to the South Staffordshire Waterworks Company, was then elected President of the Association for the ensuing year. In the course of his presidential address Mr. Hill said that the Association had amply justified its existence even in these early days. It came into being only fifteen months ago, and in February last it had a roll of 110 members and 32 associates. After giving an epitome of the work of the Association during the past year, Mr. Hill briefly described the works of the South Staffordshire Water Company. He also touched on various matters connected with the duties of a water engineer. After luncheon Mr. W. Whitaker, F.R.S., read a paper on "Some Middlesex Wells." Mr. L. N. Ritson contributed a paper on "The Removal of Internal Corrosion from the Mains of the Kendal Waterworks." Mr. W. Ingham, water engineer, Torquay, contributed a paper on "The Water Supply of Torquay," and Mr. Alfred Fowler, Leeds, read one on "Pumping Machinery," in which he described the pumping station at Everton, belonging to the Liverpool Corporation. The water flows from Lake Vyrnwy, and Rivington Reservoir into a covered reservoir adjoining the engine-house, and is pumped thence into an overhead tank to supply the highest parts of the city. The water engineer, Mr. Parry, decided that the new plant should be able to raise any quantity from 600 to 5000 gallons per minute to the mean vertical height of 102.39ft. This pumping machinery was supplied by Messrs. Hathorn, Davey, and Co., of Leeds, who guaranteed a duty of 120 million gallons per 112lb. of Welsh coal, at a maximum or mean speed, and eighty million at the minimum speed. The paper described in detail the special features of the machinery, whose working had proved entirely satisfactory. In conclusion, the writer asserted that, though the demand for high-duty pumping machinery had not been so keen in this country as abroad, owing probably to cheaper fuel, still, if exceptionally high-duty pumping machinery were demanded, the orders might confidently be placed at home.—Mr. Walter G. Kent read a paper on "The 'Venturi' Meter for the Measurement of Water in Large Mains," and the last paper discussed was one by Mr. L. Holme Lewis on "Hydraulic Power Supply," read by the secretary in the absence of the author.

## COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
<b>BUILDINGS—</b>			
July 30	Crowborough—Residence, Workshops, &c.	Provincial Gas Works Limited	The Engineer, at Works, Crowborough.
" 30	Newport, Mon.—Buildings, &c.	Electricity Committee	Conyers, Kirby, and Son, Stow-chambers, Newport.
" 30	London, S.E.—Swimming Bath	Baths and Washhouse Committee	E. T. Anson and Son, 7A, Laurence Pountney-hill, E.C.
" 30	Barnsley—Dwelling-house, Shaw-lane	Town Council	Wade and Turner, 10, Pitt-street, Barnsley.
" 30	Brighton—Alterations, Municipal School of Art	Governors	F. J. C. May, Town Hall, Brighton.

### Art and Public Interest.

A RECENT issue of the Times devotes a leading article to a survey of Art during the Queen's reign, which, as might have been expected, is largely a survey of painting. Is not this fact, that the leading journal of the Empire is not yet alive to the consciousness that Art does not consist principally of painting, an object lesson on the value and reality of the growth of appreciation and interest which it chronicles? If the Times and the intellectual, cultured public to whom it is supposed to appeal has no wider conception of Art, what are we to expect from anyone else; and of what real value is the present popular interest? In a column and a half, it devotes just nine lines to sculpture, and eleven to Architecture; the rest is devoted to painting and book illustration. Is this a correct measure of popular appreciation of these Arts? The writer points out that the Arts play a far larger part in life than they played sixty years ago. He notices the growing number and importance of Exhibitions, remarks that "the year's Art" contains over five thousand names, and that of these, they who since 1860 have achieved affluence and social position form a larger minority than at any earlier date. He says that "this of course implies nothing as to the intrinsic worth of the Art produced, but it implies that the public interest in Art has increased so as to call into existence a very large class of Artists and to make many of them wealthy men." This is the first time we have heard that the public interest could ever call an Artist into existence. We had an idea that an Artist was born; that his gift came from Nature and not from the public. We should be disposed to say, that whatever the number of Artists born in a generation might be, that number would not be increased or decreased by any amount of public interest, or its opposite. That the number of these Artists who may elect to make their living by the exercise of their powers, is possibly influenced by the state of popular appreciation, may be a fact, and this may be what the writer means. His sentence, as it stands, leads one to imagine that he is under the impression that Art is a sort of commercial product—that it obeys the law of supply and demand. That he

has only to demand it, offer to pay for it, and he is sure to get it. That if, for instance, all the money spent every year on the Navy, or on the Turf, was devoted to the buying of contemporary pictures for the nation, at liberal prices, that all these innumerable pictures would be at once forthcoming, and that they would all be Art; and that the number of Artists would be thereby increased. The real result would be the spoiling of much good canvas by incompetent amateurs, and great energy on the part of the "market produce" man, whom unfortunately we have always with us; but it would hardly stimulate Nature to produce one single Artist more. To the Artist this attitude of mind on the part of the leaders of public opinion is just

but he would like this interest to be just a little more intelligent. The Englishman has often—and never more often than now—been compared to the ancient Roman, and he feels flattered by the comparison. We are afraid that the comparison does hold good to some extent in matters of Art. The Roman patronised Art, but he did not feel it. He understood its use as displaying his wealth and his cultivation, but it never really entered into and influenced his life. He took it up and administered it with a sublime tolerance; used it as an instrument to certain Governmental ends, regulated and labelled it, and perhaps had the saving grace to see he did not understand it. For all his civilization and his empire, where Art was

concerned he was an utter barbarian. There is a decided similarity in all this to the attitude of mind displayed by the English Government and people. During the last sixty years we have grown rich, we have educated our children to a higher standard, we have had a period of profound peace, during which we have all made the "grand tour;" in short, we have found time and inclination to patronise the Arts, or to be more exact, "Art," i.e., painting and "Liberty" knick-knacks. Like the Roman, we think it gives elegance and distinction to our wealth and social position; in fact, it has become a fashionable distraction. But does this show a truer appreciation and knowledge? We think not. And is such a state of comfort and humdrum content stimulating to the Arts? Again we think not. This state of things, this continual babble about Art by people to whom the meaning of the word is a blank, has a tendency to divorce Art from life, to the detriment of both; a tendency to drive Art into exclusiveness; to make the Artist retire into himself with a shrug of his shoulders, and denounce the rest of mankind as barbarians. Art has been accustomed to go its own way, it has grown used to centuries of neglect. The Edinburgh Review was neither the first nor the last to "cultivate literature on a little oatmeal," a diet upon which many an Artist has been known to thrive. But if there is one thing more than another calculated to irritate and disgust, it is the patronage and the inept banalities of a public which measures its Art by the foot superficial. The Times notices that in a modern Academy Exhibition almost the only quality that the Artists possess in common is a manual dexterity far greater than was possessed by any but a very few a generation ago. After giving a reason for this it remarks: "But of great Art there is little and will be little until the modern world shall have come to some kind of agreement as to what the Artist's function is and what his aims should be." Now, with all respect, this is a matter with which the

VILLAGE CHURCH TOWERS OF EAST DEVON. SKETCHED BY R. W. SAMPSON.

heartrending. It does not perhaps altogether become him to complain of the public interest, which often secures him a commission and a living, though he more often sees these go to his imitators, the practitioners of painting;

will be little until the modern world shall have come to some kind of agreement as to what the Artist's function is and what his aims should be." Now, with all respect, this is a matter with which the

modern world has nothing whatever to do. There never was any doubt as to what the Artist's function is and what his aims should be. The Artist's function is simply to produce Art and his aim should be to produce the very best. Beyond that he has neither function nor aims. The doubt may be as to what is the best Art, and what is the best way of producing it, but these are matters for the Artist to settle; the modern world can best help him by leaving him severely alone to develop his powers as Nature and his reason dictate. If the "modern world" wants great Art, let it set to and live a great life, it may then find its greatness reflected in its Art; as it is the Artist finds the modern world—well—not exactly inspiring. We see in this remark the tendency of the modern world to bring Art within its administrative machinery, to find its proper place in the social structure and to fit it in; to regulate and control it, in fact to come to some kind of agreement as to what its function and aims should be, precisely as the Romans did before. Let us take a lesson from history and not repeat its mistake. We have lately seen Art told off to serve the ends of commerce, to assist in keeping out the German manufacturer. A Government department, officials without number, and rules and regulations enough, one would think, to run the whole Empire, have been established to control it. We know the effect of all this on Art; perhaps the Times can tell us its effect on the German manufacturer. Great is the genius of the English people for government and administration, but there are some things that will not be governed—that refuse to be administered. Of these is Art. It is not a system, but a quickening spirit.

#### NATIONAL DEFENCE.

##### A GIGANTIC SCHEME AT GIBRALTAR.

THE new naval dock and harbour works at Gibraltar have now begun to assume tangible shape. At present there is no place available between Malta and England for our men-of-war to refit, or be docked, and what this would mean in case of war can be imagined. Happily Parliament has voted the money required, and the new defence works when completed will be another link in our chain of defence, and will materially increase the value of the Mediterranean Fleet, by enabling it to refit after an engagement, without any portion of it leaving that sea. The outward aspect of part of Gibraltar has changed, as has even the very shape of the "rock," since the latter part of 1894, when work was commenced, so great is the quantity of stone that has been used, and Gibraltar supplies it all. People who knew that part of the place called Rosia, and the New Mole Parade, would hardly recognise it to-day. The "Parade" has ceased to exist, as has

##### THE OLD DOCKYARD APPROACH,

and several prominent buildings, including the old clock-tower, have been pulled down to make room for the docks. The clock from the tower is to be put up in a new tower building. This clock marked the hour our victorious fleet entered Gibraltar Bay, after the "glorious battle of Trafalgar." The erstwhile New Mole Parade is now part of one of the dock basins, and is excavated some 40ft., the solid limestone retaining walls of which are now complete. The lower batteries along the line wall have been dismantled, as the guns could no longer be fired with safety, and the fortress is to-day well defended from the "Upper Rock." The naval dockyard is now approached by a fine broad road, with an easy slope so that carriages can drive down to the quays, a great contrast to the old style, when it was necessary to go down some hundred steps, and all baggage, &c., had to be lowered over a bastion wall in a primitive way by means of a

hand crane. Speaking generally, the new works are as follows:—

1. The extension of the new or naval mole.
2. The construction of a central mole, to take the form of a breakwater.
3. The extension of the old mole or "Devil's Tongue," to be the mercantile portion of the harbour. This mole is to be provided with coal sheds, as already exist on the naval mole.
4. The construction of three docks capable of accommodating the largest battleships and cruisers.

The naval entrance to the harbour will be 200yds. wide, the width of the commercial entrance being as yet undetermined. The total area to be enclosed by the new harbour will be some 640-acres. The sea-water ditch which surrounded the outer defences of the fortress has been filled in, and seaward for a distance of about 240 yards quays are to be built, which will run due west up to the

in number, and of the following dimensions: 850ft., 600ft., and 550ft. And it is stated that they and the harbour are to be completed by 1900, but though the harbour may be finished, there is but

##### A VERY REMOTE POSSIBILITY

of the docks being completed for another eight years or so—and this is the opinion of a first-rate engineer on the spot—unless the Government gives the work out to contract, when it is just possible that they might be ready in four years' time. At present the work on the docks is not in full swing; in fact, the Admiralty has not yet decided whether the construction of the docks is to be put out to contract or carried on by the newly-formed "civil staff" under the "Defence Loan." The money has been voted, and work should be carried on with the greatest possible speed. It is said that alterations of plans at home have much delayed the work. As to the position of the docks, it is to be regretted that

VILLAGE CHURCH TOWERS IN EAST DEVON. SKETCHED BY R. W. SAMPSON.

entrance of the docks. The original length of the new mole was about 1330ft., which during the last two-and-a-half years has been extended another 950ft., or to a total of 2280ft. Up to this point the section of the work is similar, the base being about 270ft., and the width at the top is 100ft. Coal sheds, with a capacity of about 9000 tons, exist on the original portion of the mole, and these will probably be extended to the end of the whole work, which is to have a total length of three-quarters of a mile. Up to a length of 760yds., or 2280ft., the

##### BUILDING OF THE QUAY WALL

is in a forward state; beyond this the mole is being pushed out to a greater distance of some 1700ft., and rubble footings are in progress. This, the last section of the work, will be only some 30ft. wide at the top. When the mole is completed eight battleships will be able to go alongside the quay at one time, and the new harbour will afford a perfectly secure anchorage for "the whole Mediterranean Fleet," both against weather and torpedo attacks, as the entrances to the harbour will be secured by booms, if required. The central mole is to be about 2700ft. in length, and is to be of section similar to the last 1700ft. of the naval mole. The average depth of water is 60ft., so it will be seen that enormous quantities of stone are required for the extensions. In a single day as many as 1300 tons of stone have been deposited in the sea by barges—all three moles are being constructed simultaneously by an English firm of contractors, who are doing their work rapidly. The docks are to be three

no other suitable site could be found, as they will be liable to be shelled by Spanish land batteries on the opposite coast of Spain, which is well within range of modern guns. Doubtless expense would be great, and there would be other objections, but could the docks have been constructed on the west of the "Rock" they would be secure from hostile fire from land batteries. In the construction, Spanish labour is almost entirely employed, some 2500 Spaniards entering the fortress at morning gunfire from the towns of Algeciras and La Línea. About £650 sterling is paid daily in wages, but when the docks are in full swing the wage bill will be much higher. The

##### STONE FOR THE WORKS

is obtained from quarries at Catalan Bay, on the east side of the Rock, and from Europa at the south end of the Rock. A double line of railway runs from Catalan Bay across the north front to a long wooden pier, where the stone is tilted into iron lighters, which are towed three at a time out to sea, and the material deposited. To facilitate the works, a tunnel is now being bored right through the Rock, from east to west, a distance of three-quarters of a mile, and this will save much time and labour. This tunnel has been in progress for about eight weeks, and already some 230 yards has been excavated at either end. It is suggested, as the tunnel would be a weakening of the defence of the fortress, that after it has served its temporary use, it might be concreted, and made into a tank for drinking water.

MANY of the Churches and Church Towers of East Devon are of more interest pictorially than Architecturally, by which I mean that in many cases a Church with a simple square tower has been so happily placed in the landscape as to immediately take the attention of the painter, focussing and lending interest, as it does, to the whole surrounding country. Such an one is Axmouth, placed on the margin of a broad tidal river, at but a little distance from the sea, and, backed by a lovely hill, it shines like a jewel in the setting sun, and makes one long for the skill of a Turner, that he may carry away with him so sweet a scene; and yet, on closer inspection, it is only the very rabid sketcher who would stay to note so very ordinary a piece of work, resembling as it does so closely, one might almost say, scores of others.

Newton Poppleford, here illustrated, is another instance in which distance lends enchantment to the view. Perched upon a hill in the middle distance, it is most helpful to the composition of the landscape, as many a painter has found—for the village is much visited by the fraternity of the brush; whereas a closer acquaintance only leads to disappointment, for the tower is little better than a ruin, though even then far preferable to the remainder of the Church, which has been "restored"—writ large. I know not what it was like before, but I think it highly improbable that it was lined inside with *white glazed bricks*, as it now is. And, bless you! the villagers think it a marvel of elegance. What more would you have?

There are examples, however, both of picturesquely situated and restored Churches which will more than repay the closest inspection, and the most notable amongst those here illustrated is Sidbury (accidentally misnamed on drawing Sidford), which with its oak shingle spire, may be seen to advantage from a dozen points, making a charming picture from almost any of them, with its village of plastered and thatched cottages nestling around it. The tower, originally Norman throughout, has still Norman arches, and carvings of much interest on the ground story, and the belfry also retains its original form; the parapet and pinnacles added at the last restoration, for it had undergone restoration before, when the tower was capped with a most unsightly roof, and the before-mentioned oak shingle spire form a very happy combination, and if it were not that this article is devoted to towers, there is much in the rest of the Church well worthy of note and description. The restoration is one of the best I have seen either in this or any other county, and the new stained glass is unimpeachable; but Sidbury is fortunate in having a wealthy Lord of the Manor, to wit, Sir Charles Cave, father of the promising young Architect of the same name.

Talaton, again, perhaps the most charming of the unrestored towers here shown, is alike of interest to the landscapeist or the Architect. Built of a soft white stone in the last period of the Gothic age, it has suffered considerably

at the hands of Time, and the detail is not readily distinguished, but the outline and proportion are alike beautiful, whether viewed from the churchyard or from half a mile away, and the niches and figures round the staircase turret are a somewhat unique and very happy introduction. The Church contains a very fine oak screen, and a monument to the daughter of Sir William Chambers, gentleman, and Surveyor of Works to His Majesty King George III., as the monument has it—better known to us as the Architect of Somerset House.

Whimpe, to make free with Gilbert's lines, "would pass very well for good Gothic in the dusk, with the light behind it," and it was thus

I first saw it from the train. Its squat appearance is not without charm, but its detail will not bear close inspection.

Harpford, the dominant feature of a tiny village at a distance of about a mile from Newton Poppleford; this tower is, again, similar in many respects to a number of others in the district, though, perhaps, more badly built than some, the walling being of rough stone plastered and finished, I should think, originally rough cast, now in a very bad state of repair. The body of the Church has been restored—badly, as usual—but the tower for some reason, probably want of funds, has been left severely alone.

SKETCHED BY R. W. SAMPSON.

The author of a guide-book of the neighbourhood of Branscombe is a wise man, and his method of avoiding the difficulties of the subject of Architecture is delightfully simple and effective, for it would apply equally to almost any old Church in the country. He simply says: "The Church, an ancient building of stone, is in the Norman and later styles," he mentions the name of the vicar, and that there are some curious ancient monuments, with kneeling effigies, and so disposes of one of the most interesting and charming old Churches in the county, to attend service in which is to imagine oneself back in the seventeenth century at least. No handiwork of the demon Restorer is here to be seen—nothing can have been touched for at least a hundred years, and the newest thing in connection with it I should imagine to be its vicar, and he is so old in its service as to have become part of its very self. Perched up there in his Jacobean three-deck pulpit (from which he has been known to descend to chastise an unruly juvenile member of the congregation), he does not at all jar on the old-world picture which the place inevitably conjures up. Indeed, there is nothing to do so, for the pews are very high, and effectually hide the nineteenth century female head-dress, which even in this dear, old, sleepy hollow has forced its aggressive splendour.

But to resume the subject of towers, the guide-book description will not quite do for this one, for it is Norman from base to parapet, and has the somewhat unusual feature of a round staircase turret; it is not placed at the west end of the Church, as is the general rule with these village Churches, but in the centre of a long nave, and in this respect resembles Colyton.

In making my selection of towers to illustrate this article, it has been my endeavour to give as many types as possible, and, though they are not all of equal merit architecturally, they give a better idea of the variety of design

of the towers than could be shown if merit and merit alone were rigidly adhered to, and considering that the district from which they are drawn would be covered by a radius of ten miles, I think it must be admitted that the locality can bear favourable comparison with many other parts of the country more noted for their past efforts in this direction. Somerset, to wit, so noted for its beautiful Perpendicular towers, can hardly boast so much variety of outline, and, although superior in detail to most of the East Devon Churches, are inclined to suggest that the same Architect may have been the author of the greater number of them; a drawback, if it be one, which cannot suggest itself here.

Colyton Tower is unlike anything I have seen in Devonshire. It is a Church which even now (after perhaps even worse restoration than has fallen to the lot of many) is full of interest for the student apart from its tower, which I am inclined to think is doubtful Gothic, though it is credited locally as being good, and of the period it purports to be; but a cistern-head of eighteenth century design disturbs one's peace of mind on the subject, and certainly the large gilded weathercock and its supports are contemporaneous with those rain-water heads. However, it is by no means offensive when viewed at close quarters, and when seen from the hill approaching the village from the west, it is exceedingly pretty.

This tower, and a good portion of the walling of the Church, is built with very large snapped and coursed flints; the quoins, parapet, and lantern being of ashlar. The rebuilding of one of

the piers supporting the tower is said to have been wonderfully performed many years ago by a local amateur Architect. Let us hope he was also responsible for the new seating and other things; it will at least relieve the Profession of the addition of another sin to its already heavy burden.

Colyton has at one time been a place of some importance, and has here and there some mouldering but interesting bits of architectural detail. Shute House and Ford Abbey, both houses of much interest, the former the residence for the last century of the Pole family, and Ashe House, the birthplace of the great Duke of Marlborough, is also close at hand on the borders of Dorset.

Few villages of its size can boast such a Church tower as Broadhembury, a really fine tower, with good detail and some unusual features. The pinnacles, for instance, are octagonal on plan, and are ornamented with miniature battlements and very small crockets. The staircase turret has a conical lead roof, and the battlements round this are unusually small. The walling is of a hard flint-like stone with Ashlar quoins, those ap-

pearing dark in the illustration are of a red stone, much more in use in Mid-Devon, where it is found.

Next to the tower the most interesting feature of this Church is its north porch, with its Jacobean gates and exquisitely carved perpendicular doorway. Next to this, perhaps, is the interesting fact that the living was once held by Augustus Toplady, of hymn-writing fame.

This Church has had the good fortune to have been restored under the able guidance of Fellowes Prynne, who is at present engaged upon the beautifying of the neighbouring Church of Peyhembury, and that in a most sumptuous manner, at the sole expense, be it known, of the vicar. Would that more were like him!

I should much like to describe this Peyhembury Church, but as its tower is of no interest, it is beyond the scope of this article.

Whether entering the village of Feniton from the right or the left you fail to spy the Church, a most unusual thing, for the Church is most often the one thing that advertises the fact to the wayfarer on the high road that a hamlet nestles yonder; but here the sweet little building is carefully hidden away, round the corner, so to speak, and hedged in all round with tall trees, as if to protect it from Cromwellian observation from the London Road, which passes the spot quite hidden from view but a few hundred yards distant.

The tower of Feniton Church, as will be seen from the illustration, is a simple, well-proportioned, and graceful building, which calls for no further comment, whereas, like Peyhembury, a great deal might be said of

SKETCHED BY R. W. SAMPSON.

the other part of the Church. The south wall of the nave, for instance, contains a row of the most charming Perpendicular windows, and the interior, amongst other things, has a lovely carved and much gilded oak screen, of very similar design, however, to those in Talaton and Peyhembury Churches.

Perhaps I ought to apologise for the introduction of Sidmouth Church tower, for, strictly speaking, Sidmouth is not a village, but a charming little seaside town revelling in all the advantages of a glorious climate and an Urban District Council, which latter ever and anon threatens to mitigate the advantages of the former by the heated and coloured atmosphere of their discussions as to whether one dustman is sufficient for the needs of the town, or some equally important question.

But, beside this, Sidmouth enjoys the distinction of having had Her Majesty the Queen a resident on its shores in her childhood, and the Church tower contains a stained glass window in its west front put in by Her Majesty in memory of her father, the Duke of Kent, who died here, so that the tower being a good one, and the town serving as the base of my operations in taking these notes, I may, perhaps, be excused for giving it in this series.

There is an octagon staircase turret on the south side of the tower, and the only noticeable features, other than the before-said window, are the belfry windows, which seem to be filled with odd bits of tracery in place of louvres.

The Church, a large one, is situated almost in the centre of the town, but, with the exception of its tower, has no claim to be considered of any architectural interest.

Drifting and being fixed by chance into this beautiful locality of East Devon, and making the acquaintance of another victim of circumstances in the shape of a would-be literary man, who was at that time occupying himself in about equal degrees between the tuition of a delicate boy, the ancient game of his forefathers, golf—for he and his pupil were from north of the Tweed—and setting all the countryside afire with his advanced Radical theories, it came about that he and I, being of totally different temperaments, chummed, and tramped the county round for many a mile on many a Saturday afternoon, and it was then it occurred to me that a series of sketches such as these, only of a more general interest and character, assisted by his graphic pen, might catch the eye and fancy of an editor somewhere, and so be the means of defraying the cost of tobacco, tea, and other refreshments consumed upon these "Tramps at Home," for such was to be the title of these wanderings of ours. Alas, that title was the one and only one brilliant idea that occurred to my friend, the literary man. We would tramp, and alighting on a likely spot, which always included a pub, we would part—I to sketch, he to hunt up the village "know-all," and take copious notes for future copy on his return home.

A NEW bridge spanning the Regent's Canal at King's-road, St. Pancras, was opened last week.

AN anonymous donor has given funds for a fountain to be erected in Albert Square, Manchester, to commemorate the Queen's Jubilee, and the bringing of water from Thirlmere to the city. The design will be entrusted to an Architect and not to a Sculptor.

THE opening of the new Town Hall at Hammersmith took place on the 22nd ult. The Town Hall, which has been erected at a cost of £25,000, provides accommodation for the vestry officials, as well as a council chamber, committee rooms, and a public hall seating between 600 and 700 persons. Externally the building has a very handsome appearance.

THE Jack Straw's Castle at Hampstead was sold last week for £34,500. The inn, which is a very old one, is situated on the top of Hampstead Heath, and an inscription on the bottom-most of a flight of steps leading up to its main door records that it is on a level with the cross on the dome of St. Paul's Cathedral. It has associations connected with Dickens, Thackeray, Du Maurier, and Lord Leighton.

#### BRITISH ART ABROAD.

THE International Exhibition at Brussels is now in the full tide of success, the entrance money, subscriptions, and concessions having already, it is said, more than paid the expenses of the undertaking. The first reason for this financial success is that little or no outlay was required for the main building, which is the same that was originally put up in the Parc du Cinquantenaire in 1880 for the Exhibition which celebrated the fiftieth year of

"Old Brussels"—Bruxelles-Kermesse—with very prettily contrived streets and shops, and, in the evening, the customary amusements. Before speaking of the Fine Art department, and especially of the British section of it (writes a correspondent of the Times), I may touch very briefly upon the general industrial department, which is, of course, in the eyes of the organisers and the general public, the most important. Here the success is very varied, for while two countries, Belgium and France, are remarkable, the rest,

SKETCHED BY R. W. SAMPSON.

Belgian independence. In one wing of this roomy but ugly edifice is installed the Belgian South Kensington, a permanent museum of antiquities, chiefly mediæval and national, some of which—especially the wood carvings—are very fine. The corresponding wing is used as a great *salle des fêtes*, for orchestral concerts and formal functions of every sort; and between and behind are large exhibition buildings of the usual kind. Outside we have restaurants and lounges, gardens which are illuminated at night, and the inevitable

including England, are but poorly represented. From Belgium of course one expects a great deal on such an occasion, and the show is large and good. In china, glass, lace, silversmiths' work, and furniture, Belgium is admirable, though the work is in many cases scarcely to be distinguished from that of France, from which most of the models come. But, though there is little originality, there are taste and good workmanship, offering what to the English visitor is rather a painful contrast to much of what is to be seen in

the British Section. Still more is this the case with the French section, which is first-rate, and a stroll through which is a real pleasure. This section, it may be urged, has had an unfair advantage; it had a great deal of money to spend on its installation. So it had; but this would have counted for little without two other elements, taste and subordination. The matter was put absolutely into the hands of a small commission, and everybody had to accept the place and the showcase assigned him. Hence the delightful *coup d'œil* of the whole section, whereas our own is, if the truth must be told, ugly, unsystematic, and unattractive. If our industrial section is ineffective in comparison with the display made by some other nations, the case is different in the department of Fine Art. Here a strong Committee, headed by Sir Edward Poynter, has worked well, and even more than this must be said of the honorary secretary, Mr. Isidore Spielmann, F.S.A., who has devoted much time and boundless energy to make the section a success. The result has surpassed all expectations, and everybody, from the King of the Belgians downwards, has been surprised and delighted with the excellence of the British work. It is true that England is no longer regarded by foreigners as it was regarded fifty years ago, as a barren and a stony land in which

#### THE ARTS CANNOT GROW.

We began to make our mark in 1855, and we deepened it at many other dates, especially in the Paris Exhibition of 1889. Now the richest Frenchmen compete with the richest Englishmen in buying English pictures—old ones, to be sure; Sir Joshuas, and Turners, and Constables; and from them the knowledge filters down slowly, so that the Belgian amateur and Artist are not utterly taken aback when they find Englishmen who can paint. But this knowledge is a plant of slow growth, and it will not grow at all unless advantage is taken of each opportunity that presents itself. It is pleasant, therefore, to

record that Mr. Spielmann and his committee have brought together the best collection of modern English pictures and drawings that has ever left the shores of England; better than the collection made for Paris in 1889, or than that made for Chicago in 1894. There is very little sculpture, and the "black and white" would look better if more space had been assigned to it, and if

#### SOME OF THE BEST MEZZOTINTS

had been better hung. The oil pictures are over 200 in number, the water-colours rather more than half as many, and in the former department very few living British Artists of eminence are omitted. Mr. Whistler is not here, but he is of uncertain nationality and of no school. Mr. Guthrie and some of his Scottish brethren have sent nothing; but the list of exhibitors is, if we allow for these omissions, singularly complete. Of illustrious painters who have lately died we have fine works by Millais, Leighton, and Henry Moore, each of whom has made a real impression upon the Belgians. Millais's "Bubbles," hackneyed as it is, meets with proper admiration for its fine painting, its grace, and the understanding of child-life that it reveals; his "Mrs. Jopling," though the colour in one or two places appears to have changed, is accepted as a masterly and most convincing portrait; but the chief tributes are borne to that marvellous little picture

#### "THE WHITE COCKADE."

How is it that a man who could paint this and the two pictures now at the Guildhall, "The Huguenot" and "The Gambler's Wife," did not more often paint to this scale, where his extraordinary technique, his unrivalled power of getting what Artists call "quality" into a picture, served him far better than in any but a very few of the life-size subjects? Lord Leighton's pictures are not his best, but "Corinna of Tanagra" is a fair example of his late formal manner, and the child called "The Listener" is a brilliant little work in its way. The sea-pieces by Henry Moore have shown the Belgians what was long ago discovered by the Parisians, that England possessed in him the greatest sea-painter of his time, though the two pictures here are not of the first rank

ago at the Academy. Of these "The Wheel of Fortune" has made perhaps the deepest impression; Belgium was not prepared to see such fine symbolism expressed so nobly, or with such perfection of paint. It is worth recording that when this picture, which was one of the earliest arrivals, was being put in position, the Belgian Committee was so much impressed that it straightway raised

#### THE STANDARD OF EXHIBITION

in its own section and refused several pictures which awaited admission. Bad work, it thought, should not be tolerated in the same gallery with a picture like this. Mr. Alma-Tadema and his family are also here in force, but the Belgians have long been familiar with the work of the eminent pupil of their own Leys, nor will they admit that long residence in London has made an Englishman of him. Sir William Richmond's "Prince Bismarck" attracts attention, both for its subject's sake and for the careful painting of the head; and the Belgian Artists have plenty of admiration to spare for the elaborate detail, the brilliant technical qualities of Mr. Dicksee's "The Mirror," while, like ourselves, they complain of its unreality. The vast "Mariamne" of Mr. J. W. Waterhouse puzzles them a good deal, for neither Catholics nor Freethinkers are well up in the history of the Herods; and in looking at Mr. Gow's "The Sands of Boulogne, 1805"—Napoleon contemplating the invasion of England—they are inclined to echo the malicious little remark of the King of the Belgians the other day to the Committee showing him round, "If the sea was so calm, why did he not invade?"

#### OUR LANDSCAPES

have much success, especially the picture of the late Mr. Vicat Cole, the shorepieces of Mr. Hook, the beautiful "Ides of March" of Mr. North, the "Cider Country" of Mr. Parsons, and the works of Mr. David Murray, Mr. Boughton, Mr. Aumonier, and Mr. Corbet. So have the water-colours, of which the Exhibition contains a very fairly representative collection, though the drawings are chosen rather from the Institute than from the Old Society. It is a pity that there is nothing by Mr. Albert Goodwin, or by the late Alfred

VILLAGE CHURCH TOWERS OF EAST DEVON. SKETCHED BY R. W. SAMPSON.

among his works. Of our living painters a leading place is taken by Mr. Watts ("Head of Mr. Walter Crane"); by Sir E. Burne-Jones, who sends the later version of

#### "LOVE AMONG THE RUINS,"

and Mr. Balfour's "Wheel of Fortune"; by Sir Edward Poynter, who exhibits two small pictures, "On the Terrace" and "Knuckle-bone Players," and a landscape in water-colour; and by Mr. Orchardson, who sends that portrait of Mrs. Joseph which had so much success when it was shown a few years

Hunt, or by Sir John Gilbert, who might have stood for romantic imagination, subtlety, and wealth of colour. Failing them the people of Brussels are inclined to place almost at the head of our landscapists in water-colour three men who are no longer with us, H. G. Hine, George Frupp, and Thomas Collier, of whom the two former lately died at a ripe old age, while the last was cut off in early life, having shortened his years by his devotion, in season and out of season, to our capricious English Nature, whether she smiled or frowned. Hine's marvellous renderings of the South Downs and

VILLAGE CHURCH TOWERS OF EAST DEVON. SIDMOUTH. SKETCHED BY R. W. SAMPSON.

the delicate foreground in Fripp's "Glencoe" are examples of an

#### ART THAT IS HARDLY PRACTISED

to-day, especially in Belgium and Holland; but Artists, whatever their training, cannot fail to appreciate work so genuine and skill so unusual. Mrs. Allingham's pretty Surrey scenes have the success which belongs to the idyll, not less in our agitated modern time than when the world was simpler; and the pleasant Art of Miss Gow also finds admirers. The "New Barn, Rottingdean," of Sir Edward Poynter is a drawing which we do not remember to have seen before; it has style and colour, the marks of all the rare landscape work of this distinguished Artist. The zealous "British representative," who remains in Brussels to watch over the interests of the British section, Mr. John Fulleylove, lends one or two of those drawings of famous buildings which are such a marked feature of the Institute Exhibitions; his "British Museum" is an admirable work, in which the Artist shows that he has realised the essentially fine qualities of that front,

#### SMOKE-BEGRIMED AND FORBIDDING

as it now is. A word may be given to the other sections of the department of fine Art, of which some are interesting and one or two important. Italy is unfortunately very bad;

B B B 2

only one Artist emerges, Signor Casciaro, of Naples, whose pastel views of that region are of rare and excellent quality. From Germany there is very little, while Holland naturally sends a good deal, the pictures of Israels, of James Maris, of Mesdag, and of the late Johannes Bosboom, well maintaining the reputation of the School. France, again, is strong, and gives ample evidence of the vitality which, whatever we may think of her Artistic ideals, still animates her painters, her sculptors, and her medalists. We have a good many well-known pictures or designs from M. Puvis de Chavannes, M. Carolus-Duran, M. Jules Lefèvre, and others of the older generation; a beautiful full-length portrait by M. Blanche; a wonderful man's head by M. Gabriel Ferrier, in Holbein's manner; landscapes by MM. Pointelin, René Billotte, and Demont; and a whole roomful of sculpture. To this school the Belgians show some natural affinity, but the influence is by no means exclusive, and men like M. Fernand Khnopff on the one hand and M. Van Hove on the other look elsewhere — M. Khnopff to Sir E. Burne-Jones and the Italian primitives, and M. Van Hove to the early Flemish painters. Probably M. Van Hove will not make many disciples, but his work has great technical merits, and one respects his ideals.

#### ANTIQUARIAN RESEARCHES IN YORKSHIRE.

TO call those Danes' graves which do not and never have contained Danes' bodies, is not a case of *lucus a non*, but proceeds from a definite method of our ancestors. When they came across anything they did not understand, they attributed it either to the Danes, from whom they suffered considerably, or else to the Devil, from whom they feared they might suffer in time. So they had Danes' dyke at Flambro', a work evidently done by people who only knew how to use flint instruments, whereas Danes were perfectly acquainted with iron; and they had Devil's dyke, and Devil's punch-bowl, &c., everywhere. So the fact that the graves in Danes' Dale, about four miles north of Driffield, were always called after our Danish invaders, did not deceive any one who knew how loosely such nomenclature was bestowed. For a long time the antiquaries and barrow openers of Yorkshire had their eye upon these graves, but all investigation was forbidden as long as the late Colonel Broadley, M.P., lived, as he feared the remains might not be treated with proper reverence. Last year he died, and the new owner, under certain stipulations, allowed the graves to be opened. What little was previously known as to their contents was owing to an accident of a storm in 1881, when, some trees being uprooted, several graves were exposed to view. The bodies inside them were found doubled up

#### IN TRUE ANCIENT BRITISH FASHION,

the knees pulled up towards the chin, the arms more or less doubled so as to admit the hands to approach the head. One or two things were settled then. The bodies belonged to a pre-Christian age, as was shown by the direction of the head. Of three bodies then visible one had its head towards the north, another to the south, and the other to the west. A few pieces of pottery found were declared by Professor Herbst, the Copenhagen archaeologist, not to be Scandinavian, either in shape or fabric. From the skulls exposed it was considered they belonged to a distinctly marked community of men, but of what date could not be certain until further investigation was made. Moreover, the absence of any iron instrument increased the doubts about them; not that it proved iron was unknown at the time, for the wet and corrosive nature of the soil would in the course of centuries have destroyed all trace of it. The secret of the graves remained a secret. The day for unravelling the secret arrived on July 7, when, under the auspices of the East Riding Antiquarian Society, permission to open the graves was obtained, and the necessary excavations carried out. Eleven mounds were exposed, of which only three contained anything besides the corpses all in the curled up position referred to, and in one was discovered the

#### IRON TYRE OF A CHARIOT WHEEL,

the iron bit and trappings of a horse, and a bronze pin, beautifully designed and enamelled. These were sufficient to enable an antiquary to settle beyond doubt the date to which the graves belong. They were neither those of Danes, nor of those who fought against Harold (as another tradition said), but belonged to an age at least a thousand years before the Conquest, and prior to the Roman invasion. Here was additional evidence to prove, if evidence was wanted, that the people who opposed the legions of Caesar in this island were far from being naked savages with their bodies covered with woad, but were clothed as sufficiently as we are, had buttons to their dresses, and other conveniences. They were people possessed of a considerable amount of civilisation, and had beautiful weapons and implements, because nothing could exceed the grace of the spear-heads and swords used by them, specimens of which are so frequently found on the Yorkshire Wolds. The tyre of the chariot-wheel and the bits of the horses were proof of a belief in immortality, they being placed there for their owner's use in another world, and also proved that Caesar was met by men who

drove well-made chariots, albeit the great authority on the subject, Canon Greenwell, said he had never yet seen any trace of the scythes which are said to have been attached to the wheels, and which did such execution upon the legs of the enemy. What is certain is that Caesar met with such a reception from

#### THESE EARLY IRON-USING PEOPLE

that he never made the attempt again, and it was not till a century later that, under Claudius, the Romans conquered the country. The finding of the enamelled pin started the question whether these ancient Britons were or were not the discoverers of enamel. It seems quite certain that no trace of enamel is found in any Roman ornament before the Romans came in contact with the inhabitants of Britain, and it is equally certain that after that the presence of enamel was frequent. It is generally supposed that these bronze-using people came from South Germany, and may have brought the secret of enamel-making with them. They conquered the stone-using people, but did not extirpate them, but lived with them and inter-married with them. Extirpation only follows where the conquering people are vastly superior to those conquered, as the Spaniards were to the Caribs of the West Indies, or the whites to the North American Indians. These introducers of iron into Britain are sometimes described as the round-headed people, as distinguished from the long-headed people, whom they found here, and conquered. The enamelled pin is to rest in York Museum, and the mounds have now been covered up. It is, however, something to have settled the date of the introduction of the use of iron in our country, and to have corrected a false impression as to the nationality of the occupants of the graves.

#### ABERDEEN'S NEW COLLEGE BUILDINGS.

COMPARATIVELY few, probably, of the hundreds who in a week pass the gates of Blairs College, Aberdeen, ever think of moving inside these gates to remark the quaint and rambling college buildings, soon to be displaced by new erections. The building scheme as a whole involves, of course, a completely new college, for the present one has for a considerable time been felt to be wholly inadequate for the requirements. It was gifted to the Church by Menzies of Pitfodels exactly seventy years ago, and, an old building then, it may well be imagined to be somewhat insufficient now. The complete scheme, however—which will cost something like £20,000—is not expected to be attained for some time to come. The first section is now being finished, and Canon Chisholm has the pleasure of showing visitors the first fruits of what, when completed, will be one of the finest piles of buildings in connection with the Roman Catholic Church in Scotland. The new college, when completed, will consist of a front block, facing towards the river, and east and west wings, forming

#### THREE SIDES OF A SQUARE,

with the hollow facing southward. A handsome tower will raise its graceful crest above the surrounding woods, and indicate to the country round about the situation of this seat of learning. The section all but complete is the west wing—a building three storeys high and about 150ft. long, and of outside appearance and internal arrangement that make it very complete in itself. The building, as will be gathered, fronts the west. It is built of Aberdeen grey granite, pointed, which gives it a clean and dressy look; and increased style is gained by projecting forward a short wing at each end and finishing one of these in a bow-window form and the other with a balcony. Here the professorial staff will have airy and handsome quarters, whence, in hours of relaxation, they may enjoy the magnificent prospect up the valley of the Dee that now unfolds itself to the view. The building is

#### TRAVERSED BY A CENTRAL CORRIDOR

12ft. wide. The ground floor is appropriated mainly to class-room purposes. As the ground

floor will be the special quarters of the students, the first floor will be the possession of the Rector and professors. At the north end, above the students' study, is the Rector's sitting-room, with attendant apartments. Then along the corridor that follows the line of the more spacious corridor below are the professors' rooms, each professor having a compact little sitting-room on one side of the corridor facing the west, and a bedroom on the other side with an exposure towards the rising sun. At the south end of this corridor, and above the students' recreation-room, is a large recreation-room for the professors, with the open balcony to which reference has already been made. The upper story is wholly utilised as three large dormitories for the students. Provision is made in the new dormitories for a hundred, and these lofty, airy, and magnificently-lighted rooms are a great change from the sleeping apartments of the old house.

#### THE CUBICLE SYSTEM

is adopted for the beds. A double row of cubicles runs down the centre of each dormitory, separated by a longitudinal partition, a cubicle for each student, and, as the side walls of the cubicles rise only to a height of half-a-dozen feet, ample play of ventilation is afforded. All the internal furnishings of the college—dadoes, skirting, linings, &c.—are in rich pitch-pine, with plastered walls and ceilings. Natural ventilation is adopted, and heating by hot-water circulation. Electricity is to be the artificial lighting—a striking change from the paraffin lamps that do duty in the old house—the engine and boiler houses being situated at the southern extremity of the new block. In the same vicinity is a line of low buildings, comprising students' cloak-room, boot-room, lavatories, &c., all in the same forward state as the adjoining larger building. At the present time the place is in the hands of plasterers and joiners, but it is anticipated that it will be ready for occupancy at the close of the vacation on Sept. 1st. It will be seen that the new block—which is estimated to cost about £8000, and of which Mr. Robert G. Wilson is Architect—is complete in respect of its educational, recreative, and sleeping accommodation for the students and the professorial staff.

#### WILTSHIRE ARCHÆOLOGICAL SOCIETY.

THE members of the Wiltshire Archæological and Natural History Society are holding their summer meeting at Bradford-on-Avon. The report stated that at the present time there were 333 annual members, 21 life members, and 19 exchange members, making a total of 373, which was a decrease from the numbers last year. The additions to the library and museum had been again considerable, and they were distinguished in the magazine with the donors' names. The railway proposed to be constructed by the Great Western Company from Pewsey to Salisbury would pass near many of the important relics to which solitude and remoteness were protection; and, with 40,000 acres for military manoeuvres, the absence of the protection of solitude and remoteness was likely to become a melancholy reality before their next meeting. Education and improved taste must be relied upon for the due preservation of the relics of Salisbury Plain. The cutting and levelling of some short lines of railway in the county ought to give geologists an opportunity for further research. Among the places of interest visited was the old Saxon Church, the members being under the guidance of Mr. C. S. Adye, who gave some interesting particulars respecting the structure. It was the Church of St. Laurence, and the late Canon Jones, vicar of Bradford-on-Avon, discovered it. There are nave, chancel, and a porch on the north side of the nave. The original step of the chancel, although much worn, is still *in situ*, and is well worthy of inspection.

#### THE WALLS OF THE CHURCH

are of various thicknesses from 2ft. 4in. to 2ft. 6in. There were no doors to the entrances on the north or south side, and Mr.

Adye conjectured that the nave was at all times open to the people, while the chancel would only be exposed to view during Divine service. The building was evidently insufficiently lighted, as there were only three original windows. The chancel window remains just as when it was first built; but the other two windows have been mutilated. Mr. Adye suggested that perhaps the deficiency of light might be due to the fact that glass was difficult, if not impossible, to obtain. A visitor asked if service was held in the edifice now, to which Mr. Adye replied that the building was regarded rather as an interesting relic, and it was so near the Parish Church that there was no necessity for service there. He, however, gave his archæological congregation a capital "sermon in stones," and observed that though the trustees had to keep the Saxon Church in repair, yet contributions forthcoming left some profit. While the party were viewing

#### THE EXTERIOR FEATURES

he called attention to the fact that although the structure was small, yet it was striking on account of the height. When first discovered by Canon Jones the Church was used as a school, and there was a master's house built on one part, while a large stable hid the Architectural features. On the east side was an old house covered with ivy, which hid the Church from view. Inside, the nave was divided into rooms for the school, and the chancel formed a labourer's cottage—to such base use did it become. On obtaining possession the trustees took down the modern buildings, lowered the ground, and removed the partitions and doors, and exposed the original work. They replaced missing portions of the old work, but did not remove a single stone of the original structure. In taking down the chimney stack erected between the chancel and the nave all the stones of the arch, except one, were discovered. Canon Jones found out the Church through directing his attention to the building as he gazed on it from a hill in the locality. He believed that there were a nave and a chancel, and this was the first intimation of the original structure. The interior had been so altered that no one could have recognised it as built for ecclesiastical purposes.—The Parish Church, which is dedicated to the Holy Trinity, was next visited, under the guidance of Mr. Adye. It is a noble structure, though opinions differ as to the

#### VALUE OF THE RESTORATION

carried out by Messrs. Manners and Gill, of Bath, in 1866. The original Church was built in the twelfth century, and in the fourteenth century the chancel was lengthened by about 16ft., and it is now 48ft. long from east to west. The nave was formerly separated from the chancel by an oak screen and a wood loft, and the screen must have been richly coloured, to judge from the remains. Some of the monuments are interesting, there being some in connection with the families of Tugwell, Clutterbuck, Hobhouse, Gaysford, and Bethell. There is a tablet to the memory of Lieutenant-Colonel H. S. Shrapnel, inventor of the Shrapnel shell, who lived at Midway Manor, in the parish, died in 1849, and his remains were interred underneath the chancel, the spot being indicated by a brass. One fine Architectural feature in the Church is a magnificent fourteenth century window in the chancel.—Barton Farm was visited specially to see the spacious tithe barn, which was erected either towards the

#### END OF THE FOURTEENTH

or at the commencement of the fifteenth century. It was the tithe barn of the Abbots of Shaftesbury, and is 170ft. long and 20ft. wide. There are four porches, viz., two on the north and two on the south side. The farmhouse contains some remains of the original building, the date about the same as that of the barn, and this might have been the residence of the agent of the Abbot. As to the barn, it is the largest structure of the kind in the West of England. An apartment in the farmhouse had special attraction for the archæologists, it being a room over the gateway, and probably used for entertainments, since there is a minstrels' gallery.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
August 4th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

"ANYONE can paint a picture," a famous French Artist once told his pupils, "but genius is required to sell it." English painters, to judge by the sales at the Academy, are not bountifully gifted with the kind of genius necessary to enable them to dispose of their pictures. The middle of July has passed, and in a few days' time the Exhibition will close, yet only a small proportion of the two thousand and odd works of Art at Burlington House have changed hands. A few more purchases may yet be effected at absurdly low prices—for this is the time when the crafty bargain-hunter tempts the disheartened Artist with an offer of £20 for a hundred-guinea picture—but to all intents and purposes the legitimate sale season at the Academy is at an end. So far, up to July 15th, 180 pictures and other works have been sold at Burlington House, the sum total realised being £16,084 15s. This amount compares favourably with last year, when the sales were exceptionally bad, or with 1893, when they amounted only to £13,319. Some few years earlier, however, things were far better, for in 1888, 284 works were disposed of at the Academy, the amount realised being no less than £21,599.

ONE of the most striking facts in connection with the sales at the Academy of 1897 is the curiously unequal manner in which the sum total of £16,384 15s. is divided among the sixteen rooms at Burlington House. For example, in the First Gallery, pictures to the value of £1395 16s. have found purchasers, yet in the Second Gallery, where the chances of selling are supposed to be really good, the sales amount only to £603 10s. The pictures which have fetched the best prices in these two rooms are Mr. H. J. Draper's "Calypso's Isle" (£315), Mr. La Thangue's "Summer Morning" (£300), and Mr. Ernest Waterlow's landscape, "A Tranquil Stream" (£400). In the Third Gallery—the room of honour at the Academy—the sales amount to £4171 15s. Here twelve pictures have been sold, including Mr. Napier Hemy's "Pilchards" (£1200), purchased by the Chantrey Trustees, Mr. G. H. Boughton's "After Midnight Mass" (£1200), and the veteran Mr. Sidney Cooper's "Brae of Balquhiddy" (£600). Six pictures have found purchasers in the Fourth Gallery, where the total of £989 12s. includes the sum of £525 paid by the Chantrey Trustees for the picture by Miss Kemp-Welch, "Colt Hunting in the New Forest." In the Fifth Gallery the sale total rises to £1762 10s., including £1000 for Mr. La Thangue's "Harvesters," and £500 for Mr. J. C. Dollman's "St. Anthony," while in the Sixth Gallery the amount is even higher, reaching as it does £1933. The principal sales in this room are Mr. Blair Leighton's "In time of Peril" (£600), and Mr. E. Holyoake's "Madame Roland on her Way to Execution."

THERE are several miscellaneous statements of some interest in Dr. Collins' annual address. It is not perhaps surprising, but it is a very remarkable fact that in the administration of

the Building Act, the Council have had to deal with no less than 4032 dangerous structures during the last year, which does not, of course, include any temporary erections in connection with the Jubilee commemoration. The number of sky-signs—which are certainly dangerous as well as ugly structures, though they are not included in the figures given—is rapidly diminishing under the Act of 1891. Of the 120 that remain licensed for a third extension of a period of two years, the majority must be removed before the close of this year. It is something to be thankful for that the erection of "sky-signs" was stopped so promptly. It is appalling to think how London, which is none too beautiful as it is, would have been disfigured if the Act had not been passed.

THE opening of the Hotel Burlington at Dover, on Saturday, adds one more to the many important improvements which are taking place at the old Cinque Ports town. The hotel is situated opposite the Promenade Pier in the centre of Dover Bay, and commands a sweep of the Channel, with the Castle and cliffs on the east and Shakespeare's Cliff on the west. It has 380 rooms, all of which have a good outlook. Messrs. Maple and Company, of Tottenham Court Road, have carried out the furnishing and decoration, which is in the Georgian style. The hotel is luxuriously furnished throughout, and possesses all modern improvements in the way of lighting, heating, and sanitation. It has a very commodious lounge and ball room furnished and decorated in Oriental style. The furnishing alone has entailed an expenditure of nearly £7000. The hotel was declared open by Mr. Henniker Heaton, M.P. for Canterbury. In the course of his remarks he congratulated the Government on the fact that it had induced the House of Commons to spend three and a half millions on the construction of an immense national harbour at Dover. The details of the plans, he said, had not been publicly announced, but it was understood that the harbour would be the largest and most important on the British coasts.—An article on the subject appears in this issue.

SUBURBAN theatres of London are increasing rapidly. There is the Grand being erected at Fulham, the Coronet at Notting Hill Gate, the Broadway at Deptford, the Alexandra at Stoke Newington Road, the Royal County at Kingston, and the Albert at Tottenham. The Standard at Shoreditch is under process of entire reconstruction, so as to bring it in line with the requirements of the times, and on the 27th ult. was opened at Crouch End the Queen's Opera House. The house at Crouch End will furnish accommodation for 1500 people, and there is a stage 54ft. in width, supplied with an iron fireproof curtain. Proper precautions, approved by the authorities, have been taken to reduce the risk from fire, and it may be laid down as a general principle that the London County Council is entitled to the thanks of its constituents for having kept a sharp eye on this department of public safety in the theatres of London. The ceiling of the new house has been tastefully ornamented, and the orchestra is sunk below the level of the auditorium, so that the audience on the floor are not distracted or their view impeded by the instrumentalists. The stalls are comfortably fitted, and the dress circle occupies the front seats of the balcony, the upper circle being behind. There is a roomy pit to hold about 400, and the approaches and exits of the building appear to be of a satisfactory character. Provision has been made whereby the house can be adapted for other purposes.

PUBLIC opinion in Holland is at this moment much moved by the sale of three important pictures from the famous Six Collection, the last survivors of those which were formed during the lifetime of the great painters of the seventeenth century. Every art-loving visitor to Amsterdam knows the house where hang Rembrandt's magnificent "Burgomaster Six," and, perhaps, a hundred other pictures of the highest class. Innumerable attempts

have been made at various times to induce the family to sell, but till now without success. At last they have yielded so far as to cede, fortunately not the Rembrandt's, but three others—Cuypp's "View on the Maas," the Terburg, and the Gerard Dou. These have lately been sold, after long negotiations, for a prodigious price.

SIR E. J. POYNTER, in the new preface to his "Lectures on Art," warns young students against the "strange tendency of the day among a certain class of painters to neglect the study of form in favour of so-called impressions hastily and more or less dexterously thrown on canvas." He continues, "when a clique of self-styled 'Impressionists' and their apologists in the Press are only too ready to absolve them for incompetency in drawing and slovenliness of execution—nay, rather to applaud them for their sins in this respect as indicative of a higher form of genius—they may, and often do, imagine themselves ready to set forth on their career as fully equipped Artists before they have acquired even the necessary rudiments of instruction. If the student will take the trouble to understand the work of Michael Angelo, or, indeed, of any of the great Italian masters of Design, he will find their 'impressions' of life and nature to be not less vivid than those of any modern painter, and executed with a command of the resources of Art which has almost passed out of knowledge."

THE proposal of the London County Council to seek powers next year for establishing and working river steamboat piers will certainly meet with very general approval. We have now, it is true, a service of steamboats running, but it is impossible that any such service can be satisfactory till we get an entirely new system of piers. Between Hammersmith and Woolwich there are twenty piers on the north side of the river and thirteen on the south. They are many of them badly placed, difficult of access, and very poor in character, while their maintenance costs considerably more than they can be made to yield in tolls. If the County Council gets the power, it will probably affect an entire reform, and among other changes may be expected to establish piers in the middle of the stream at the bridges. It would be an important point with the Council, too, to establish quick and easy communication between the north and south banks. The Council has obtained a deal of evidence as to what ought to be done, and has sketched out a very carefully thought-out scheme.

THERE was another alarm at Quarry Bank on Saturday week owing to the fall of the gable end of a factory which had previously been in great part cracked and demolished by the subsidence of the surface. Beyond this, however, some of the residents were much perturbed by the imperative advice of Lord Dudley's mining engineer not to sleep on the premises they now occupy. Shots are heard at intervals both by night and by day from the shallow mines below, and they cause distinct and alarming vibrations in the houses and their contents. A club-room on Mr. Tranter's premises has been split and gapes open to the sky—one of many indications that there is only too good ground for the urgent advice to the occupiers not to sleep again on the premises. A school near the spot which has become endangered has been propped to allow of its use being continued for the present, and signs of the movement and dislocation of the surface are to be seen in many places.

THE Post Office Sites Bill, as amended by the Select Committee, has just been issued. As originally introduced by Mr. Hanbury and Mr. Akers-Douglas, the Bill proposed that certain disused burial-grounds attached to the parishes of Christ Church, Newgate Street, St. Botolph Without, Aldersgate, and St. Leonard, Foster Lane, generally known as the Postmen's Park, should be maintained as a public garden, and that for that purpose the Postmaster-General should pay to the London Parochial Trustees the sum of £100 per annum,

and the said trustees should pay to the Vicar and churchwardens the sum of £200 per annum so long as the public garden was maintained in good order. The London Parochial Trustees have power to build upon or lease for building purposes a plot of land lying between the garden and Little Britain, and as the garden was largely used by the employees of the Post Office, and would be seriously injured if the Little Britain land should be built upon, the Vicar and churchwardens, in consideration of the same being maintained as an open space and part of the said public garden, agreed to assign to the Postmaster-General the £200 per annum payable to them by the London Parochial Trustees. This portion of the Bill was struck out by the Select Committee, and the Bill now simply provides for the acquisition of lands by the Post Office in London, Brighton, Norwich, Plymouth, Southampton, Oban, and Cork. There is a special proviso, for the protection of the London and South-Western Railway Company, that in case the Postmaster-General should at any time abandon a part of the land at Southampton he should offer it to the South-Western Company.

An interesting series of water-colour drawings has just come into the possession of the Carnavalet Museum in Paris. The drawings consist of a number of portraits of prominent persons belonging to the court of Napoleon III., who are represented in the costumes they wore at fancy dress balls and when figuring in tableaux vivants. The Empress Eugénie is shown as a Bohemian Girl, the Marquise de Gallifet as an angel, the Comtesse Walewska as Diana, the Princesse de Metternich as a demon, the Comtesse de Pourtales as an Indian dancing girl, and Mme. de Gortschakoff as Salammbo. The collection also includes a photograph of the Emperor, Empress, and Prince Imperial taken on a small yacht on the lake of Fontainebleau.

On Saturday prizes were awarded to lady students in the thirty-seventh session of the Crystal Palace School of Art, the judges being Mr. J. B. Burgess, R.A., Mr. Basil Bradley, R.W.S., and Mr. E. Roscoe Mullins. The competing works denoted good instruction. For this Mr. H. A. Bone is responsible in painting, drawing and modelling from life; Mr. J. Scott, R.I., for painting from costumed figure; and Mr. S. J. Hodson, R.W.S., for the sections of Architecture, landscape, flowers, and animals from life. Animal drawing is particularly good as regards time sketches and in the painting of heads, but weakness made itself apparent when the whole of the beast is treated. The student esteemed the best, and who received the scholarship in Art, is Nina Rothney, certainly the most accomplished, winning the silver medal for a full-length back view in oils from the life, commendation for a ten minutes' time sketch, and a certificate for an excellent drawing of the Parthenon "Fates." For illustrative design, Winnie Hunt was certificated for a clever clay sketch of "Good News from Ghent"; and for applied design, Dorothy Selous had like award for an upright panel of lusted gesso with figure and foliage design. A plaster statuette from life of a man reading, rightly gained a certificate for Winnie Hunt. In drawing from life, A. Margaret Page took the silver medal for a full-length of a man less than life size, drawn accurately and with spirit, and a half-length from the same model, drawn on a larger scale, evoked commendation from the judges for M. Josephine Streatfield. The best of the water-colour drawings of animals was the head of a white horse, by Ada Furneaux; and in Architecture, E. A. Holdsworth won the silver medal for a water-colour drawing of the Alhambra Courts, while two more of Mr. Hodson's pupils (Marion Fox, with a bronze statue against carved walls, and Gwyndd M. Hudson, with crimson tulips) were commended. Miss Hudson was likewise certificated in Mr. Scott's class for the water-colour drawing of a monk scouring a pewter dish. Exhibits from members of the sketching club prove that this school of Art is not one of those whose results rest only on studio work.

A NEW Church at Balholm Sogne Fjord, Norway, recently dedicated, has a special architectural interest as being built on the model of the Stave-kirke or ancient wooden churches of Norway, which are quite unique among ecclesiastical buildings in Europe. It is the first Church built in that style since the thirteenth century, but travellers in Norway will remember the curious specimens which remain at Borgund, Eidsborg, Vik, and other places.

THE construction of the City and Waterloo line seems to have been a very successful piece of work so far as it has gone, which is very near to completion. According to the Act authorising the railway, another twelvemonth might be taken for the work. There is good reason to hope that it may be in working order by the end of the present year. The two terminal stations are being made, and the rails are being laid down, together with the electrical conductors, while the installation at Waterloo is being rapidly proceeded with. With the station underneath Waterloo considerable advance has been made, and so far as that, and, indeed, all other portions of the undertaking itself are concerned, another six months will, it is believed, be ample time for completion. There may, however, possibly be some delay over the connection of the line with the circular subway in front of the Royal Exchange. An incline is to run down from this to the City terminus of the Waterloo line, and in the way of this connecting slope there is a great tangle of all sorts of pipes and drains and sewers, and some of these, at least, will have to be diverted and reconstructed. That may prove a long and troublesome business, but nothing else seems likely to stand in the way of the opening of the new line by the end of the present year.

A RAILWAY or tramway running up and down the precipitous face of the Devil's Dyke, near Brighton, was opened on Saturday. There are already established at the highest point of the Dyke an aerial railway running from hill-top to hill-top, and a number of other contrivances, in which the excursionist appears to take delight, for securing locomotion under novel conditions. The steep-grade railway, however, claims some amount of utility, in affording rapid communication between the Brighton Railway Company's branch terminus, at the head of the Dyke, and the villages lying in the plain at the foot of the Dyke hills. It is of the same type as the cliff railways at Scarborough and elsewhere, although the engineer, Mr. C. O. Blaber, has introduced some new features in the details of construction. The whole length of the line is 840ft., the "lift" being 395ft. From the top there is a run of 240ft. at a gradient of 1 in 1.8, the second and steepest part being 1 in 1.5, and the last and lowest gradient 1 in 2.9. The vertical curves between the different gradients have about 1000ft. radius. There being a scarcity of water as well as of solid fuel at the head of the Dyke, the hauling power is obtained from a Hornsby-Ackroyd oil engine. The haulage ropes are two 2in. steel wire cables, and the cars, each seating fourteen persons, are fitted with powerful brakes, by which a car running down hill would be promptly stopped before any great momentum had been obtained. The brakes are also designed to prevent the cars from leaving the track. There is a powerful brake on the shaft of the main hauling pulley, worked by a foot lever, as well as from the platform. Spring buffers are provided at the lower end of the line, but there is an obvious need of buffers also at the top.

THE Church of St. Michael, Wood Street, the site of which, as previously announced, has just been sold by auction, stands at the corner of Wood Street and Huggin Lane, and occupies an area of 3700 superficial feet. The Church was one of the buildings destroyed by the Great Fire, and was re-built by Sir Christopher Wren, who completed it in 1675. It is by no means a handsome structure, and its warmest admirer would not feel justified in

calling it a masterpiece of the great Architect. Possibly Wren, under the pressure of business, left the design to one of his assistants, or, perhaps, he followed the wishes of those who employed him, and made the structure as plain as possible—it was erected at a cost of £2600. The Church has been already dismantled, and is now a mere shell.

IN Old St. Pancras Gardens, once a churchyard, three notable glee writers—Samuel Webbe, John Danby, and Stephen Paxton—were buried. Webbe's gravestone cannot be discovered, so a granite obelisk has been erected in its stead, and the weather-worn memorials of Danby and Paxton have been restored. The three were unveiled by Mr. George Risley a day or two ago.

GENERAL satisfaction will be felt at the action of the County Council in sending back that part of the report of the Highways Committee which dealt with the lighting of the Embankment. While it is highly desirable that this great and handsome thoroughfare should be made more useful and attractive to the public at eventide by electric illumination, it would be a great pity to disfigure the promenade by a tall chimney close to Charing Cross terminus. The proposal was to construct a generating station at that point. This would have entailed the erection of a high and smoky shaft, which must have proved a blot on the scene. We have enough of tall chimneys on the south bank of the Thames, and can well afford to dispense with their presence on the north side. It would be much better even to suffer some waste of electric power by placing the station either near the Surrey end of one of the bridges or in some side street, rather than have it abutting on the frontage of the Embankment.

A WORK of great importance has been undertaken by the London County Council—a register of historic buildings in the metropolis. So far as the parishes of Bow, Poplar, and Bromley are concerned, the particulars have been completed by the Committee for the Survey and Registration of Old Memorials of Greater London. The information is the result of a complete survey of these parishes, and an account is given of each building which has historic or architectural interest. Similar records are to be prepared for other parts of London, and it is intended to print the collection as a valuable memorial of the metropolis and a warning against any contemplated act of vandalism. As a beginning, the General Purposes Committee asks authority to expend £100 in putting the existing manuscript into type.

THE astonishing revelations which are made at the meetings of the Select Committee on the Museums of the Science and Art Department follow one another with such rapidity that something like a weekly commentary is necessary to keep pace with the discoveries of the investigators. There seems from the evidence given lately to have been a great deal of manipulation of the official records; and the apparent unwillingness of Sir John Donnelly to produce a report of the objects acquired for the collection, and subsequently withdrawn because their authenticity was questionable, must be reckoned among the most significant of the admissions that the directors of the South Kensington Museum have been forced to make. An equally suggestive deficiency was the absence from the list of "breakages, &c.," of any statement of the losses to the collection caused by the fire in the Indian section. This omission, taken in conjunction with the cheerful indifference of the official staff to the risks which are now proved constantly to threaten the building, has a very unpleasant aspect. Another most objectionable feature is the manner in which the needs of the Art Library are treated by Sir John Donnelly. His opinion about this most important section is worth attention, for it helps to explain some of the inconveniences to which students are exposed in the Library. He is said to consider that it should only be

a catalogue of the museum itself; and doubtless on this plea he would justify the ridiculous inadequacy of the book collection, and the absence of a very great number of Art publications which are absolutely necessary for the proper investigation of points of Art history.

COMPLAINTS have often been heard that the great English school of painting is badly represented in the Louvre Museum. There are in the room devoted to British Artists a few good Constables, a Raeburn, and more or less interesting products of the brushes of Lawrence and Gainsborough. To these were adjoined a series of water-colours by Bonington; but a good deal will have to be done before the collection can be deemed representative. Lately the conservator for paintings, M. Lafenestre, added to the collection a Romney, for which he paid £360, or 9000f. It represents Sir John Stanley, a knight of the olden time, and does not satisfy critics. Romney, however, has got his place in the Louvre, and it is satisfactory at least to find that an attempt has been made to increase the number of English works of Art in the famous French National Gallery.

THE first day's sale of the first portion of Captain F. Brinkley's well-known and extensive collection of porcelain was held on the 27th ult. by Messrs. Christie, Manson, and Woods, and showed a total of between £600 and £700 for 156 lots. The principal articles included the following in Old Nankin: an inverted pear-shaped jar and cover, painted with branches of prunus, 17in. high, and another, 17½in., 23 guineas; a pair of inverted pear-shaped jars and covers, with branches of flowering prunus, 14in. high, £11; an oviform jar, with plum pattern on a marble ground, 9in. high, £14 10s.; and an oviform plum-pattern jar and cover, 9½in. high, £14 10s. The principal articles in Chinese whole-coloured porcelain included a globular bottle, with powdered-red decoration, 20in. high, £19; a turquoise crackle beaker vase, with raised ridges and leaf ornament in low relief, 13½in. high, 10 guineas; a double gourd-shaped splashed fleur-de-pêche crimson and green crackle bottle, 8in. high, £12 10s.; a small brilliant coral-coloured bottle, 6in. high, and a slender fleur-de-pêche vase, 6½in. high, £16 10s.; a jar, coffee-coloured ground, with flakes of dark green celadon crackle, 7in. high, and a small jar, of pale brown dusted with silver, 5ins. high, £14 3s.; a slender vase of splashed sang-de-boeuf crackle, graduating from pale fleur-de-pêche, 17 ins. high, and another nearly similar, 16½in. high, the two, 46 guineas; and an oviform jar, with open lip pierced with small scroll design under the glaze, 8½in. high, £12. The old Chinese enamelled porcelain included a vase, with small neck, enamelled with a flowering tree, and two other vases, 17 guineas; an oviform famille verte jar, enamelled with floral decoration, 9½in. high, 27 guineas; and a pair of vases and covers, with fish in red and white, and aquatic plants in gold on a dark blue ground, 13in. high, 22 guineas.

IN the lecture theatre of the South Kensington Museum, Sir Wyke Bayliss distributed the medals and prizes gained by the students of the Royal College of Art. The report showed that the students had been successful in carrying off 6 gold, 89 silver, and 126 bronze medals, 314 national competition books, 72 Queen's prizes, and 26 art master's certificates. During the year four students in training had been appointed to masterships of schools of Art. The gold medal for the Travelling Studentship had been awarded to Mr. S. Thorogood, the silver medal to Miss F. H. Steele, and the bronze medal to Miss J. M. Twiss. Sir Wyke Bayliss, addressing the students prior to distributing the prizes, said it was for them to fulfil all that their fathers had failed to accomplish in the field of Art—to make the old paths broader and safer, and to discover new ones. The Artist of to-day had two things to fight against—despondency and conceit. The true Artist was always trying and always failing, for beyond his

highest achievements there always lay a still higher aspiration. Art was a living and a growing force. They need have no fear of heresy among their ranks, for its effect was in the end purifying. Finally, he exhorted them to study the accumulated knowledge of the centuries, and to base their own knowledge upon a personal study of Art.

THREE new pictures for presentation to the Royal Exchange are being painted by Messrs. Solomon J. Solomon, Ernest Crofts, and Seymour Lucas. The first-named Artist has nearly completed his work, which portrays "King Charles I. coming to the Guildhall to Disarm the Five Rebellious Members." This picture, which is nearly 17ft. high, is the gift of Sir Samuel Montagu, M.P., the well-known banker. The second picture represents "Queen Elizabeth Opening the Royal Exchange," and is the gift of the Mercers' Company; while the third painting of Mr. Seymour Lucas depicts "William the Conqueror granting the Charter to the Citizens of London," and is presented by the City of London.

THE contents of Hengrave Hall, to be sold by Messrs. Hampton and Sons to-morrow and seven following days, have been collected during two centuries by members of the Kytson and Gage families. The works of Art include examples of Holbein, Van Dyck, Sir Peter Lely, Sir G. Kneller, Van Loo, Baptiste, Keyser, and Teniers. A clock which belonged to James II., a couple of Cardinal Wolsey's chairs, an embroidered shirt that belonged to Henry VII., and some old manuscripts are catalogued.

THE London County Council held its last meeting prior to the recess on the 27th ult. With regard to the evidence to be laid before the Water Commissioners, Lord Onslow stated the Moderate party would not further discuss this measure, but enter their protest against the recommendations and record their votes. The committee's proposals, which practically went through without debate, are to the following effect: (1) That the water supply should not be in private hands. (2) That the undertakings of the companies should be forthwith purchased at their fair and reasonable value, regard being held to special circumstances, rights, and obligations. (3) That the management should, with limitations, be effected by the Council. (4) That the Council should, in the first instance, be the purchasing authority. And (5) that if the undertakings are not acquired, more effective powers of control should be given to the Council, and that the position of the companies should be reconsidered and the law amended.—The Council agreed to contribute £15,500 towards the cost of the acquisition of a piece of land covering nearly twenty acres next the river, near Putney Bridge, for the purposes of an open space. Discussion arose over the question of entrusting work to the Works Department, owing to certain recommendations of the committee in charge of housing schemes. Lord Onslow explained that the Moderates did not wish to deprive the Department of work, but they would do their best to prevent any work going to the Department which could not be finished by March, when the electors would have an opportunity of expressing their opinions. In the end the committee's recommendations were carried, the amendments in favour of inviting tenders being rejected.

THE Vicar of Swansea writes:—"May I through your columns make known to all who are interested in the completion of the Parish Church, that the building committee has made preparation to go on with Stage II. (of the chancel, tower and vestries) at once; and that the considerable loss, which would be incurred by stopping the work, now will, it is hoped, be avoided. In order to go on without a break in the re-building, £2000 is required immediately, in order to complete the £3000 which the Chancellor of the Diocese requires to be in hand before he signs the permission to take down the old chancel."

## Professional Items.

ABERDEEN.—The new Church, which is almost ready for occupation, will be ranked as one of the largest Churches in the North. The building, which was designed by Mr. Stanniforth, Edinburgh, is of Early English Architecture of the transition period. It is cruciform in plan, with additional side gables, giving height for large three-light windows over the side doorways. The tower is 100ft. in height, and in it is the main entrance, which is divided with a shaft in the centre, and ornamented with elaborate carving. The design also includes a commodious hall, without which no Church now-a-days can be said to be complete. The cost of the Church is £8000, but the hall will make the total cost considerably over that sum. Contrasted with the old Church on the river side, it exhibits a remarkable advance from an Architectural point of view, for it would be difficult to find a plainer building than the box-looking structure which the heritors erected for a Parish Church in 1810. The contrast distinctly shows the progress of Nairn from a fishing village to a fashionable watering-place; and also the national renaissance in Ecclesiastical Architecture. The new Church will accommodate 1200 persons. The roof is semi-open, and an oval arch behind the pulpit will contain the organ.

The latest product of the growing taste for imposing granite fronts and doorways for public and commercial buildings is a doorway now completed by Mr. Boddie. It is a striking piece of work, calculated to show effectively the high Architectural merit of Aberdeen polished granite. The doorway, except for the bases of the pilasters, which are in Dyce grey, is constructed of Peterhead red granite. It stands 20ft. high from the ground level, and the doorway space is 13ft. 10in. high by 6ft. 3in. wide. Standing, as already indicated, on grey moulded bases, the flanking pilasters rise with massive front and heavily moulded in-goes to the trusses. The doorway is of fine and uniform colour, and is to be erected in Cannon Street, London.

A meeting of the Finance Committee of the Town Council was held last week, for the purpose of considering the question of the city Architectship. The matter has been for some time under discussion. The resignation of Mr. Lynham has created a vacancy in the Surveyor's staff, and, although no finding has been come to on this matter, the feeling of the meeting was in favour of mature consideration as to the whole arrangements for carrying on the work of the department. As to the city Architectship, the Committee, whilst deferring a final decision, practically agreed to establish a separate department for the discharge of all the Architectural work failing to be performed under the present arrangement with Mr. Rust. The official to be appointed to take charge of the work would be solely the servant of the Council. The whole question was thereupon adjourned for reconsideration to a meeting to be held on August 13th.

BARNESLEY.—At the meeting of the Barnesley Board of Guardians on the 27th inst., Mr. E. Batley in the chair, discussion took place with reference to the proposed new imbecile wards. Mr. Richmond made a proposition rescinding the resolution adopting the plans and estimates. Mr. Littlewood seconded. The Rev. E. J. Saxton referred to the recent decision of the West Riding County Council to provide accommodation for all classes of imbeciles, and he pointed out that if the Board built the new wards it would also have to pay to the general scheme. The proposition was carried.

BIRKENHEAD.—The foundation-stone of a Liberal club which is being erected in Duke Street, Birkenhead, was laid a few days since. The building will contain an assembly room on the first floor, capable of accommodating 400 people, while on the ground floor there will be a smoke-room, billiard-room, committee-room, &c. The Architect is Mr. T. Taliesen Rees,

and the contract is being carried out by Mr. George Snape.

**BLACKHEATH.**—The foundation-stone of new schools, which are being erected at Gorsty Hill, by the firm of Messrs. Lloyd and Lloyd, Coombs Wood Tube Works, was laid a few days ago. The schools, which will be so constructed that they can be used as a Mission Church, are in connection with St. Paul's parish, Blackheath. Messrs. Prothero and Phillpott, of Cheltenham, are the Architects. It is expected that the building will be completed about March next.

**BLACKHILL.**—On Saturday week the new Primitive Methodist Church and schools in Park Road, Blackhill, were opened by the Mayor of Newcastle. The total cost of the building (exclusive of the site), is about £3000, about £2000 of which has already been raised. The premises are erected at the foot of Park Road, and the exterior presents a very handsome appearance, the front of the buildings overlooking the Park. The Church, which will seat 600 people, measures 67ft. long by 43ft. wide, its height from floor to ceiling being 31ft. In the schoolroom adjoining there is provision for 400 children. The designs were prepared by Mr. George Race, C.S., of Westgate, Weardale, and the work carried out under his supervision. Mr. Wm. Whitfield, of Elm Park, Medomsley, was the main contractor; the joiner work was done by Mr. Race; plumbing, Mr. L. Unwin, Shotley Bridge; painting, &c., Mr. Surtees Leslie, Shotley Bridge; and the plastering, cementing, &c., Mr. David Ormerod, Blackhill.

**BLACKPOOL.**—The Architect's report on the condition of the tower and buildings after the recent outbreak of fire states that no damage has been done to the main structure or entertainment portion of the buildings, the fire having been confined to the three landings above the 380ft. platform, where certain wood-work has been destroyed, and where the heat fused the cables, causing the two balance weights to fall. There is not the slightest need for fear, as the tower and buildings are in as stable a condition as when they were built.

**BOOTON.**—It has been decided to erect new Wesleyan Sunday Schools, with class-rooms, reading-room, and central hall for public meetings, at a cost of £2000. Messrs. Gelder and Kitchin, of Hull, are the Architects.

**CARDIFF.**—At a recent meeting of the Cardiff Town Hall Committee, a letter was read from Mr. Alfred Waterhouse, R.A., expressing his willingness to act as Architectural assessor in the competition for designs for the new Town Hall on being paid a fee of 300 guineas. Mr. Waterhouse suggested that it was undesirable that the proposed five per cent. commission to be received by the successful competitor should include travelling expenses. Every inducement, he said, should be afforded to the Architect to devote as much time as possible for personal supervision of the building operations, and nothing should be done to handicap the ablest Architects obtainable in the country. —It was resolved, on the motion of Mr. Robinson, seconded by Mr. Buist, that Mr. Waterhouse's services be accepted at the remuneration named by him. —The committee also accepted Mr. Waterhouse's suggestion that the successful Architect's commission of five per cent. should not include travelling expenses. Mr. Waterhouse also stated that the time for receiving designs should be extended, and the committee resolved that the plans should be in by December 4th, instead of October 31st, as previously proposed.

**CHESTERFIELD.**—At the monthly meeting of the School Board the Chairman read the report received from the Architect to the Education Department respecting the 21 sets of competitive plans for a new school to be constructed in Durrant Road, which had been submitted to the Department. The report stated that the estimates ranged from £4500 to £15,000. The former was as inadequate as

the latter was extravagant, and the Architect to the Department did not consider that any one of the plans represented a building which the Board could regard as satisfactory if carried out. He considered the plan sent in from Houston and Houston, London, to be the best of those submitted, and he placed Hall, Cooper, and Davis, Scarborough, as the second best. It was decided that the premiums of £20 and £10 respectively offered for the first and second best sets of the plans submitted should be paid to these firms.

**COLCHESTER.**—Lexden Church, Colchester, was re-opened on Sunday week after the renovation of the nave. Some time ago a new chancel was built, and in order to make the interior of the building as harmonious as possible, the work of re-seating and decorating the nave, as well as lowering and relaying the flooring, was a short time since entrusted to Mr. E. Beaumont, of Lexden. The nave is now seated with oak pews, the ends of which, abutting on the aisles, are chastely carved in patterns copied from standard antique examples, and the whole floor of the nave has been lowered 6in. and laid with wood blocks. The side aisles, which are also a new feature, and the back of the Church, as well as the porch, have now been floored with red and black tiles. The wooden panelling which forms a dado at the sides of the nave has been decorated with a quiet ecclesiastical pattern. To the font have been added a handsome base, floor, and steps, in various rich marbles. Carved stone, supporting figures of angels, has been added to the chancel arches, as well as some other carving.

**CORK.**—A new Church built in connection with St. Vincent's Convent, Sisters of Charity, St. Mary's Road, was dedicated a few days ago. The Church, which is of the early style of English Architecture, comprises nave, aisles, and side chapels, and two sacristies. The total length is 75ft. by 52ft. An arcade dividing the nave from the aisles is supported by highly polished pillars of red granite, having ornamental caps and moulded bases of Portland stone, and it is richly decorated; height from floor to ceiling, 45ft. The sanctuary is laid with marble mosaic, richly coloured, and the high altar is richly carved. The work has been carried out by Messrs. E. and P. O'Flynn, builders, Cork, from the designs of Mr. W. H. Byrne, Architect, 24, Suffolk Street, Dublin.

**EDINBURGH.**—A new memorial Church is being erected in Edinburgh. The Church is of the truncated cross form, the end of the longer arm pointing to the Ayr Road. The elevation has a central high-pointed gable finished with an ornamental cross, with a buttressed tower surmounted by a spire on one side and a smaller gable relieved by buttresses terminating in ornamental pinnacles on the other side. The main entrance door is in the centre of the front gable, and will be approached by a flight of steps. It will have on either side lancet-headed windows for lighting the corridor. The front gable is pierced by two two-light large windows filled with arched tracery, while above these is a large circular window with moulded flowing tracery. The tower and spire rise to a height of 140 feet, and the angle buttresses of tower terminate in moulded pinnacles with finials and carved crockets. The side elevations will be pierced by large four-light and three-light windows filled with mullions and tracery work. The style of Architecture adopted is the decorated or ornamental Gothic, and the flowing window tracery partakes somewhat of the Flamboyant style. Internally the Church will have a front entrance corridor 8½ft. wide, at one end of which is placed the session-room, with classroom above, while the tower at the other end contains the gallery stair, with side entrance door. The nave will be 44ft. wide and the transepts 52ft., with a length from front corridor to back wall of apse of 68ft. The back wall will be broken up by an opening 27ft. wide, beyond which will be placed a raised platform containing the pulpit and elders' seat; and still farther back there is to be

an apse, which will provide accommodation for organ and choir. The Church will be seated for about 500. Behind the Church there will be a hall which will hold 150, and the minister's vestry. The roof of the Church will be lined with pitch pine, and will be open to the collar beam, and the pews will also be of pitch pine, with moulded ornamental ends. The Church and hall, &c., will be heated by hot-water pipes, and will be ventilated at the ridge. The Architect for the buildings is Mr. D. Menzies, York Place, Edinburgh. The contractors are all local firms, Mr. Richmond being the builder.

**FALMOUTH.**—The Falmouth Town Council recently met to consider the embankment and the extension of Market Strand pier, according to a plan proposed by the borough surveyor, at an estimated cost of £3900. Dr. Banks proposed that the scheme be approved. —Mr. F. J. Bowles, seconding, remarked that the embankment scheme was about eighty years old. This was the most sensible scheme that had ever been before the Council. —Mr. Liddicoat objected to the proposal because it did not extend to Fish Strand. —The motion was carried.

**HEELEY.**—The laying of the memorial stones of the new Church for St. Peter's Mission took place a few days ago. The Church, beneath which there will be a school, will in design be a mixture of Tudor and Gothic. Mr. J. W. Gillott is the Architect, and Mr. J. D. Cook the contractor. The Church will accommodate 800, and the schools about 1000. Including the cost of demolishing the old buildings, the purchasing of the new site, and the renovation of the organ, the scheme represents an outlay of £2200, towards which about £1000 has been secured. The school will be occupied about September, and the chapel will be completed as soon after as possible.

**KILLIN, PERTSHIRE.**—The Sewage and Sewage Disposal Works which have been in construction during a year past are now completed. The town has been re-sewered throughout, and these are provided with man-holes, flushing tanks, and all the most recent improvements in sanitary practice. The sewage is treated by the "International" process, and the installation is erected in the park land owned by Lord Breadalbane, and situated south of the Killin Railway. The sewers are designed to deliver their contents by gravitation only, and every advantage has been taken of the ground for this purpose. The effluent passes in an open concrete channel into outfall pipes leading below the grazing land into Loch Tay. Great satisfaction is felt at the successful result of these works, which are the first of their kind in the West of Scotland. The construction and design is of a model character. The tank is of brick, and fitted with Candy's sludge-lifting apparatus, and the various treatment chambers and the filter cases are constructed of concrete. The completion was commemorated by a ceremonial on Friday last, when the Works were formally declared open by the Convener of the County, Colonel Hope Drummond. The whole scheme has been designed and carried out by Mr. Woulf Brennan, C.E., of Oban, whose plans were preferentially selected by the District Committee of the County Council. The contractor was Mr. Bremner, of Fortingall, Aberfeldy, and Mr. R. Cameron, of Edinburgh, was the Clerk of Works.

**LEEDS.**—The Streets and Sewerage Committee of the Leeds Corporation has decided, subject to the consent of the Council, to widen Meadow Road to 60ft. from Great Wilson Street as far as the end of Water Lane. The Council will be asked to purchase the necessary land. A memorial was received from the tenants and owners of property in Lower Brunswick Street objecting to any proposal to block up the higher end of the street, which would have the effect of preventing easy access to North Street. The Committee informed the memorialists that there was no intention at present of blocking up the street, and promised that if any such step were contemplated in the

future they should have an opportunity of being heard on the subject.—The Building Clauses Committee of the Leeds City Council has sanctioned plans for the erection of a large wooden shed on the Engineers' Drill Ground off Camp Road, in which to hold the next Leeds Cattle Show. The edifice is to be constructed as quickly as possible, so that meetings in connection with the forthcoming Sanitary Congress may be held there. The proposals of the promoters were sanctioned subject to the improvement of the sanitary arrangements, and the provision of better exits in case of fire or panic.

LEICESTER.—The new Jewish synagogue in Highfield Street was opened recently. The lobby is reached through a semi-circular headed doorway, well recessed and of bold proportions, and from which is the entrance to the synagogue, the proportions of which are about 34ft. by 38ft. The synagogue has a semi-octagonal end, through which a recess has been placed to contain the Ark and Tablets with the Commandments. The pulpit is placed on the north-east side of the building, close to the wall, the reading desk being centrally placed. Seating on the ground floor will be provided for seventy-five. Revolving shutters cut off a school-room under the gallery adapted to accommodate seventy children, and when required this space is intended to be utilised as an extension of the synagogue, the accommodation being thus increased by more than fifty seats. In the gallery seats will be provided for seventy ladies. By an ingenious arrangement each seat will form the lid of a box, which will afford a receptacle for books, &c. It is proposed to heat the building by steam coils, and the electric current will be adopted for installation.

LEITH.—At Leith Dean of Guild Court Messrs. Pattisons, Limited, successfully applied for warrant to erect a warehouse nine stories in height at Bonnington. Messrs. Pattisons have recently acquired the old sugar refinery at Bonnington for the purpose of extending their storage accommodation. The old buildings are being partly demolished, and partly converted into bonded stores. In addition to the existing buildings, the firm is erecting a new bonded warehouse. The new building, which stands on the banks of the Water of Leith, has a railway siding running into it from the Leith branch of the North British Railway, and is 190ft. long by 180ft., and is nine stories high. The height from the foundations is close upon 100ft. The floorage area is 6½ acres. It is entirely built of brick, and there will be about one million and a half of bricks used in its construction. The interior, having to bear great weights, is entirely constructed with steel standards and steel beams, the old cast iron construction of bonded warehouses being abandoned. The Architects for the new building are Messrs. George Beattie and Son, of George Street, Edinburgh.

LIVERPOOL.—It is intended to carry out important alterations at the Liverpool Baths, and also provide new establishments for the rapidly increasing number of bathers. The Westminster Road baths have been improved in several respects—the second-class plunge has been renovated by means of clear tiles, and the first-class plunge has also been put in order. For gala purposes this north-east-end bath possesses features which will commend itself to the swimming fraternity on account of the increased length for competitions—100ft., as against 89ft. in the old days of competition. It is proposed to make similar improvements at the Lodge Lane establishment, where the second-class bath will be improved in length from 63ft. to 75ft., and other alterations in the direction of securing a bath for championships are contemplated, at a cost of £4000.

LONDON.—On a corner site at the junction of Carmelite Street, and Tallis Street, facing towards the Embankment, a building in the modern Renaissance style has just been erected for the National Press Agency. The material

used for the frontage is a rich red-coloured brick, with dressings of warm terra-cotta. Flanking the curve at the corner of the street, which contains the main entrance, are two towers surmounted with domes. The ornamental terra-cotta columns and archway which form the entrance support an oriel window. On the first floor is a series of circular bay windows, and on the third floor an arcade crowned with a handsome cornice. The trade entrance is in Carmelite Street, and from this a fireproof staircase leads to the upper stories. All the floors are of steel and concrete, and the columns are protected against fire, whilst hydrants are placed upon every floor, and all the windows facing the adjoining premises are protected with rolled steel shutters. The building is fitted throughout with the electric light, and great attention has been paid to the sanitary arrangements. The Architect is Mr. Edwin T. Hall, of Moorgate Street, while the contractor is Mr. Howell J. Williams, of Bermondsey.

NAIRN.—The new Church has now been opened. The site is very central and convenient at the corner of Seabank Road, at the west end of Nairn, and the edifice has been erected at a cost of £9000. The style of Architecture is of the Early English transitional period, and the plans were prepared by Mr. Stanniforth, Edinburgh. Its main external feature is a massive square tower about 100ft. high, in which is the main entrance. On either side of the main tower are two smaller towers, which give access to the galleries. Two large gables on either side give massiveness and beauty to the structure. The stone used is the old red sandstone of the district, and where the masonry is plain it consists of bold hammer-dressed rubble, which looks exceedingly well. The interior of the Church is transeptal in design, but has the unique feature of being really circular in form. Two memorial windows have been presented to the Church.

SCARBOROUGH.—The tenders for the work of constructing the proposed new Congregational Church in the North-West Ward at Scarborough, have been decided upon. The Church alone will be proceeded with at present. The initial seating accommodation will be for 500.

SOUTH SHIELDS.—The foundation stone of the new building for the South Shields Unionist Club Company was laid on the 28th ult. The new building will be erected from the designs of Mr. J. H. Morton. It will be four stories in height, with a frontage of 40ft. and a depth of 55ft. The general design of the façade is elaborate and handsome. On the ground floor there will be a large entrance hall, reading room, and smoke room 42ft. long. The first floor of the building will be utilised for the billiard-rooms. The building throughout will be lighted by electricity. Mr. W. J. Robertson, of South Shields, is the contractor.

STONEHAVEN.—The new hall, presented by Mr. William Mowat, View Mount, Stonehaven, to the Free Church, occupies a site adjacent to the Church on the west side. The hall externally has a neat appearance. The hall is 64ft. by 30ft., the roof being 15ft. high. Ample light is provided by side windows, filled with cathedral or obscured glass, and by an artistic window in the west gable. From the south-west corner of the hall a door leads to the session-house, an apartment 17ft. by 18ft. The wood fittings of the building are all of dark stained oak. The total cost of the building, the Architect of which was Mr. George Coutts, Aberdeen, was about £1000.

THIRSK.—Thirsk Parish Church, which was restored internally about eighteen years ago, is in need of considerable work on the outside of the fabric. This need was fully recognised at that time, but the work was reluctantly delayed owing to lack of funds. In various directions, notably in the windows of the south side, the stonework has wasted, and in order to prevent the building from further decay it became necessary to undertake extensive

repairs. The cost has been estimated by the Architect, Mr. Hodgson Fowler, of Durham, at £1250, and the work of restoration has already been commenced. In the report of his inspection of the Church the Architect says that "built as the Church is, of a soft stone, it is wonderful how well, on the whole, it has stood; but undoubtedly very considerable portions of it are now in such a state of dilapidation that, if suffered to continue, the decay would increase more rapidly every year."

TODMORDEN.—Todmorden new Liberal Club has now been formally opened. The new premises are very conveniently situated, and before being adapted for a club, and prior to the building of the Town Hall, were used as the County Court. They have a frontage on the main street, right in the centre of the town, and it is safe to say that few provincial towns of lesser importance can boast so commodious and handsomely furnished a club. The large billiard room is fitted with three tables, and the building also includes reading, conversation, and committee rooms.

TORQUAY.—New Church Schools were recently opened at Upton, which have been erected by the Torquay Elementary Church Schools Union, to avoid the formation of a School Board for the borough. Situated at the bottom of Mudge's Hill, close to St. James's Mission House, the schools provide accommodation for 300 children, and comprise three class-rooms, the largest being 86ft. long by 24ft. wide, and 24ft. high. Well ventilated, with ample cloak-room and other accommodation, the buildings are of local brick with Bath and Limestone dressings. Intended for use as a mixed school, the boys, girls, and infants can be separated, but the playground is very limited. Erected by Mr. S. G. Trethewey from designs by Mr. Edward Richards, Manor Architect, the total cost is about £2800, the contract being for £2185. Towards this £570 has been raised, and £1580 guaranteed.

WAKEFIELD.—Sir Edward Green, Bart., opened a large Board School in Wakefield on the 23rd ult. The building, which is in Ings Road, has cost about £14,500, and accommodation has been provided for 600 children, while provision can be made for 240 more. The furnishing has been executed by Messrs. Illingworth and Ingham, of Leeds; the electric light fittings are the work of Mr. Edmondson, of Leeds; and the warming and ventilating arrangements are by Mr. W. Key, of Glasgow. The school was designed and the works have been carried out under the direction of Messrs. W. and D. Thornton, of Wakefield and Dewsbury. Messrs. Denholme and Co. have executed the masons and bricklayers' work, and Mr. John Lloyd the carpenter and joiners' work.

WORCESTER.—A special meeting of the city council was held recently to receive a report of the water and Sewerage Committee upon the question of the disposal of the city's sewage. The Committee reported that it had had an interview with Messrs. Beesley and Sons with regard to their scheme, which was awarded first prize in the recent competition, and recommended its acceptance, if the Local Government Board's sanction to a loan of £48,000 could be obtained. The recommendation was carried, with the substitution of £52,000 for £48,000.

YARMOUTH.—A revolving observation tower has just been opened at Great Yarmouth. It is a hexagonal structure of open ironwork, upwards 120ft. in height, resting on solid concrete, and, it is the first of the kind erected in this country. The great novelty is the external car, with its moving platform, accommodating 150 persons. The car ascends, and the platform revolves by steam power, affording magnificent views on every side. At the base of the tower, and surrounding the enclosed machinery, is a spacious pavilion, containing a refreshment buffet and shops. The tower and its associated buildings have cost over £5000.

## SOCIETY MEETINGS.

**Shropshire Archaeological and Natural History Society.**—The annual excursion of the members of this Society was held under the guidance of the Rev. T. Auden, F.S.A., Chairman of the Council, with the assistance of Mr. F. Goynes, secretary, to Brown Clee Hill, with the special object of visiting Abdon Burf. At Cleobury North they visited the Church, which possesses an Early English chancel arch of peculiar proportions, with corresponding arches forming a south aisle, and a font of the same, or possibly earlier, date. There is also a good screen of Perpendicular woodwork, which now encloses the font, and there is besides some good woodwork of a later period, especially the pulpit, which bears the date 1628. On Abdon Burf, the Rev. T. Auden read a short paper, in which he pointed out that it was a pre-Roman settlement, probably belonging to neolithic times, the round depressions in the soil marking the pit dwellings of its early inhabitants, and the stone circles being probably associated with worship. He concluded that Abdon Burf owed its origin to the non-Aryan dolicho-cephalic race of swarthy complexion, known as Iberians, whose descendants were the Silures, who, in that region, gave so much trouble to the Roman forces under Ostorius Scapula. This paper was followed by a short address from the Rev. A. Thursby-Pelham.

**Bradford Historical and Antiquarian Society.**—The members of the Bradford Historical and Antiquarian Society recently had an excursion to Barwick-in-Elmet and Aberford. The party was met at the Church by the Rev. C. P. Morris, who described the various objects of interest in and about the building. The present tower of the Church dates from the fifteenth century, and is built of two kinds of stone—the lower portion of magnesian limestone and the upper of sandstone, giving the tower a somewhat piebald appearance. That an earlier Church than this existed is proved by the fact that the first rector mentioned was Rad de Bodeham, in 1235. The remains of what has evidently been part of a Saxon Church are still to be seen in the present building. The Church contains some beautiful stained-glass windows in memory of some members of the Vavassour family. After viewing the Church the party proceeded to the Wall Tower Hill, from which a splendid view westward was obtained. Mr. Morris described the old British earthworks, which are very extensive, and are in a good state of preservation.

**Institution of Mechanical Engineers.** The proceedings of the Jubilee meeting of the Institution of Mechanical Engineers were resumed at Birmingham on the 27th ult., but only half the day was devoted to business, the afternoon being spent in visiting various places of interest. Mr. E. Windsor Richards again presided over the morning sitting. Mr. Alfred Morcom read a paper upon "High Speed Self-Lubricating Steam Engines." A technical discussion occupied the meeting until midday, and the reading of the other papers which had been prepared was deferred until a subsequent meeting. In the afternoon various works in Birmingham, and at Wolverhampton, Dudley Port, and Oldbury were visited. Stratford-on-Avon, Leamington, Coventry, Warwick, and Rugby were amongst the places visited at the end of last week.

The Westminster Vestry has decided to take up the wood pavement in Victoria Street, Milbank Street, and Chapter Street, and to relay those thoroughfares with compressed asphalt. The work is to be carried out by the Limmer Asphalt Paving Company (Limited), of 2, Moorgate Street.

The Commissioners of Northern Lighthouses are now inviting tenders for the erection of a light tower, engine-house for fog signal, and dwelling houses for the principal and assistant lightkeepers on the Blackhead, a bold promontory about two and a half miles north of Portpatrick Harbour, on the west coast of the Irish Channel.

## Trade and Craft.

## AN IMPORTANT POINT TO CONTRACTORS.

The House of Lords last week delivered judgment in the case of the Kent County Council v. Lord Gerard, which raised the question who was liable to compensate the County Council for damages to roads by extraordinary traffic. Lord Gerard was rebuilding his mansion at Eastwell Park, and large quantities of building and other materials were hauled there by traction engines, considerable damage being done to the roads. The County Council claimed that Lord Gerard was liable, but he maintained that if anyone was liable it was the contractors. The magistrates before whom the case first came held the respondent was liable. The Quarter Sessions reversed this decision, but on appeal the Queen's Bench Division reversed the judgment of the Quarter Sessions, and, again, the Court of Appeal reversed the decision of the Queen's Bench. Their Lordships affirmed the judgment of the Court of Appeal, holding that Lord Gerard was not liable.

## BUILDING LAND IN THE CITY.

The Commissioners of Sewers have recently sold a large area of vacant land in Monument and Widegate Streets at excellent prices. The building land in Monument Street, with frontages amounting in the aggregate to 435ft., and a total area of about 10,700 square feet, has been nearly all disposed of. Lot 19, having a frontage of 19ft. and a superficial area of 560ft., and lot 20, having a frontage of 25ft. and a superficial area of 460 square feet, sold for £3500, and lot 36, having a frontage of 19ft. 6in., and containing an area of 420ft., fetched £1400. Five lots were disposed of by private contract for £14,000, leaving only five portions of land in the street unsold. The various lots which have been recently offered for sale in Widegate Street possessed a total frontage of 500ft., and contained in all an area of about 9634 square feet. Several of the best portions were disposed of by private treaty for £5435, while others realised £3900. There now remains only one lot unsold, a small piece of land on the south side of the street.

## THE WALTHAM ENGINEERING COMPANY.

The beauty of the designs in Ormolu which the French nation of the last two centuries has bequeathed to posterity is well known, and to those who admire it most we would recommend the latest catalogue of Art metal work of the Waltham Engineering Company. To such it will prove a work of seductive interest, for therein are illustrations of almost every form of design of fittings in Ormolu which the eighteenth and nineteenth century designers of France produced. The styles distinctly peculiar to Louis XIII., XIV., XV., XVI., have all examples included, for it must be borne in mind, that in those days a change in King or Constitution meant a change in Art. Special care has been bestowed by the Waltham Engineering Company upon the accurate copying of the original models preserved at the present day in the public museums of France, and the work of adapting and manufacturing candle lights, the Company has entrusted exclusively to its Paris works, by which means a greater purity of style, and more exquisite finish are obtained. In addition to the many designs in Ormolu of gas brackets, pendants, candelabra, and the like, some pretty patterns of chased door and switch plates are also shown, whilst there is considerable variety in fittings in wrought iron, brass, and copper. And beauty of design is here equally conspicuous. Although it is in wrought iron work that ample indication of the progress of Art on the Continent during the Middle Ages can be found, and although some of the finest examples of smiths' work ever produced came from Germany at that time, it is pleasing to note that many of the most original and beautiful designs illustrated in the Waltham Engineering Company's catalogue had their origin in our own country. The demand for cheap and simple forms of electric light fittings has also claimed the Company's earnest atten-

tion. And whilst the greatest economy has been practised, mechanical soundness has at the same time been preserved.

## THE KEY METHOD OF VENTILATION.

Key's plenary method of mechanical ventilation and warming possesses many points of novelty and efficacy which lay claim to the general attention, and the thorough application of the system throughout the buildings of the Birmingham General Hospital, opened in July by the Princess Christian, is only one of the many pronounced successes won by Mr. William Key's novel system. Air is drawn from a point where it is of undoubted purity, and passes through an outer warming coil and then through the air filtering, air washing, and humidifying screen, which becomes in no way unclean or insanitary. Water which has become polluted by impurities is not used over and over again. Air is afterwards warmed by contact with coils clustered in batteries within the air-warming chamber, and a reduction in temperature is easily obtainable by the admission of filtered cold air through the bye-pass doors. Pure air entering a room is directed to the ceiling, and the air which is being continuously forced out of the room passes off at the floor level, and is led to roof ventilators, where the outlet air valves are so constructed as to place the whole air within the building under a pressure of about four ounces per square foot in excess of the outside atmospheric pressure of the time. Unaffected by the outside elements, therefore, a room or building ventilated on the Key system has incessantly a passage of air from ceiling to floor—a system of ventilation which, for purity and perfect arrangement, is equally meritorious. It certainly is a very efficient method for Churches and public buildings generally, with pure air warmed or cooled at will.

## THE COST OF LONDON SCHOOLS.

The sixth annual report of the Works Committee of the London School Board has just been published. During the year ended March 25 the Board agreed to purchase various interests and sites, at a cost of £116,561 13s., the surveyor's fees, &c., agreed to at the time of purchase amounting to £659 19s. 6d., the value of all sites purchased, or agreed to be purchased, previous to March 25, 1896, was £3,105,850 9s. 11d., and costs, £429,961 5s. 9d. The total cost, therefore, of the sites purchased up to the year under review was £3,222,412 2s. 11d., and costs, £430,621 5s. 3d. On March 25 last the following was the amount of school accommodation in course of provision: Eighteen schools were in course of erection, providing accommodation for 19,013 children; and nine enlargements were in course of erection to accommodate 3521 children. Thirty-two additional sites for new schools had been or were to be purchased. The schools to be erected on twenty of these sites would provide accommodation for 17,920 children. In the case of the remaining twelve sites the accommodation to be provided had not yet been determined. Ten sites for new schools had been scheduled in the season 1896-7. The schools to be erected on five of these sites would provide accommodation for 4185 children. In the case of the remaining five sites the accommodation to be provided has not yet been determined. Twenty-four enlargements of schools had been sanctioned by the Education Department or the Board, for which tenders had not been accepted, providing accommodation for 8075 children. The Education Department has also sanctioned the provision of sites in five districts (which would be scheduled next season). The school to be erected on one of these sites would provide accommodation for 800 children. In the case of the remaining four sites the accommodation to be provided had not yet been determined. Although we understand that the report is considered a satisfactory one, for our part we think a great deal of money is wasted on the purchase of valuable sites when less expensive ones would answer the purpose. It is another case of spending other people's cash.

## A SANITARY AUTHORITY OVER-ruLED.

The case of Wood v. Mayor of Widnes was tried in the Queen's Bench Division last week. The appellant was the owner of certain houses, 52 to 68, Terrace Road, Widnes. At a petty sessions holden at Widnes a complaint was preferred against him by the respondents under section 36 of the Public Health Act, 1875, claiming payment of certain private improvement expenses in respect of slop water-closets fixed at the appellant's houses. The justices adjudged that the respondents should recover the sum claimed. The facts were as follows:—On Feb. 12th, 1895, the respondents, who were the urban sanitary authority for the borough of Widnes, confirmed the following resolution of the Health Committee: "Waste water-closet system. Resolved—That in all future cases of nuisances requiring the reconstruction of privies and ashpits the local authority of this borough do, as far as practicable, order that such privies and ashpits be converted into the waste water-closet system, or into such other water-closet system as the local authority may from time to time approve, and that the Highway Committee be requested to take such steps for the adoption of the first-named system generally throughout the borough." On March 22, 1895, the respondents' inspector of nuisances served upon the appellant a notice requiring the appellant to abate a nuisance at his premises, 52 to 68, Terrace Road, by converting the privies into water-closets. On April 3 the inspector reported that certain houses in the borough, including the appellant's, were without a sufficient water-closet, earth-closet, or privy, and on April 9 the respondents confirmed a resolution of the Health Committee that notice be served upon the appellant and the other owners of the houses, requiring them to provide sufficient privy and ashpit upon the waste water-closet system approved by the Corporation. On April 23 notice was served upon the appellant in accordance with the terms of this resolution, and the notice not having been complied with, the respondents did the necessary work, and then took these proceedings to recover the amount. It was contended for the appellant that the resolution of February 12th and the subsequent proceedings thereunder were invalid. The question of law for the opinion of the Court was whether the resolution of February 12th was valid, or, if not, whether it invalidated the subsequent proceedings. — Mr. C. A. Russell, Q.C., for the appellant, contended that the respondents could only require an owner to provide a sufficient water-closet or privy. They were attempting to enforce in every case the substitution of a particular kind of water-closet, viz., the slop water-closet, for privies. There was no power to do that, and the proceedings were invalid. — Mr. McCall, Q.C., for the respondents, contended that it had been decided in many cases that a sanitary authority could substitute water-closets for privies. — The Court allowed the appeal. — Mr. Justice Lawrence said that it was contended for the appellant that the respondents had, by the resolution of 12th February, adopted a general rule that a particular kind of water-closet was to be used, and that this rule was to be applied in all cases, without any regard to the particular requirements of individual houses. In his Lordship's judgment the local authority was not entitled to do that. They must inquire into each case, and, although it was not disputed that in every case they could require a water-closet to be substituted for a privy, they were not entitled to say that only one particular kind of water-closet should be used. Section 36 of the Public Health Act, 1875, used the expression a "sufficient" water-closet, and that was all that the local authority was entitled to demand. In his Lordship's opinion the resolution of 12th February and the subsequent proceedings were invalid, and the appeal must be allowed. — Mr. Justice Ridley concurred.

## NEW BRIDGE OVER THE LEA.

The opening of the new bridge over the Lea was celebrated at Clapton a day or two ago.

The structure takes the place of the one erected on the site in the latter part of the last century, and carries the Lea Bridge Road over the river, joining the County of London with that of Essex. It has been built by the London County Council, in conjunction with the Lea Conservancy Board, the Essex County Council, and the Leyton and Walthamstow Tramway Company, the total cost being £8399. By the use of a central girder, the road has been divided into two parts, giving 16ft. on either side, sufficient for two lines of traffic. The Chairman of the Bridges Committee of the London County Council said the task was not an easy one, as the Lea Conservancy wanted the bridge raised, while the Tramway Company and those who were proprietors of vehicles objected to a steep ascent. The problem had been very happily solved by Sir A. Binnie, the chief engineer of the London County Council, by means of the large girder, with access to the lower part. When it had constructed the proposed foot tunnel at Greenwich, and another large tunnel between Shadwell and Rotherhithe, he thought the London County Council would have done very well for the interests of traffic in East London.

## LIABILITY FOR ROAD REPAIRS.

At the Amersham (Buckinghamshire) Petty Sessions a case of importance to local authorities and others was heard. The Chesham Urban District Council claimed from Mr. B. Barnett, of Henrietta Street, Covent Garden, the payment of the sum of £117 4s. as extraordinary expenses incurred in repairing a portion of the highway within its district, by reason of the damage caused to it by excessive weight passing along the same, or extraordinary traffic thereon. The defendant, who trades under the style or firm of the Bellingdon Brick Company, hauls his bricks by means of traction engines and trucks, and these were alleged to have damaged the road to the extent named. The defence was that this particular road was never properly made by the Council before the haulage began, and that last winter's abnormal rainfall must be taken into account. Fifty pounds were offered in settlement of the claim. The magistrates awarded the Council £83 17s., reserving the question of costs.

## MESSRS. WILSON AND CO.

We have recently had an opportunity of inspecting Messrs. Wilson and Co.'s patent Dripless Roof Lights, at the head office of the North British and Mercantile Insurance Company, in Threadneedle Street, City. Wilson's Dripless Roof Lights are constructed to answer the purpose of a roof or skylight which is horizontal, and may be walked on.

Hitherto, the objection in using roof lights of the ordinary description has been the collection of a large amount of condensation, which drips incessantly. This moisture is, by Wilson and Co.'s patent shaped lenses, made to run to the sides of the lenses, and fall into a gutter formed in bars which collect this moisture, as seen by a section of the lenses in the frame shown in our illustration. The North British Insurance Company has been considerably enlarging its extensive premises in the rear by the erection of two blocks of buildings, with a space about 50ft. by 16ft. between the two buildings, and it is this space which Messrs. Wilson and Company have covered with

their patent roof lights, under the direction of Mr. Sheppard, the Surveyor to the North British Company. The whole of the ground floor is therefore all one large room, lighted in the centre by this ornamental horizontal roof light, consisting of fourteen large moulded cast-iron frames, filled with the patent fluit glass concave lenses, 9½in. by 9½in. square, each of the fourteen frames containing forty-nine lenses having a floral design, whilst the frame-work is enamelled white and gold with aluminium rosettes at the corner of each of the square lenses. In addition to this large ceiling light, the directors have had all the old-fashioned skylights and lead flats taken out, and Wilson's patent horizontal lights substituted. We are informed that the first cost of these lights is not more than the usual lantern and ceiling lights, and that the cost of maintenance is nil — and this with the great addition of light obtained by carrying the glass line close to the walls on all sides, dispensing with the lead gutters usually met with. The high-class appearance and pleasing efficacy of this work fully explains the popularity of Messrs. Wilson's patents. The Company's address is 24, Harrison Street, Gray's Inn Road, W.C.

MR. FRAMPTON'S statue of Dame Alice Owen, now in the Royal Academy, which is to be placed in the hall of the school at Islington which bears her name, will be unveiled in the early part of October.

We understand that the house built by the late Mr. Barney Barnato in Park Lane has been purchased by Sir Edward Sassoon (heir of the late Sir Albert Sassoon, of Brighton), for the sum of £100,000.

PRINCESS LOUISE, Marchioness of Lorne, last week opened the new building of the Grosvenor Hospital for Women and Children, situate in Vincent Square, Westminster. The cost of the new building is estimated at £12,000, towards which Lady Korthright has given £8000.

THE fine block of buildings at the corner of Dover Street and Piccadilly, comprising the Avondale Hotel and Restaurant, Hatchett's Restaurant (old White Horse cellars), and three shops, was offered for sale at the Mart last week, but not sold, being withdrawn at £140,000.

THE restoration of the ancient Abbey Church, Llanthony, Monmouthshire, through the munificence of Lord Llangattock, Mr. Walter Savage Landor, and others, is almost completed, and the Church will very shortly be re-opened by the Bishop of Llandaff. Mr. Spencer, of Abergavenny, is the Architect.

A NOTABLE domain was recently put up to auction and withdrawn, the highest offer,

£152,000, not reaching the reserve. This was Ditton Park, the Buckinghamshire seat of the late Dowager Duchess of Buccleuch. The mansion was rebuilt for the second time, in 1813, by Elizabeth Duchess of Buccleuch. The house still exhibits some marks of antiquity, particularly the old tower.

THE small estate of West Bangour, near Uphall, has been purchased by Mr. Addison Smith on behalf of the Edinburgh Lunacy Board at the price of £13,000. The property has been purchased for the purpose of erecting upon it a new asylum for pauper lunatics in consequence of the necessity imposed upon the Board of removing the pauper lunatics from Morningside Asylum.

## TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

**ABERTILLY (Mon.)**—For the erection of school buildings, for the Aberystwith School Board. Mr. G. Rosser, Architect, Victoria-buildings, Aberystwith. Quantities by Mr. R. L. Roberts, Holly House, Newbridge:—  
Williams & Thomas £2,355 0 J. Monks and Co. £2,146 0  
Lawson and Co. 2,190 0 C. F. Morgan 2,095 0  
Rowland and Lloyd 2,175 0 A. P. Williams, Aberystwith 2,157 0  
Jno. Jenkins 2,157 0 tillery\* 2,073 15  
\*Accepted.

**ASHTON-UNDER-LYNE**—For the construction of a brick culvert, Timperley Clough. Mr. J. T. Earnshaw, Borough Surveyor, Town Hall, Ashton-under-Lyne:—  
R. C. Fish Accepted on a schedule of prices.

## BOROUGH of BOURNEMOUTH.

First-class ARCHITECTURAL DRAUGHTS-  
MAN, experienced in the design of constructional iron-  
work, WANTED for about six months.

Apply by letter, stating experience and salary required.  
F. W. LACEY, M.Inst.C.E.,  
Borough Engineer,  
Bournemouth.

## BUILDER'S CLERK WANTED. Accurate

quantity-taker, good draughtsman, book-keeper,  
used to measuring-up work, and general routine of  
office.—Apply, stating age and salary required,  
HUBBARD, JUN., Contractor, East Dereham, Norfolk.

THE CORPORATION of the CITY of  
BIRMINGHAM.

SEWER FOREMEN are REQUIRED in the City  
Surveyor's Department, at a commencing salary of 35s.  
per week.

Candidates, whose age is not to exceed 35 years, must  
be thoroughly qualified persons, having had a practical  
experience in the construction of works of sewerage  
and house drainage, and in the management of work-  
men, be able to set out works accurately, and keep the  
necessary books, and will be employed the same hours  
as the working staff.

The persons who are appointed will be required to  
devote the whole of their time to the work of the  
department.

Applications in the candidate's own handwriting,  
stating age and qualifications, present and past employ-  
ment, together with copies of three recent testimonials,  
endorsed "Sewer Foremen," to be sent to the under-  
signed not later than AUGUST 6th next.

Canvassing, either directly or indirectly, will be con-  
sidered a disqualification.

JOHN PRICE,  
City Surveyor's Office, City Surveyor.  
The Council House, Birmingham,  
July 27th, 1897.

EDMONTON URBAN DISTRICT  
COUNCIL.

The Edmonton Urban District Council invite APPLI-  
CATIONS for the APPOINTMENT of a BUILDING  
INSPECTOR, to see that buildings, sewers, and drains  
are properly constructed, to fix and check levels of  
sewers and drains, to make surveys of all new houses,  
buildings, and drains, and to perform all the duties set  
out in the Standing Orders of the Council.

The salary will be £130 a year, rising by annual in-  
crements of £5 to £150 a year, and candidates must be  
prepared to enter upon the duties within one month  
after notice from the Council's Engineer, from whom  
further particulars may be obtained.

Applications, accompanied with testimonials, to be  
sent to G. EIDES EACHUS, Esq., Town Hall, Edmon-  
ton, on or before THURSDAY, AUGUST 19th next.

Canvassing will disqualify.

By order,

Town Hall, WM. FRANCIS PAYNE,  
Lower Edmonton, Clerk,  
July 28th, 1897.

## CLERK of WORKS REQUIRED for

Laundry Buildings near London. £3 10s. per  
week; also part services of two hours per day of CLERK  
of WORKS for overlooking painting at Holborn, £1 1s.  
per week. Write, Box 179, Willing's Advertisement  
Offices, 125, Strand, W.C.

## BUILDER'S CLERK WANTED. Must

write shorthand and used to general office routine.  
—Apply by letter, stating age, references, and salary  
required, to A. D., 1, Ellerthorpe-street, Poplar.

AUGUST 4TH, 1897.

## THE SEWERS COMMISSION: A RETROSPECT.

ONLY a little more than six months' life is left to the Sewers Commission. The Bill for its abolition has received the Royal assent, and, as a consequence, on Plow Monday next, just 232 years after its formation in the reign of Charles II., it will cease to exist, and its duties and responsibilities will devolve upon the Corporation. The Commission has an honourable record to look back upon, and in its closing weeks it can comfort itself with the reflection that its extinction by Act of Parliament is actuated not by any neglect of duty or by any malversation, as, alas! must be said of the old Metropolitan Board of Works, but by the fact that it has discharged its duties so thoroughly that the Corporation, by whom it has hitherto been appointed year by year, desires to take upon itself the credit that attaches to the municipal work that it has been discharging. The Act that has just been placed upon the Statute Book emanates indeed from the Corporation in the person of the Special Committee, and the change has been brought about with the idea that it will strengthen the hands of the City

### BY MEANS OF THE CONSOLIDATION

that will be effected. In one sense the Act may be said to date back to the report made by the Unification Commission in the year 1893. In that document stress was laid on the fact that the Sewers Commission performed the municipal work of the City, and the suggestion was made, indirectly it is true, but at the same time not the less pointedly, that the Commission should become the sole authority for the City of London. The reverse operation has been now carried out. Now that the change has been made, says the City Press, it will devolve upon the Special Committee of the Corporation to devise a scheme by which the work hitherto performed by the Commission may be assumed by the older body. What course will be taken it is not possible as yet to say, but doubtless a conference will be sought with the Commission for the purpose of arranging for the transfer on lines that will be mutually satisfactory to all parties concerned. This is not the place in which to discuss the details, but it may be incidentally mentioned, as a point that will require especial attention, that some definite understanding will have to be arrived at as to

### THE CONDUCT OF PUBLIC BUSINESS.

Will the Corporation create a separate department for this work, as originally intended, or attempt to transact the Sewers business by means of committees, each committee to report to the Court, as is the case at present with the Corporation committees; or will the Court decide to hold one week a meeting for disposing of its civic business, and in the following week a meeting for the settlement of the business now performed by the Commission at its fortnightly meetings? The latter proposal appears

to be the more reasonable, as otherwise the Thursday's sittings of the Court would be prolonged to an extent that would prove a great strain on the members. On the other hand, if there is to be a weekly meeting, how will it be possible for the Lord Mayor, with his numerous other duties, to act as president? He would have to appoint a deputy, and if so, that deputy, though nominally holding a less important office than that occupied by the chairman of the Commission, would undoubtedly as an actual matter of fact be invested with far greater responsibilities. It is interesting to follow the

### HISTORY OF THE COMMISSION,

and to sketch the progress it has made during the 200 years since the Great Fire of London, and the changes that have been brought about by the passage of time. The origin of the Commission is to be found in the work of reconstruction that was rendered necessary by the Great Fire. But, indeed, for that great catastrophe, in all probability no such body would have been formed, and we should find the Corporation both actually and nominally the municipal authority of the City. The Act under which the Commission sprang into existence became law in the year 1667, and was termed an Act for Rebuilding the City after the Great Fire. Section 22 provided that the number and place of every sewer, drain, and ventilator, and the order and manner of paving and pitching the streets and lanes of the City, should be designed and set out by "such and so many persons" as the Mayor, Aldermen, and Commonalty in Court of Common Council assembled should from time to time appoint under the Common Seal of the City. A further section gave authority to such persons "or any seven of them," to impose "any reasonable tax in proportion to the benefit" to be derived. This section is especially interesting from two points of view. In the first place it fixes the quorum that exists to-day; and here it may be remarked that the Commission is appointed year by year in almost the same phraseology that was used when the new body was formed originally. In the second place this clause as to the imposition of "any reasonable tax," rather suggests that even in those early days

### THE QUESTION OF BETTERMENT.

was receiving attention. At the outset it was intended apparently that the new body should be but temporary, and that when the work of reconstruction had been completed the Commission should quietly disappear and the Corporation once again wield undivided authority. If this was the intention it was soon departed from. Three years later another Act was passed by which the Commission was made permanent. Clauses were added, moreover, that invested the Commission with further powers in regard to street cleansing, &c. In the year 1708 a further Act was passed, and then for the first time the title of Sewers Commission was used, while that body was

clothed with all the municipal functions discharged by any Sewers Commission in any part of the country. In the year 1768, for reasons that are not quite clear, although we may hazard the assumption that it was because there was a movement in certain quarters to deprive the Commission of

### THE POWERS IT EXERCISED,

a further Act was obtained that set forth that the authority of the Commission "shall be in no way suspended or taken away," save by the appointment from time to time of a new Commission by the Corporation. In the year 1771 the first mention is made of the question of rating—that is, as far as an actual sum is concerned. It was then enacted that for the purpose of defraying expenses a rate should be made that was not to exceed "in any one year" 1s. 6d. in the pound on the yearly rent of "such land and houses as shall be situate in any street actually begun to be new paved." The rate for any property "not so situated" was fixed at 1s. In the same Act authority was taken to charge only half rates on empty houses. Further, it was decided that the rating of Churches and public buildings, "the hospitals and St. Paul's alone excepted," and "void spaces" should not exceed 4d. Yet another clause provided that

### "DEAD WALLS" SHOULD BE CHARGED

not more than 6d. per yard "per running measure." The rate, by the way, still remains at 1s. 6d., and the relieving of empty houses to the extent of 50 per cent. is also in force. The year 1817 witnessed the placing on the Statute Book of what is generally known as Michael Angelo Taylor's Act. This measure gave the Commission, with other kindred municipal bodies, the right to effect street improvements, pave, cleanse, and water the streets, and regulate encroachments. In the year 1823 the distinction as to the rating of houses in paved and unpaved streets was abolished, and the rate was fixed at 1s. 6d. all round. The year 1866 was rendered remarkable by the fact that for the first time the then Commission did not run its full term. It was "superseded," to use the word that was adopted, by the Court of Common Council, in order that the strength of the body might be increased in view of the growth of the business it was called upon to perform. In the past the numbers had been strictly limited, but then they were increased to 83 by the inclusion of all the Aldermen and Deputies. In the year 1875 the Artizans and Labourers' Dwellings Improvements Act served to yet further extend the duties of the Commission. Advantage was immediately taken of the provisions of that useful measure, and the Commission, at an outlay of £328,765,

### CLEARED A LARGE AREA,

and erected model dwellings to accommodate as many as 1000 persons. This effort was the first and last made in that direction, not because the Commission was anxious in any

way to shirk its duties, but because all the land that would have been available for buildings was absorbed for commercial purposes. It is of interest to note in this connection that, though the Act gives authority to the Commission to charge a rate for the erection of such dwellings, no advantage was taken of this privilege, and the sum required was defrayed by means of a loan raised on the security of the Consolidated Rate. These buildings, from which an income of about  $2\frac{1}{2}$  to 3 per cent. on the total original outlay is derived, have, by-the-way, proved a great boon to the class for whom they were designed. This article would be incomplete were it not to briefly indicate the great work the Sewers Commission has performed during the past half century. Finance commands primary attention. Judged from this point of view, the Commission is honourably distinguished from the majority of rating bodies. Rates have gone up all round, but that of the Sewers Commission has remained stationary, and at the present time the rates are less by 6d. in the pound than they might legally be. For instance, although the Commissioners are empowered to levy, for their own purposes, a consolidated rate of 1s. 6d. in the pound and a sewer rate of 4d. in the pound, they have still a rating margin of 3d. in the pound on each rate. This state of affairs is the more satisfactory seeing that the

**ARTIZANS' DWELLINGS HAVE BEEN PROVIDED** without any burden being imposed, and that within the last fifty years the City has been practically reconstructed, so numerous have been the improvements the Commission has carried out. As regards its debts, the Commission has every reason to feel proud. In spite of the outlay it has incurred its loans are now about £1,350,000, whereas four years ago they were £1,620,624. Naturally, the great increase in the assessments is in a sense responsible for this, the receipts from this source now being upwards of £504,000, whereas in the year 1893 they were only £433,000; but this fact is not alone responsible, and great credit attaches to the Commission for the existing satisfactory position of the finances. The Commission has all along led the van as regards municipal progress; and the question as to acquiring land down the river for the purposes of a dust refuse farm is an indication that in the closing year of its history it possesses as much vigour and vitality as has ever characterised it. Much might be written as to

#### THE MUNICIPAL DEVELOPMENTS

that from time to time have marked its career, but for present purposes it will be sufficient to indicate a few special new departures that have been generally adopted. For instance, it was the first local authority to adopt asphalt paving. Fifty years ago the streets were paved with cobble stones, and the paving we know to-day was undreamt of. Little by little improvements were introduced, and finally, not quite thirty years ago—1869, to be exact—asphalt was experimentally laid in Threadneedle Street, the success being so marked that it was soon generally adopted. In the year 1867 the City first marshalled a corps of orderly boys, in this way again setting an example other bodies were not slow to follow. Ilford Cemetery, which was laid out at a cost of £82,000, and in which as many as 300,000 interments have taken place, was another useful work, while a minor improvement, in which once more the City led the way, municipal authorities the world over following suit, consisted of the construction of underground conveniences. Of the outlay on street improvements it is unnecessary to say more than that as many as 300 streets have been widened or improved in the past fifty years, and that the net cost to the City, exclusive altogether of its contribution of one-eighth of the entire rates of the metropolis, has been close upon three millions sterling. Some idea of the work the Commission now discharges year in and year out may be judged from a few facts that may be given almost at random.

**THE PUBLIC WAYS OF THE CITY** extend over about fifty miles, the cost of keeping the streets in repair is over £40,000,

as many as 25,000 load of refuse are annually disposed of in the dust destructor, the cleansing department gives employment to 650 hands, the paving of the streets cost more than £35,000, the lighting involves an outlay of £16,000, for cleansing and watering £46,000 is expended, and the repayment of loans and interest runs away with nearly £120,000. These figures afford a fairly comprehensive idea of the work the Commission performs, and will convince even the most grudging ratepayer that there is plenty to do with his 1s. 3d., and that economy in administration must be a ruling principle when for so small an outlay, comparatively speaking, he has the proud satisfaction of knowing that the "one square mile" is, from a sanitary point of view, the best administered City in the world.

#### SEWAGE DIFFICULTY AT MANCHESTER.

**A** DEPUTATION from the Mersey and Irwell Joint Committee, a few days ago, had an interview at the offices of the Local Government Board with Mr. T. W. Russell, M.P., Parliamentary Secretary of the Department, their object being to obtain a relaxation of the rule according to which sewage purification must be done by means of filtration through land. The deputation wished that artificial filtration should be allowed. Sir J. T. Hibbert, one of the deputation, said the subject was of great importance to the Mersey and Irwell district, which contained seven county boroughs, with a population of 1,148,000; eleven non-county boroughs, with 249,000 inhabitants; sixty-two urban district councils, ruling 620,000 persons; and ten rural district councils, under whose jurisdiction were 127,000 inhabitants. The total rateable value of the district was £9,731,000. The Joint Committee dealt with four rivers—the Mersey, Irwell, Irk, and Medlock—on the banks of which were 394 manufactories. The Committee was formed under the Act of 1888, and had almost succeeded in keeping solid matter out of the streams. In dealing with liquid sewage it had made great progress. Its task was a growing one. When it began there were only twenty-seven works in operation within their district; last March the number had increased to forty-seven, all

#### IN URBAN SANITARY AREAS.

Besides these there were five in rural sanitary areas. The works which were being built when the Committee began were eight; in March last they were thirty-two. Urban and rural authorities had their schemes in twenty-four places for preventing the pollution of rivers. Great progress had been made in preventing the pollution of rivers by manufactories, the manufacturers having behaved in a very liberal manner. Of 394 works 186 had now efficient means of purification—a phrase which, unfortunately, did not necessarily mean perfection. In 202 cases means which could not be classed as efficient had been adopted. Seven firms were now making arrangements to purify the liquid they discharged into the rivers, and only five were doing nothing. In seeking this interview the deputation had in mind not so much the manufacturers as the local authorities, especially those with large constituencies like Manchester and Salford. The policy of the Committee was to deal with every authority, large or small, on the same principles. It had taken action against the Manchester people, who pleaded guilty, and were allowed twelve months in which to prepare an amended scheme to avoid river pollution. Proceedings against Salford had resulted in laying that borough under a penalty. Neither town had yet proposed a scheme which the Committee considered satisfactory. Manchester had embodied in a Parliamentary bill a proposal to discharge its sewage in the Mersey below Warrington, after treating it artificially. The bill was withdrawn, otherwise the Committee would have opposed it. Knowing the difficulties of Manchester and Salford in getting land for the filtration of sewage, the Committee instructed its chemical adviser (Sir H. Roscoe) and its

chief engineer (Mr. Tatton) to report on the subject of precipitation and artificial filtration. The report of the first-named gentleman contained this passage: "I am of opinion that the

#### ADOPTION OF ARTIFICIAL FILTERS

is a move in the right direction, especially in the case of large towns having difficulties in acquiring sufficient area of land and of a suitable character for the purification of its sewage. Land filtration, so far as the chemical results are concerned, is superior to artificial filtration. Unfortunately, however, the volume of effluent that can be treated permanently on land is small as compared with the volume that can be filtered by artificial filters." Among Mr. Tatton's conclusions were the following:—"There seems, therefore, to be ample evidence to show that if filters are constructed to conform the principles which have been laid down satisfactory results may be obtained. The reasonable view to be taken of the matter seems to be that, instead of any hard and fast rule being laid down, each case should be treated on its own merits; that if suitable land can be obtained it should be used, but that if it cannot be got artificial filters should be sanctioned, but with stringent restrictions as to the volume of sewage allowed on a given area." The Committee asked the Local Government Board to consider the views of these two gentlemen, and to say that no hard and fast rule should prevent the use of artificial filtration if

#### A SATISFACTORY SCHEME

were presented. It did not wish the Board to decide that all filtration should be artificial. It only wished the Board to have a more open mind on the subject, and so help the Committee in carrying on its difficult but important work. Sir H. Roscoe thought all persons would agree that the work of preventing river pollution was most difficult chemically, and, he supposed, from the engineering point of view also. The difficulties lay, not with the rural authorities, or even with the manufacturers, but, as far as Lancashire was concerned, with the seven county boroughs and their million and a quarter of population. Take the case of Manchester. The authorities, consulted him on the subject. The only land they could purchase, and which, in fact, they did purchase, was not fit for a sewage filter. Salford and other Lancashire towns were in the same fix. In addition to the want of sufficiently porous soil, our climate was against land filtration, and the most suitable land became water-logged. But artificial filtration could be carried out so as to produce an effluent which would not putrefy in hot weather. There was no doubt that by means of intermittent filtration that result could be reached. These being the facts, the Local Government Board should

#### NOT IN ALL CASES INSIST,

especially where dense populations were concerned, on land filtration. Each case should be treated on its merits, and that system permitted which was the most suitable. Mr. Tatton informed Mr. Russell that in the Mersey and Irwell watershed there had been many cases of buying land for sewage works, and being rewarded with failure. He believed the same experience had been met with on the lower reaches of the Mersey valley. Manchester, with a population of 500,000, would, according to the Local Government Board, need 500 acres, and yet that quantity would be totally inadequate. Thirteen hundred acres had been suggested, so that the city appeared to be in an extremely difficult position, especially considering what Sir Henry Roscoe had said as to the unsuitable nature of the soil and the impossibility of getting enough land. Dr. Hewett, speaking as specially representative of Cheshire, said the condition laid down by the Local Government Board had resulted in a deadlock. The Mersey and Irwell Committee had an action pending against the Salford Corporation for polluting the Ship Canal, in which a large bulk of sewage was now locked up, giving rise to putrescence and fermentation. The evil was increasing, and property in Cheshire had been seriously damaged by it. Salford's experts advised that

a satisfactory effluent water could be obtained from the sewage by precipitation and artificial filtration. Salford, however, could not borrow money to carry out the scheme which would be satisfactory to the Joint Committee as well as to itself—a difficulty created by the rule of the Local Government Board. This was the problem which the County Court Judges had to solve. Of course, if Salford could obtain suitable land for the natural filtration of its sewage, the Joint Committee would have no objection, but it could not. Oldham and Rochdale had taken land for that purpose, only to find it unfit. Under these circumstances it seemed absolutely necessary to permit artificial filtration. Precipitation alone

#### WOULD NOT PRODUCE A SAFE EFFLUENT,

but with artificial filtration it would. Public opinion in Manchester was much impressed with the proposal to ask Parliament next session for power to send the effluent water of the city's sewage to the estuary of the Mersey, but the Joint Committee held that to allow Manchester to remove its effluent in that way from the community would be unfair to other places in the watershed, where much expense had been incurred in meeting the requirements of the Joint Committee. Matters had reached a crisis which could only be abated by the Local Government Board. Mr. Russell replied that the immense importance of the question imposed great reserve upon him. He had given personal attention to it, visiting Radcliffe and Royton among other places, in order to see purification works. Up to the present the Local Government Board had held that land filtration gave the best result, but in recent years the Board had lessened its demand for land where chemical treatment was applied. The deputation said, with perfect truth, that it was difficult, if not impossible, to get land in the neighbourhood of enormous centres of population. There was a great deal in that. It placed on the Board a responsibility to examine the whole question afresh. The rise and progress of large towns created a difficulty which probably did not exist to the same extent when the Board's orders concerning the filtration of sewage were issued. The President (Mr. Chaplin) authorised him to say that the views of the deputation would receive immediate consideration.

At recent meetings of the Insanitary Areas and Sanitary Committees of the Leeds City Council, preliminary suggestions for another instalment of the insanitary areas scheme were briefly considered. The quarter proposed to be taken in hand is in the vicinity of Ainsley Street, Holbeck. It is about four acres in extent, and the inhabitants number about 1500. The matter was adjourned. Arrangements were made for improving the sanitary accommodation connected with the property that will survive the demolition of houses in connection with the Camp Field insanitary area undertaking.

At the meeting of the City Commission of Sewers a long and animated discussion ensued upon a report presented by a special committee as to the present system of dealing with dust and refuse from the City, and as to whether it was expedient to make any alterations therein. The committee having considered the system adopted in Glasgow, recommended that the refuse should be collected into the country by means of barges, and recommending that the committee negotiate for the acquisition, at a cost not exceeding £25,447, of the freehold of Farnchurch Marshes, near Barking, and the Romford Canal adjoining. Before the report was put, a letter was read from the South London Electric Supply Corporation, intimating their intention of applying next year for a Provisional Order to supply the City with electricity, and proposing, with the consent of the Commission, to utilise the City refuse in producing the light, as was the case in Shorelitch. After discussion, it was decided to postpone the consideration of the report with reference to the proposed purchase of land, and to merely enter the letter of the South London Company on the minutes.

#### NEW THEATRE FOR SWANSEA.

THE new Grand Theatre at Swansea, opened last week by Madame Patti, is erected on the site of the Drill Hall, Singleton Street, which was purchased from Colonel Pike by the firm, and the foundations of which were partially utilised in the new building. Mr. W. Hope has in this most commodious structure adopted the Renaissance style of Architecture, the materials used for the walls being white stone and red brick, faced with rough cast plaster. Dark red bricks are used at all angles, and terra-cotta has been freely used for the ornamental portions. An almost new departure has been made and a very pleasing effect produced by covering the roofs and towers with Swansea terne-plates, instead of the ordinary slates which have hitherto been used in theatre construction.

#### THE AUDITORIUM

of the theatre is in the form of a square, each side of which is 65ft. long, and consists of three floors, comprising on the ground floor stalls and pit, on the first floor the dress-circle, and on the upper floor the gallery. The plastic decorations in the interior of the building, which adorn the proscenium and the front of each tier, are exceptionally rich and elaborate. The modelling of the figures and forms in plaster is decidedly artistic; in the lower tier Cupids holding festoons of flowers, &c., with bold cartouche ornaments, and in the upper tier grotesque masks form the plastic treatment. These masks are delicately coloured in ivory tones, relieved with terra-cotta and blue tints lavishly gilded. The ceiling is treated in the florid French Renaissance style in finely modelled plastic work, and here, again, the colouring is very fine, the whole being richly relieved by massive gilding. The dress-circle is furnished with 300 comfortable tip-up arm-chairs, upholstered in brilliant red plush, and every one of them commands a perfect view of the stage. The pit seats are thoroughly comfortable, and are padded and upholstered in tapestry. Each section of the house is provided with lavatories for ladies and for gentlemen, and with a convenient refreshment-room.

#### THE STAGE

is most completely equipped, and to anyone not conversant with modern stage appliances is almost a revelation. The height from the cellar floor to the top of the roof is no less than 80ft., and the arrangements for handling the scenery with ease and despatch are ingenious and complete. The dressing-rooms are light, and are well ventilated. There are no less than five exits leading directly on to the street, and for each part of the building there is an exit on each side of the auditorium. It is calculated that the entire audience could easily leave the building within the short space of two minutes. All the staircases have been constructed of fireproof materials, and the "panic bolts" enable all the doors to be opened by the slightest push from the inside of the building. Hydrants are provided in every part of the building. The principal entrance leading to the stalls and dress circle is in Singleton Street, and will have a fine marble staircase and handsomely decorated walls. The floor and entrance lobby, with the landings and foyer, will be

#### PAVED IN MOSAIC TILES.

The gas and electric light arrangements on the stage are singularly practicable. From the switch-board every part of the "front of the house" and of the stage can be controlled. Each part can be lighted separately, or all parts can be lighted together. The appliances also enable varying strength of light to be used, and on the stage a variety of colours. The switch-board is not, as in the old-fashioned theatres, on the stage, but is placed on a kind of balcony some 8ft. above the stage, the lighting arrangements thereby being controlled from a position where the artistes and stage hands are not passing and re-passing, and a corresponding advantage is obtained by allowing additional stage room. This arrangement for checking the lighting is a very recent improvement, and is at present only in use at

Her Majesty's Theatre, and the Haymarket Theatre, London. The contractor for the building is Mr. S. Jenkins, of Swansea. The plastic decoration, the furniture upholstery, and the seating of the auditorium have been carried out by Messrs. A. R. Dean, Limited, of Birmingham.

## Surveying and Sanitary Notes.

AN inquiry was recently held at the Trustees Hall, Boston Spa, before Mr. W. Randall Slack, of the Local Government Board, as to the application of the Wetherby Union Rural Sanitary Authority for power to borrow £4500 for the purpose of carrying out a scheme of sewerage for Boston Spa. It was explained that the population of Boston Spa was at present 1500, but the proposed scheme would be sufficient to provide for a population of 3000. There was about 380 houses in the township, and for fifty of these the drainage now went into the River Wharfe. The remaining houses were drained into cesspools, and as a consequence about half of the wells in the township were polluted by the sewage which percolated into them. The cesspools would now be done away with, and a sum of about £50 per year which was spent in cleaning them out would thereby be saved. The lack of a drainage scheme for Boston Spa, had constantly been brought to the notice of the authority by the West Riding County Council and the Rivers Board, the latter body complaining of the pollution of the river by the drainage which now passed into it. The necessary land for the outfall works had been secured at a point in the neighbouring township of Bramham, close to the eastern boundary of the township of Boston Spa, and a provisional agreement has been entered into with Mr. Lane Fox to lease the land for twenty years at a rental of £30 per year. The plans and details of the proposed scheme were then explained at length by Mr. Mallinson, who stated that the outfall works would be on the broad irrigation principle.

At a recent meeting of the Keighley Rural District Council deputations from the Morton Parish Council and from a recent parish meeting at Morton attended and submitted an alternative scheme for the sewerage of the Morton district. This scheme has been drawn up by Mr. H. A. Johnson, engineer, of Bradford, as an alternative to that which has been adopted by the Rural District Council, and it was claimed that by its adoption a saving of from £800 to £1000 could be effected. It was decided that the scheme should be considered at a future meeting.

CANKLOW, a hamlet on the outskirts of Rotherham, is in need of a sewerage system. Houses have been rapidly run up for the accommodation of the miners, and there are indications that the builder has still plenty of work before him in this locality. Realising the need for better sanitary arrangements, it was decided to construct sewage works on the Magnetite process. The scheme has now been completed. Inclusive of the land, the scheme has cost £2200, and it is capable of dealing with a population of 4000. On its way to the tanks the sewage passes through a box containing a powerful chemical known as "Aelite," which, it is claimed, assists the precipitation of the sludge, and preserves the sewage from decomposition. Having passed through several tanks, the sewage leaves the last division in a fairly clear condition. A process of filtration follows, after which the liquid is run on to land, and finds its way into the river in a condition almost as clear as drinking water. At the opening Mr. Jubb spoke of the difficult problem which sewage disposal presented to local authorities, expressed his entire satisfaction with what he had seen of the Magnetite process, and concluded by assuring the engineer and others responsible for the work that if the scheme operated as satisfactorily five years hence the District Council would be delighted,

## COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
<b>BUILDINGS—</b>			
Aug. 6	Aberdare—Two Shops in Cardiff-street	Building Committee, British Schools	T. Roderick, Architect, Clifton-street, Aberdare.
" 6	Abergavenny—Alterations and Additions to Schools		E. A. Johnson, M.S.A., Architect, Abergavenny.
" 6	Croft, Carmarthen—Farmhouse	Christopher Ryall	Tenant.
" 6	Stowmarket—Villa Residence, Regent-street		H. G. Bishop, M.S.A., Architect, Market-place, Stowmarket.
" 6	Thornton, Yorks—Masonry for five Scullery Houses	Guardians	J. Drake and Sons, Architects, Queensbury.
" 6	Howden—Erection of Vagrant Wards		H. Green, Solicitor, Howden.
" 7	Fryston, near Pontefract—Lodge		J. G. Kelly, West View, Pontefract.
" 7	Hereford—Residence in Hampton Park	Corporation	Nicholson and Hartree, Architects, Hereford.
" 7	Jarrow—Wall & Alterations to Sheds at Willington Quay		J. Petree, Borough Surveyor, Jarrow.
" 7	West End, Morecambe—Portion of St. Barnabas Stone Church.		Austin and Paley, Architects, Lancaster.
" 7	St. Stephen's-in-Branwell, Cornwall—School, &c.	School Board	Sampson Hill, Architect, Redruth.
" 7	St. Swindon—Additions and Alterations to Queenstown Club College.		R. J. Beswick, M.S.A., Architect and Surveyor, Swindon.
" 9	Chester—Hospital, Sealand-road	Sussex Portland Cement Works	H. Beswick, Architect, Chester.
" 9	Heighton, Newhaven—Chimney Shaft, 120 feet high	Guardians	Manager of Works, Heighton.
" 10	Dover—Alterations, &c.	Guardians of Loxden and Winstree Union	E. Carder, Clerk, 17, Market-square, Dover.
" 10	Lexden—Drainage and Reflooring to Workhouse	Guardians of St. Mary, Islington	J. Ennals, Surveyor's Office, Copford.
" 10	Upper Holloway—Infirmary for 800 Patients, Highgate Hill	Great Western Railway Company	E. Davey, Clerk, Guardians' Offices, St. John's-road, Upper Holloway, N.
" 10	Plymouth, Millbay—Enlargement of Station, &c.		Engineer's Office, Plymouth Station.
" 10	Galway—Alterations to County Court House	J. Tidman	J. Perry, M.E., M.I.C.E., County Surveyor, Galway.
" 11	Gorleston—Six Cottages, Church-road	Guardians of Lurgan Union	W. B. Cockrill, F.I.A.S., Architect and Surveyor, Gorleston.
" 12	Aghalee, Lisburn, Ireland—Dispensary and Dispensary Residence at Folly Hill	Lords Commissioners of the Admiralty	E. J. Donaldson, Clerk, Lurgan.
" 13	Scarborough—Eight Dwelling-houses at Coast Guard Station		Director of Works Department, Admiralty, 21, Craven-street, London, W.C.
" 13	Flushing, Falmouth—Re-seating and Decorating Wesleyan Chapel		H. W. Collins, Architect, Penryn street, Redruth.
" 14	Clones, Ireland—Repairs to Tower and Spire of Catholic Church	Urban District Council	W. Hague, Architect, 50, Dawson-street, Dublin.
" 16	Cockermouth—Tool-house in Park	Guardians of Pontypool Union	Surveyor.
" 18	Pontypool—Alterations to Workhouse, Laundry, Hospital, &c.	Commissioners for the Control of Lunatic Asylums	Lansdown and Griggs, Architects, Metropolitan Bank-chambers, Newport, Mon.
" 20	Carlow, Ireland—Additions and Alterations to the Carlow District Lunatic Asylum		Board of Control of Lunatic Asylums, Custom House, Dub. in.
" 24	Trimdon Grange, Durham—Enlarging and Re-seating Wesleyan Chapel		W. R. Woodhead, Trimdon Grange.
No date.	Cork—New Roof, Flooring, &c., 6, North-mall	Norman and Pring, Exeter	K. D. Roche, Architect, Marlborough-street, Cork.
"	Exmouth—Railway Hotel		Kerley and Ellis, Architects, Exmouth and Salterton.
"	Ferrybridge, near Pontefract—Villa Residence		J. Greaves and Co., Architects and Surveyors, Cornmarket, Pontefract.
"	Ipswich—Additions to Rose-hill Schools	School Board	E. F. Bishopp, Architect, 32, Museum-street, Ipswich.
"	Llandrindod Wells, Wales—Hotel	Gwalia Hotel Limited	Swash and Bain, Architects, Midland Bank-chambers.
"	London, E.C.—Alterations to "The Three Tuns," Fium-street, Barbican.	J. Beer	G. Silvester, Surveyor, 46, Strand.
"	London, E.C.—Rebuilding "Rose and Crown" Public-house, Bartholomew-close.	Benskin's Watford Brewery Limited	Dear and Winder, Architects, 119, Great Russell-street, Bloomsbury, W.C.
"	Peterborough—Two Villas in Fletton-avenue	E. Toms	J. Ruddle, Architect, Boroughbury, Peterborough.
"	Peterborough—House, Shop, and Bakehouse, Buckle-st.	J. W. Tirrell	J. G. Stallebrass, Architect, Peterborough.
"	Rawdon, near Leeds—Four-terrace House, Apperley-lane		F. Mitchell, Architect and Surveyor, 71, Albion-st., Leeds.
"	Sheffield—Alterations to Heeley and Sheffield House, Gleadless.		W. T. Rhoden, Architect, Buckingham-chambers, St. James's-street, Sheffield.
"	Swansea—Additions and Alterations to St. Thomas's Church Schools.		J. Buckley Wilson and G. Moxham, Architects, 15, Castle-street, Swansea.
<b>ENGINEERING—</b>			
Aug. 10	Stonehouse, Gloucestershire—Footbridge over Railway	Great Western Railway Company	Engineer's Office, Gloucester Station.
" 12	Morecambe—Widening Pier, &c.	Pier and Pavilion Company Limited	Magnall and Littlewoods, Architects, 42, Spring-gardens, Manchester.
" 23	Romford—Construction of Reservoir, Pumping Station, &c.	Rural District Council	J. Simmons, 1, Prince's-street, Doncaster.
<b>IRON AND STEEL—</b>			
Aug. 10	Douglas, Isle of Man—Pipes and Appendages for Out-fall Sewer.	Corporation	Town Clerk, Douglas, or Messrs. Stephenson and Burstall, 38, Parliament-street, Westminster.
" 10	London, W.—Supply of 600 Steel Bridge Girders, &c.	Great Western Railway Co.	Engineer's Office, Paddington Station.
" 31	Saltcoats, Scotland—Supply of 600 Steel Galvanized Buckets.	Commissioners	J. Miller, Surveyor.
<b>PAINTING—</b>			
No date.	Greetland, Yorks.—Painting Cottages at Crosshill		J. Peel, Mount Pleasant, Greetland.
"	Holbeck, Leeds—White-washing Schools	Church School Managers	G. B. Cronshaw, 22, Cambrian-terrace, Caretaker.
"	Smithy Bridge, Lancs.—Painting, &c., U.M.F.C. School		
<b>ROADS—</b>			
Aug. 7	Desborough—Supply of Broken Granite (300 tons)	Urban District Council	T. Streather, Surveyor, High-street, Desborough.
" 9	Eccles, Lancs.—Paving Works, &c.	Highways Committee	Borough Surveyor's Office.
" 9	Liverpool—Supply of Broken Macadam (470 tons)	Little Woolton Urban District Council	J. Bourne, Surveyor, Grange-lane, near Liverpool.
" 9	London, W.—Supply of Broken Granite	Hanwell Urban District Council	Council's Offices.
" 9	Portland—Supply of Broken Granite for One Year	Urban District Council	E. J. Elford, Council Offices, New-road, Portland.
" 9	Batley—Road Works	Corporation	O. J. Kirby, Borough Surveyor, Market-place, Batley.
" 18	Burnley—Paving, &c.	Highways and Sewage Committee	G. H. Pickles, Borough Surveyor, Town Hall, Burnley.
" 23	Sunbury-on-Thames—Road Works, &c.	Urban District Council	J. Anstie, 17, Victoria-street, S.W.
No date.	Bacup, Lancs.—Re-flagging and Channelling Two Streets	Urban District Council	J. W. Eyre, Christ Church-street, Bacup.
"	Barnard Castle—Materials	Co-operative Society	J. I. Dawson, Council Office, Barnard Castle.
"	Castleford—Paving and Macadamising	M.S. and L. Rly. Co.	Offices, 28, Carlton-street, Castleford.
"	Ashton-in-Makerfield, Lancs.—Supply of York Flags (1500 yards).		J. W. Liversedge, Surveyor, Ashton-in-Makerfield.
<b>SANITARY—</b>			
Aug. 6	Barry, near Cardiff—Island Sewer Works	Urban District Council	C. E. Walker, Engineer, Barry.
" 16	Shipley, Yorks.—Sewers	Urban District Council	W. B. Woodhead & Son, Engineers, 18, Exchange, Bradford.
" 16	Shipley, Yorks.—Sewerage Works	Urban District Council	M. Paterson, Engineer, Bradford.
" 17	Luton—Drainage Works	Town Council	Borough Engineer's Offices, Town Hall, Luton.
Sept. 7	London, E.C.—Sewer	Shoreditch Vestry	J. R. Dixon, A.M.I.C.E., Surveyor and Engineer, Town Hall, Old-street, E.C.

## COMPETITIONS.

DATE DESIGNS TO BE SENT IN.	DESIGNS REQUIRED.	AMOUNT OF PREMIUM.	BY WHOM ADVERTISED.
Sept. 22	London, S.W.—Designs for Erection of Public Baths	£100, £50, £25	Vestry of St. Mary, Battersea, Municipal buildings, Lavender-hill, S.W.
Oct. 1	Morecambe—Plans, Estimates, &c., for Sewage System in District.	£100	Morecambe Urban District Council.
